partments, and have a horizontal division by the usual transom; the wooden roof is a splendid specimen of the kind; it is, perhaps, the earliest perpendicular roof we have. Of the late structures of this style, the Abbey Church at Bath is a specimen; it already exhibits some symptoms of a decline of the style; the tracery, and shapes of the windows, are heavy and tasteless. The foundation of Henry VII's Chapel, Westminster, was laid in 1502, but it was not completed till the reign of Henry VIII. It is the richest specimen of this style on a large scale, and is completely covered, externally and internally, with panel-work, niches, statuary, and other decorative work. But one of the most beautiful specimens of a late date, on a small scale, is the church of Whiston, Northants, built 1534, by Antony Catesby, Esq., Isabel his wife, and John their son. It consists of a tower, decorated with panel-work, and finished with handsome pinnacles at the angles; a nave divided from the aisles by arches within square compartments, the spandrels being filled in with foliated panels; these arches spring from piers, placed diamond-wise with semi-cylindrical shafts at the corners: there are no clerestory windows, and the chancel and aisle windows are obtusely-pointed four-centred arches. The wooden roof is a good specimen. Somersetshire is particularly noted for its many churches, erected at the close of the fifteenth or early in the sixteenth century: they are often rich in carved wood-work, whether of screens, pulpits or seats. The towers are especially fine, and decorated with great variety.

We have to say but a few words on the subject of the decline of Architecture. It commenced about the year 1530, and is but too readily recognized by a hundred various signs of decay. The designs generally now become clumsy and meagre, and show no appearance of a change from one style to another, but rather to none at all, or to a puerile mixture of styles, hardly deserving any name. One great cause of this decline of Christian art, was the devastation of monasteries, and other such institutions, which followed their suppression; this both discouraged the study of the art, which had grown up within their walls, and went far to put a stop to the spirit of erecting and enriching churches, which had flourished for so many ages in our land. For the revenues of the religious houses, which were always largely bestowed on this object, were now seized upon by the King, and given to private individuals, who squandered in licentious living, or vain pomp, the revenues once devoted to so different purposes; and, besides this, the erection of additional chapels to the churches, and the decoration of churches generally, by the pious munificence of individuals, were put an end to by the abolishment of ancient usages, and still more by the prevalence of the Puritanical spirit, which, taking its rise shortly after the Reformation, continued to increase till it reached its climax in the temporary overthrow of the Church and monarchy in the next century.

A common custom in the sixteenth century was the insertion of stones, bearing the date of any alterations made at this period, and for about a century after the Reformation: this custom enables us to pronounce with certainty in many cases, as to the time which must plead guilty to the disfigurement of our churches, by clumsy and unsightly alterations. Thus at Wolston Church in

Warwickshire, a fine decorated window has the tracery taken out, and two square-headed windows, one above the other, inserted instead; over the uppermost is the date 1577, over the lower, 1621. At Bilton Church in the same county, a fine window has been blocked up, and a heavy, clumsy, square-headed window has been inserted, over which is a stone slab with the date 1609. At Hilmorton, in the same county, is another similar instance; and here is also in the south wall of the tower (which is low, heavy, and clumsily built) a stone, with date of its erection, 1655. At this period also, was introduced a taste for classic details and emblems, which are frequently inserted with wonderfully bad taste and incongruity into buildings, calling themselves gothic. Thus, on either side of the east window of St. Peter's College Chapel, Cambridge, is a classic niche with emblems of heathen sacrifices about them. Several of the College Chapels in Oxford are built in this debased style—for instance, Brazen Nose, and Oriel. The windows at Oriel Chapel (one of them is round-headed) are filled with inelegant tracery, and the large oval openings in the heads being without the tracery proper to gothic tracery, have a bald and harsh effect. We will not multiply instances of the misapplication of detail and neglect of harmony of proportion which characterize the churches of the early part of the eighteenth century; they were often constructed of red brick, with urns, torches reversed, garlands, heads of oxen, and such like heathen emblems, carved in stone, and stuck here and there, by way of ornament to buildings, whose proportions seem to indicate a town-hall or an assembly-room, rather than a Christian Church.

THE LAST WORD OF THE SINGER.

CHAPTER II.

THE doctor, astonished at these mysterious words, was trying to soothe and console her, when the door of the room was thrown open with much noise, and a tall young man entered. His face was strikingly handsome, but a wild haughtiness darkened his features, his eyes rolled, and his hair hung carelessly over his brows. He had a roll of music paper in his hand, which he waved backwards and forwards before he found breath to speak. When the signora perceived him, she uttered a loud cry, which the doctor at first thought was from pain, but soon saw it was from joy, for a beautiful smile lighted up her countenance.

"Carlo!" she exclaimed, "Carlo! at last you have come to see me!"

"Wretched one!" replied the young man, stretching his arm majestically towards her, and flourishing the roll of music, "cease thy siren song—I come to judge thee!"

"Oh, Carlo!" said the signora, interrupting him, in tones soft and touching as the breathings of a flute, "how can you thus speak to your Giuseppa?"

The youth was on the point of replying, when the doctor, dreading the effect of such a scene on his patient, threw himself before him.

"Worthy Master Carlo," he began,—at the same time offering him his snuff-box,—“have the kindness to remember that Mademoiselle is in a state of health which renders such scenes far too exciting for her weak nerves.”

The young man looked haughtily at the speaker, and pointed the roll of music towards him, exclaiming, with a deep threatening voice,

"Who art thou, earthworm, who darest thus to come between me and my wrath?"

"I am the physician Lange," answered the other calmly, shutting the lid of his snuff box; "and in my title of 'Medicinalrath' I find nothing synonymous with an earthworm. I am master here as long as the signora is ill, and I tell you in good earnest, either to take your departure, or to modulate your 'presto assai' to a reasonable 'larghetto'."

"Oh! let him remain, doctor," cried Bianetti, in accents of agony. "Let him remain, do not irritate him. He is my friend. Carlo will do me no harm, although wicked men have spoken to him against me."

"Ha! so thou still dost venture to trifle with me? But know, a flash of lightning has burst open the door of this mystery, and has illuminated the dark night in which I wandered. Therefore was I not to be told from whence thou camest, and what thou wert! For this, thou didst shut my lips with thy kisses, when I asked about thy life! Fool that I am! to have been charmed by the voice of a woman, in which there is nothing but deception and lies! Only in the voice of man is there truth and virtue. Alas! alas! how could I thus be deluded by the roulades of a—"

"Oh, Carlo!" whispered the poor girl, "if you only knew how your words pierce my heart, how your horrible suspicions penetrate more deeply than the steel of the assassin!"

"Truly, it was quite right, sweet innocent," exclaimed the other, with a fearful laugh, "that thy lover should be blinded, in order that thou mightst treat him as it pleased thee! That Parisian, however, must be a clever fellow, that he after all found his gentle dove."

"This is going too far, sir," cried the doctor, taking hold of the madman: "walk instantly out of this room, else I shall call the people of the house to hasten thy exit."

"I am going, I am going," screamed the madman, pushing the doctor back, who luckily fell into an arm-chair behind him. "Yes, Giuseppa, I go, never more to return. Live a better life, or rather die, unhappy one, and hide thy shame in the grave; and in that other world, hide thy soul where I may never meet it, for in this world thou hast shamefully cheated me out of my love and of my life."

He uttered these words, waving at the same time the roll he held in his hand; but his wild, restless eye filled with tears as he threw a last look towards Giuseppa, and rushed, sobbing, out of the apartment.

"Run after him; bring him back," cried the signora; "my peace of mind depends upon it!"

"By no means," replied the doctor, rising from the arm-chair; "this scene must not be repeated. I shall prescribe a soothing mixture, of which you will take two spoonfuls every hour."

The unhappy Bianetti had sunk back on her pillow, her strength was utterly exhausted, and she again lost all consciousness. The doctor called in the waiting maid, endeavouring, with her aid, to restore her mistress to life; yet he could not refrain, while pouring out some essence, from scolding the servant well.

"Have I not commanded you most strictly to permit no one, no person whatever, to come in? and yet you admitted this madman, who has almost a second time killed your good signora."

"I have certainly let in no one else," said the girl weeping, "but him I could not refuse. My lady sent me three times to-day to his house, to entreat him to come, were it only for a few moments: indeed, I was obliged to say she was dying, and that she wished to see him once more before her death."

"Indeed! And who is then this?"

* A title given to certain physicians.

The signora opened her eyes. She looked now at the doctor, now at the servant, and then her eyes wandered searchingly round the room.

"He is gone, for ever gone," she sadly whispered. "Ah! dear doctor, go to Bolnau."

"How! what can you want with the unfortunate counsellor? He has suffered enough already on your account, since he is obliged to keep his bed: how can he help you?"

"I have made a mistake," replied Bianetti; "you must go to the foreign leader of the orchestra; he is called Boloni, and lodges at the Hôtel de Portugal."

"I remember I have heard of that person," said the doctor; "but what am I to do, or to say to him?"

"Say to him, I wish to tell him every thing—that he must come once more; but no, I cannot tell him myself. Doctor, if you—yes, I have confidence in you, to you I will tell all, and then you can repeat it to Boloni: will that not do?"

"I am at your command," answered the doctor; "whatever I can do to promote your happiness shall most gladly be done."

"Well, come early to-morrow morning; to-day I can speak no more. Farewell, then—yet stay one moment; Babette, give the doctor his pocket-handkerchief."

The girl opened a drawer, and handed to the doctor a yellow silk handkerchief, which perfumed the whole apartment with a rich scent.

"This is not my handkerchief," said Dr. Lange; "you are mistaken,—I have lost none."

"It must be yours," said the waiting maid, "for we found it last night on the floor; it belongs to no one in the house, and there was no other person here except you."

The doctor met the look of the singer, which rested on him in expectation of his answer.

"Might this handkerchief not belong to some other person?" he asked, looking steadfastly at her.

"Shew it to me," she said anxiously, "I never thought of that."

She examined the handkerchief, and found in the corner some initials entwined: she turned pale, and trembled.

"It appears you know this handkerchief, and the person who has lost it," continued Lange. "It may lead to something; may I take it with me? may I make use of it for that purpose?"

There seemed to be a struggle in the mind of Giuseppa. She reached out the handkerchief, then again drew it convulsively back.

"Be it so," she at length said; "and though that wretched one should come again, and strike my wounded heart more surely a second time, yet I will venture it. Take it, doctor. To-morrow you shall have some elucidation of this matter."

One may easily suppose how exclusively this sad event occupied the mind of Doctor Lange. His extensive practice became as burthensome to him, for the time, as it had formerly been a pleasure; for did not the numerous visits which he had to make before seeing the signora again prevent him from being with her at an early hour, to hear her details, and the explanation for which he was so impatient? Yet, as he had to visit at least thirty or forty different places, where he was sure of meeting with many persons, he thought to himself that he might as well listen to what was going on, as his patients and others would of course be making remarks about the Italian singer, and the events that had happened; he might likewise be able to gain some information about her friend, the director of the choir.

When the singer was spoken of, people shrugged their shoulders, and were more severe in their judgments in proportion to the disappointment they felt that nothing official or certain was yet known. Her rivals—and what distinguished vocalist, should she also be beautiful and only eighteen, has not many?—her rivals made the most malicious remarks. The more temperate said,

Strih, strah, stroh!
Summer-day comes once mo!
Violets and sweet flowers
They bring us summer hours.
We hear the keys a ringing,
Something for us they're bring-
ing;
Bretzel steeping in red wine,
And for us all dainties fine.

A golden table the master we
wish,
With plenty thereon of baked
fish.
We wish the mistress, since she's
so kind,
With linen her presses all deeply
lined.
The daughter we wish a husband
good,
Who'll hold her as dear as his
life's blood.
Strih, strah, stroh!
This day next year we are here
once mo!

"On summer-day, also," says Mr. Howitt, "two men go round, one dressed in moss and straw, as Winter, and the other in ivy, or other evergreen leaves, hung with garlands and ribbons, like our Jack-in-the-green; or rather, they go round in a sort of covering of this, out of which they can creep at pleasure; and in this form they beg from house to house."

Reading for the Young.

DORNIE BACH.¹

(See Engraving, p. 305)

AT a farm in Cowal, on the side of Loch Fine, opposite to the Duke of Argyle's beautiful castle, dwelt a cotter and his wife; poor persons of the lowest class of Scottish peasantry; yet though poor, they were loved and respected, for they were as obliging as industrious; and by their industry were frequently enabled to assist their neighbours—whom habits of expense or idleness had reduced to straits.

Such privations as they endured came light to them, because they referred all things to the will of God; and that singleness of heart and simplicity of belief blunts the edge of suffering, while it enhances the value of happiness. Next to this blessed resignation of mind, the best boon of Heaven is, perhaps, a love of employment; for labour, when it is not too severe, beguiles care. Come when you might to Gillespie's cottage, you always found the good man and the good wife busy: as often as Gillespie dived in the potato-yard, he might be heard singing,

"A cosie wee house, a cosie wee fire,
A bonnie wee bodie to praise and admire;
A sonsie braw bairn upon my knee,
To crowdie, and cry Daddie to me;
And bide ye yet, and bide ye yet,
Ye little ken what may betide ye yet:
A bonnie wee bodie has been my lot,
And I'll ay be canty wi' thinking o't."

And *canty*—that is, cheery—he ever was, for there is a spirit in employment which gives health to the mind, as exercise does to the body; besides, there is a promise attached to diligence: "The hand of the diligent shall bear rule, but the slothful shall be under tribute." (Prov. x. 24.) But, to return to my story and my cotters. They had two fine children—the pride, and joy, and comfort of their lives—a boy and girl. The girl was ten years old, the boy seven; already these children were useful in their family and station. Many a well-dressed lordling and little lady cannot say as much; happier would it be for them if they could. The girl helped her mother in the kale-yard in the daytime, and at night spun the yarn "*maist as weel as herself*." The little boy lay all day patiently herd-

ing his sheep and the black cattle, and was already as perfectly acquainted with the wilds and hill-side as boys that were twice his age.

He was a fearless little fellow, and when accompanied by his faithful black and white collie,² "Dornie Bach," he apprehended no danger—no, not even when he passed the cairn, where it is said a poor girl, in a fit of insanity, had killed herself: and yet such a sad tale might naturally make a child feel awe; but he remembered what his father had told him, and what he read (for he could read) in his Bible, that they who do no wrong need fear no evil; so he played with his dog, and cut hazel-sticks, and gathered fern to make a bed for the cattle when he should return at night, which he carried home on his back, bound together with a withe of the birch-tree; at other times he gathered wild-ash berries, and strung them in necklaces for his sister: their bright scarlet colour pleased his eye; and there was besides a virtue ascribed to this tree, according to Highland lore, which could keep all hurtful things from her.

Such notions arise out of the wild romantic features of that country, the lonely lives of the Highlanders, and the proneness mankind have to commune with some kindred spirit; so that when society is denied to them, they make to themselves creatures of their own imagination, spirits of good and evil, out of trees, and stones, and rocks, and nature, and derive interest and pleasure from these, which the dweller in busy cities can have no idea of.

These children had learned many lessons taught by Nature; they knew well the aspect of the heavens, and without any clock could almost always tell the hour of the day; they knew well also when to expect a storm, and when to drive their beasts to a place of safety before its coming fury; they instructed their dog, Dornie Bach, too, in his duties; and it would have been a dainty sight for a painter to have seen the grave face of the collie, one ear cocked up, the other down; his tail "hung o'er his hurdies wi' a swirl," as he listened to the commands of his young mentors, while they, by gesture and sound of voice, could make him understand everything they required of him.

The children were the happiest of the happy. After a day of freedom and delight spent in the moors, as was often the case, they did not return home empty-handed: Johnnie's bundle of fern was always larger than on other days, and his sister was laden with a pint stoup of blueberries for her mother, who dearly loved to eat them with a bowl of thick cream.

Mrs. Gillespie was celebrated for making a particular sort of cheese, which was considered a great dainty; and one of these cheeses, together with one of the famous Dornie Bach's offspring, was designed for some friends that dwelt across the moor, over the hills to the north, in the wildest part of the country. These were presents of no mean value, for Dornie Bach was of rare quality, and so was the cheese, and Mrs. Gillespie took counsel with her husband to decide whom she would entrust with such valuable gifts.

"There's not one I would sooner trust than Elspey," said her father; "that child never told an untruth in her life, and she's trustworthy in every sense of the word."

(1) From the *Christmas Box*.

(2) A particular species of sheep dog, famous for sagacity, immortalised by Burns.

Elspey gloried in her father's praise, and she felt her eyes fill with tears of modest joy.

"But it's a lonesome way for the bairn," said the mother; "I would go myself but for the sickness of our neighbour M'Arthur's wife."

"And I," said the father, "must go to the fishing, or the meal-chest must stand empty."

"Oh," cried Johnnie, "I've got my stick and Dornie Bach, and we'll take very good care of Elspey; there's nothing will harm us."

His sister joined her entreaties to be allowed to go; and after much demurring, it was decided that Elspey and Johnnie should set off early the next morning. Elspey carried the basket in which the cheese was deposited, and Johnnie took charge of the pup—young Dornie Bach—who was not able yet to follow on foot. Many were the directions the parents gave their children when they departed on their little journey, not to loiter on the way, but to behave "*wise-like*;" and, blessing them, they departed. Johnnie was often tempted to run here and there, and cut a stick, or fly a stone for Dornie Bach the elder, but his sister restrained him as much as she could; and they had reached nearly half way in safety when a violent storm of sleet and snow came on: it drove right in their faces, and blinded them so that they could not see, and in a very short space of time the whole surface of the earth was one glittering sheet of snow; here and there a point of a bush or brier was to be seen, but no track by which to guide these hapless children to their destination remained visible.

They continued to wander far and wide; far, indeed, out of their road, among bogs and morasses, which would have swallowed them but for the frost and their light weight; and they endeavoured to wade on through the drifting snow without knowing whither.

Night set in, and they had no shelter. Then, for the first time, Johnnie began to weep bitterly; and, though Elspey still endeavoured to comfort and keep up his spirits, he complained of cold and hunger till her very heart ached for him—much more for him than for herself, although she was suffering likewise; but he was younger, she said, and it was no wonder his courage and patience gave way under such trials. He besought her to let him eat the cheese. "What, Johnnie! the cheese we were to take in safety to Donald Bawn; ye would not think of that!" and she endeavoured to explain to him that one must sooner die than break a trust. She assured him that she was as hungry as he could be, but bade him place confidence in God, and remember that ere long, doubtless, their parents would seek them out and save them; and in this belief she rested, finding it utterly impossible to use any exertions in their own behalf.

Down they sat, therefore, just where they chanced to be, under a rock, determined, as Elspey said, to await God's will. She now took off her plaid, and all her upper garments, to cover her brother, who had fallen asleep; and the only relief she kept for herself was the least of the two dogs, whom she placed across her breast. The faithful Dornie Bach was his little master's comforter. All that night they were exposed to the inclemency of the season; but providentially for them a mass of snow fell from the rock under which they sat, and buried them in its bosom. This supplied the place of

covering, and saved their lives. Johnnie slept on, but Elspey continued (to use her own words) to "call on the name of God" all that night.

It was not till the middle of the next day that the parents and the inhabitants of the whole country round, whom they had called together, came to the spot where the children lay; they made the air ring with their shouts, but the little ones were no longer able to make themselves heard. Johnnie, indeed, his sister feared, was dead; but Dornie Bach saved them: he barked faintly—his bark was heard, and joyfully cheered. The children were dug out of their snowy bed; and the half-distracted parents expressed their joy in alternate thanks to God, and to those who had assisted them in their search. Johnnie recovered; and after proper care Elspey too became once more the stout lassie she had ever been, except a slight turn in her head, which remained an honourable mark of her heroism for the rest of her life.

It may be doubted whether she should not have let her brother eat the cheese; but she said, "Life was worthless without honour; and besides, I trusted in God for delivery."

POEMS AND PICTURES.¹

Who is there that, in his fond recollections of the home of his childhood, does not, among all the memories connected with those happy days, give a cherished place to the large book full of pictures, which it was his highly prized privilege and reward, after a well conned task or some other special good conduct, to be permitted to carry off to his own corner, that he might there gloat over its fascinations till bed time? It was, indeed, a perennial spring of delight, which never palled upon the sense, and never stinted in its flow. The more familiar those representations became to the eye, the greater was the enjoyment they afforded. The plumed warrior, contending in mortal struggle with his foe,—the gallant ship, with sails full set, nobly breasting the waves,—the regal lion, pacing the desert sands in solitary majesty,—the striped tiger, or spotted leopard, creeping through the thicket, and gathering his crouching limbs beneath him for a spring upon his unsuspecting prey,—the gaunt and hungry wolf, pursuing, with long unwearied gallop, the retreating sledge over the snow,—the eagle, screaming with fierce delight, as he drove his talons into the heart of his helpless victim, and bore it aloft to his rock-built eyrie;—each of these, as it told through the eye its tale of fear, or wonder, or sorrow, stamped deep and clear an impression upon the childish mind, which not all the long years of after life, and all the rough friction undergone in buffeting with the world and its cares, have been thenceforth able to efface.

The keen susceptibility of enjoyment which admits so many pleasures to the mind through the avenue of the senses, is the especial privilege of our early years. In after life, the number of our directly pleasing sensations decreases, and the intensity of the pleasure conveyed through such as remain becomes weakened, day by day. Our senses become deadened to the capacity of enjoyment, and our taste, grown fastidious, becomes more observant of blemishes which mar and destroy it. But we have, even then, a compensation for the absence or rarity of direct present gratification of this kind, in the memory of those enjoyments which are past. The mind, with providential frugality, husbands its store of early pleasures, and preserves the impressions of them with care, to be reproduced and renewed, when the path by which they were wont to be conveyed from without

(1) Discreetly, properly.

(1) "Poems and Pictures." London; James Burns. 1846.

becomes choked up,—when the dulled sense forgets its office, and the mind itself, wearied and exhausted, no more cares to look abroad for new objects of delight. Then it is that we feel the value of those impressions, long forgotten, perhaps, but never effaced, which were stamped upon the mind in youth. A new fountain of enjoyment is opened to us. The recollection of pleasure supplies the place of the sense of it, and, as present impressions of beauty become dim and indistinct, a reflected light brings back old ones subdued and mellowed before the eye; we return, in a far better sense than is usually attached to the words, to a second childhood, and live over again, in the renewed feelings of days long gone by, the best and happiest portion of our lives.

It is thus that, while in appearance we are only amusing a child, we may in reality be providing a store of enjoyment for an old man. Every happy day we give to the one, is the pledge of many an oft-returning feeling of tranquil pleasure to the other. How much importance does not such a consideration attach even to the trifles by which we endeavour to catch the attention of children,—to every thread which is woven into that chord of association between inward feelings and external objects, which, first sounded in early years, ceases not to vibrate, and to convey to the innermost seat of feeling its never-failing thrill of pleasure or pain, while life remains! How much of the destiny of the man does he hold in his hands, who has the power of directing the first associations of the child! But this is rather leading us away from our present purpose, which is merely to suggest how objects which the wise among us are apt to deem too trivial to deserve much attention, things apparently fitted only for the momentary gratification of beings who are "pleased with a rattle, tickled with a straw," may, perchance, be in their results the most important things of all; transmitting over the whole region of life an influence more extended and more powerful than the greatest and most momentous events; just as it may be that the character and social condition of a people may be more powerfully influenced by their nursery ballads, than by the most solemn acts of their legislature.

It must not be supposed, from what we have said, that the book now before us is one for children; or that its value consists, by any means, in its fitness to amuse or please the young. But it is a book of pictures, and more, it is one full of pictures;—and thus, by a natural association, carried us back to those early days, when, we shall not say such a book,—for there were no such books then,—but a book so filled with pictorial enchantments, with its borders, head and tail pieces, and initial-letters, adorned with intricate tracery of leaves and flowers, in which we were perpetually making new discoveries of little faces peeping out from the corners, and other the like wonders, was to us an exhaustless treasury of delights, and a source of thoughts, and feelings, and anticipations of a world yet untried, of which, if the stream has now run dry, the channel remains as distinctly marked as ever.

The prevailing fashion of profusely illustrating almost every kind of publication, if it indicates that we have become highly luxurious in our literary appetites, that we think it necessary to recommend the plain intellectual fare which sufficed for our fathers to our palates by all manner of piquant sauces and elaborate condiments, must be acknowledged to be, in many respects, a great improvement upon the old mode of managing these matters. Where the execution is meritorious, our enjoyment is heightened by the contemplation of so much additional talent employed in presenting the subject to our minds; as, in seeing a well acted play, we have, added to the pleasure derived from the beauty of the language, the development of the plot, and the interest of the dialogue, the still further gratification of witnessing the successful embodiment of feeling and passion, and the vivid representation to our senses, by voice and gesture, of that which was before more dimly

exhibited to our bare understanding. We have the tale twice told to us, with so much of a difference—once to the ear and once to the eye,—that the effect is equal to that of perfect novelty. Nay, we know not whether there is not, in beholding our own dim conceptions of an admired scene or description assuming form and body under the artist's pencil, and standing out in living reality before us, a pleasure greater than we should have derived from an entirely new and equally successful effort of the same genius which first created it for us.

A more beautiful book than this of Mr. Burns's we have never seen. It is a volume of poems, partly original, partly selected; and, of course, of very various merit;—but almost all worthy of a place in a book, not intended to be read through once and then laid aside, but to be returned to over and over again. The poems, however, are but a secondary attraction; the beauty of the book consists in its illustrations; which are crowded upon it with a lavish profusion altogether astonishing when we consider their uniform excellence. There is scarcely one of these illustrations—we do not know that we should make even one exception—which, by itself alone, would not be a very valuable ornament to any publication; when we state that there are a hundred such, (exclusive of ornamental borders to each page, of endless variety of design) in a quarto volume of two hundred and fifty pages, the attraction which such a book must present to the lovers of art will be easily estimated. We see from Mr. Burns's list of artists and engravers, that almost every name of eminence in this department of art has been employed upon his book, and the result is worthy of their united talents. We can with difficulty conceive that engraving on wood can be carried to a higher pitch of excellence.

We have been favoured with Mr. Burns's permission to transfer some specimens of his illustrations to our pages. We give at present the illustration of a poem by Professor Whewell, which originally appeared in a volume entitled "The Tribute," edited by Lord Northampton, and which, borrowed by Mr. Burns from that source, we now borrow from him. Carefully as the illustrations in this Magazine are always printed, we fear we shall scarcely succeed in conveying an adequate idea of the effect which this one produces on Mr. Burns's hot-pressed pages.

THE SPINNING MAIDEN'S CROSS.

(See Engraving, p. 320.)

BENEATH Vienna's ancient wall
Lie level plains of sand,
And there the pathway runs of all
That seek the Holy Land.
And from the wall a little space,
And by the trodden line,
Stands, seen from many a distant place,
A tall and slender shrine.¹
It seems, so standing there alone,
To those who come and go,
No pile of dull unconscious stone,
But touch'd with joy or woe;
Seems to the stranger on his way,
A friend that forth hath set,
The parting moment to delay,
And stands and lingers yet.
While to the long-gone traveller
Returning to his home,
It seems with doubtful greeting there
Of joy and sorrow come.
Smiles have been there of beaming joy,
And tears of bitter loss,
As friends have met and parted, by
The Spinning Maiden's Cross.

(1) A Gothic cross of the architecture of the thirteenth century, somewhat resembling Queen Elinor's crosses in England, stands at a little distance outside the city of Vienna, and is commonly called "Die Spinnerinn am Kreuz."

Young Margaret had the gentlest heart
Of all the maidens there,
Nor ever fail'd her constant part
Of daily toil and prayer.

But when the Sabbath-morn had smiled,
And early prayer was o'er,
Then Marg'et, gentle, still, and mild,
Had happiness in store.

For then with Wenzel side by side
In calm delight she stray'd,
Amid the Prater's flowery pride,
Or in the Augarten's shade.

"Gretchen beloved! Gretchen dear!
Bright days we soon shall see;
My master, lord of Löwethier,
Will link my lot with thee.

And there, upon the Kahlen's swell,
Where distant Donau shies,
He gives a cot where we shall dwell,
And tend his spreading vines."

Though joy through Margaret sent a thrill,
And at her eyes ran o'er,
Few words she spoke for good or ill,
Nor Wenzel needed more.

But when again the Sabbath-bell
Had struck on Wenzel's ear,
A sadder tale had he to tell,
And Margaret to hear.

"Gretchen beloved! Gretchen dear!
Joy yet;—but patience now;
My master, lord of Löwethier,
Has bound him with a vow;
And he must to the Holy Land,
Our Saviour's tomb to free;
And I and all his faithful band
Must with him o'er the sea."

A swelling heart did Margaret press,
But calm was she to view;
Meekly she bore her happiness,
Her sorrow meekly too.

Her solitary Sabbaths brought
A prayer, a patient sigh,
As on the Holy Land she thought,
Where saints did live and die.

But from the Holy Land soon came,
Returning pilgrims there,
And heavy tidings brought with them
For Margaret's anxious ear.

For Wenzel is a captive made
In Paynim dungeon cold,
And there must lie till ransom paid
A hundred coins of gold.

Alas for Margaret! should she spin,
And all her store be sold,
In one long year she scarce could win
A single piece of gold.

Yet love can hope through good and ill,
When other hope is gone;
Shall she who loves so well be still,
And he in prison groan?

She felt within her inmost heart
A strange bewilder'd swell,
Too soft to break with sudden start,
Too gentle to rebel.

And what she hoped or thought to earn
Poor Margaret never knew,
But on her distaff oft she'd turn
A thoughtful, hopeful view.

And by the stone where last they met,
Each day she took her stand;
And twirl'd the thread till daylight set,
With unremitting hand.

Her little store upon the stone
She spread to passers-by;
And oft they paused and gazed upon
Her meek and mournful eye.

And e'en from those who had but few,
Full oft a coin she won,
And faster far her treasure grew
Than e'er her hopes had done.

Through shine and rain, through heat and snow,
Her daily task she plied;
And wrought for two long twelvemonths so,
And then she gently died.

[But all in vain it grew, alas!
Her destined ransom store;
For from the Holy Land there pass
The travellers once more.]

And when to her their news they said,
All cheer and hope were gone;
For Wenzel is in prison dead,
His captive sorrows done.

Then on her face what woe was set!
Yet still she spun and spun,
As if her hands could not forget
The work they had begun.]

They took the treasure she had won,
Full many a varied coin,
And o'er the stone where she had spun,
They raised that shapely shrine.

And still Vienna's maids recall
Her meekly suffer'd loss,
And point the fame beneath the wall—
THE SPINNING MAIDEN'S CROSS.

Rev. W. Whewell.

[1 This and the three following stanzas, do not appear in Mr. Burns's book, nor in the Tribute. They have been kindly supplied to us by Professor Whewell himself.]

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—Montaigne.

NEW-YEAR'S EVE.

An old man stood at the window, at midnight, between the old and new year, and cast a long look of despair towards the immovable starry heavens above him, and upon the pure, white, silent, earth beneath, on which there was none so joyless, so sleepless as himself. For his grave was close beside him, it was covered only with the snow of age, not with the verdure of youth; and he had brought nothing with him out of a long and busy life, nothing but errors, sin, and disease; a wasted body, a barren soul; a breast full of poison, an age full of remorse. His fair youthful days stood before him like ghosts, and dragged him back again to that young bright morning, when his father placed him upon the diverging road of life, which, on the right hand, leads along the bright and sunny path of virtue to the land of light, and of good angels; and, on the left, conveys the traveller down among the mole-hills of vice, into a black cavern, full of dropping poison, of hissing snakes, and of dark oppressive vapours.

Alas! the serpents hung upon his breast, and the poison-drops upon his tongue, and he knew now where he was!

Horror-struck, and in tones of inexpressible anguish, he looked up to heaven, and exclaimed, "Give me my youth again! Oh, my father, place me again upon that starting-point of life, that I may choose otherwise!"

But his father and his youth had long since departed. He saw *Ignis-fatuus* dancing upon the moraine, and disappearing in the churchyard, and he said, "Those are my foolish days." He saw a shining star shoot from

See page 318

heaven, and fall down extinguished on the earth. "That is myself," said his bleeding heart, and the serpent-fangs of remorse pierced deeper into its wounds. His excited fancy showed him night walkers gliding upon the roofs, and the windmill seemed to lift its arms threateningly towards him, while a solitary skull, that had been left behind in the empty charnel-house, gradually assumed his features

In the midst of his horrors, there sounded suddenly from the church-tower, the music of the new year, like distant holy hymnings. He became softened and more composed. He gazed around upon the horizon, and upon the wide earth, and he thought of his early friends, who, as teachers of their fellows, fathers of happy children, honest and virtuous men, were all happier and better than himself; and he said, "Oh! I, too, on this first night of the new year, might have fallen asleep, like you, with dry eyes, if I would. I, too, dear parents, might have been happy, if I had followed your new-year's wishes and counsels."

In this feverish recollection of his youth, it seemed to him as if the skull, with his features in the charnel-house, raised itself; and, at length, the superstition which, on New-Year's Eve, sees ghosts, and the events of the future, gave it the form of a living youth, in the attitude of the beautiful sculptured boy of the capital, who is taking a thorn out of his foot. He fancied he saw his own blooming youthful figure represented in bitter mockery before him.

He could bear to look at it no longer; he covered his eyes; thousands of scalding tears streamed upon the snow; and, in low, broken, despairing tones, he sighed out, "Oh! come again, my youth, come again!" And it came again; for he had only been dreaming a horrid dream on this New-Year's Night: he was still a young man. But his errors were no dream; and he thanked God that he had still time left to retrace the

steps he had taken in the dark passages of vice, and to place his feet upon the bright sunny path, which leads to the pure land of blessedness.

Turn back with him, young reader, if thou hast entered, like him, upon the path of error, otherwise, this frightful dream will, in future, be thy judge, and then, if, with a voice of anguish thou shalt cry, "Return again, fair youth,"—Alas! it will never return!—*Jean Paul*

EDUCATION.

THELWALL thought it very unfair to influence a child's mind by inculcating any opinions before it had come to years of discretion to choose for itself. I shewed him my garden, and told him it was my botanical garden "How so?" said he; "it is covered with weeds." "O," I replied, "that is only because it has not yet come to its age of discretion and choice. The weeds, you see, have taken the liberty to grow, and I thought it unfair in me to prejudice the soil towards roses and strawberries."—*Coleridge*.

To be humble to superiors, is duty; to equals, is courtesy; to inferiors is nobleness; and to all, safety, it being a virtue, that, for all her lowliness, commandeth the souls it stoops to.—*Sir Thomas More*.

SKETCH OF THE LIFE OF LORD COLLINGWOOD.

THE most interesting description of biography is that which deals most largely with the private life of public men, and which exhibits them to us most clearly in those familiar relations which are common to them with the general herd of mankind. The subject of the biography must have borne, in some degree, a public character, otherwise its deficiency in dignity fails to invest it with such interest as will command general attention. We cannot bring ourselves to care much for commonplace details regarding men who have nothing that is not commonplace in their histories. On the other hand, if the life of the individual is merely used as a guiding line along which to trace the narrative of public and historical events, then it is nothing else than history, imperfectly and inadequately written. That biography is the most successful, which, laying before us most fully the feelings, affections, and passions, the points of weakness and strength, of men, whom otherwise we should know only in their connexion with, and as influencing the course of, the great and stirring events which affect the fortunes and determine the struggles of nations, throws most of a human interest over characters whose position somewhat tends to raise them out of the region of general sympathy.

It is not every man, however, whose biography can thus be written. There are some in whom the private

individual is so entirely absorbed by the public man, that, were we to exclude from the record of their deeds all that is not matter of general history, we should leave little or nothing worth knowing. Such men are mere historical monuments, convenient—perhaps necessary—for giving some degree of individuality of interest to historical events; if very eminent or very successful, then, it may be, concentrating in their own persons the greater part of the historical interest of their day of glory; but as *men*, having human hearts in their bosoms, and standing towards other men in the varied relations of private life, we know them not, or care not for them; the marble effigies, which remain to represent them in the national depositories of memorials of the illustrious dead, are not less interesting to our feelings.

Corresponding to the interest which we take in all that is purely personal to public men, is the pain with which we are too often obliged to pass from feelings of gratitude for great public services, and of admiration for splendid achievements in statesmanship or war, to those of stern moral reprobation for personal vices, or of compassion and humiliation for lamentable weaknesses and inconsistencies. The jar which is occasioned to our whole moral frame, by the encounter of feelings so opposite to each other, is one of the most unpleasant experiences to which the student of history, or of human

to write a line or two very often, to tell me how she does. I am quite pleased at the account you give me of my girls. If it were peace, I do not think there would be a happier set of creatures in Northumberland than we should be." Again: "It is a great comfort to me, banished as I am from all that is dear to me, to learn that my beloved Sarah and her girls are well. Would to heaven it were peace! that I might come, and for the rest of my life be blessed in their affection. Indeed, this unremitting hard service is a great sacrifice, giving up all that is pleasurable to the soul, or soothing to the mind, and engaging in a constant contest with the elements, or with tempers and dispositions as boisterous and untractable. Great allowance should be made for us when we come on shore; for, being long in the habit of absolute command, we grow impatient of contradiction, and are unfitted for the gentle intercourse of quiet life. I am really in great hopes that it will not be long before the experiment will be made upon me, for I think we shall soon have peace; and I assure you that I will endeavour to conduct myself with as much moderation as possible. I have come to another resolution, which is, when this war is happily terminated, to think no more of ships, but pass the rest of my days in the bosom of my family, where, I think, my prospects of happiness are equal to any man's." Almost every letter which he wrote at this period is in the same strain.

The peace of Amiens gave him a short enjoyment of the two great objects of his desire—peace and home. The short period of happiness and rest he then enjoyed, he employed in superintending the education of his daughters, and in continuing habits of study, which had long been familiar to him, and the fruits of which are very visible in his exceedingly well-written letters. On the recommencement of hostilities in 1803, however, he was again called away into active service.

We shall not dwell on minor incidents, but proceed to the next great event of his life—the battle of Trafalgar. He was here, as is well known, second in command to Nelson; and upon him devolved the task, a melancholy and painful one it proved, of completing the victory which Nelson lived only long enough to render certain. We cannot burden this brief sketch with details of mere fighting: it will be understood at once that Collingwood behaved with his usual distinguished gallantry, and justified to the full the confidence which Nelson reposed in him, which was, he said, as great as one man could have in another. Admiral Collingwood, on succeeding to the command, issued a general order immediately after the battle, appointing a day "of general humiliation before God, and thanksgiving for his merciful goodness, imploring forgiveness of sins, a continuation of his divine mercy, and his constant aid to us in defence of our country's liberties and laws, without which the utmost efforts of man are naught." The day after the battle a violent storm sprung up, which rendered it impossible to secure the prizes; and most of them escaped, though in a wretched condition, or were sunk. The kindness with which Collingwood treated such prisoners as fell into his hands, elicited the warmest expressions of gratitude from the Spanish officers on the coast, and was the source of an abundant return of good services to the English. He thus writes to his father-in-law: "To alleviate the miseries of the wounded, as much as in my power, I sent a flag to the Marquis Solana, to offer him his wounded. Nothing can exceed the gratitude expressed by him for this act of humanity: all this part of Spain is in an uproar of praise and thankfulness to the English. Solana sent me a present of a cask of wine; and we have a free intercourse with the shore. Judge of the footing we were on, when I tell you he offered me his hospitals, and pledged the Spanish honour for the care and cure of our wounded men. Our officers and men, who were wrecked in some of the prize-ships, were most kindly treated: all the country was on the beach to receive them; the priests and women distri-

buting wine, and bread, and fruit, amongst them. The soldiers turned out of their barracks to make lodging for them; whilst their allies, the French, were left to shift for themselves, with a guard over them to prevent their doing mischief."

A letter from the king's private secretary, Colonel Taylor, conveyed to Admiral Collingwood his majesty's warm admiration of his conduct during and after this engagement; and the Duke of Clarence presented him with a sword, an honour he had previously conferred on Earl St. Vincent and Lord Nelson under similar circumstances. He was raised to the peerage; received the thanks and freedom of the principal cities of Great Britain; and a pension was granted by parliament of 2,000*l.* per annum for his own life, and, in the event of his death, of 1,000*l.* per annum to Lady Collingwood, and of 500*l.* per annum to each of his two daughters. We cannot refrain from quoting the letter which he wrote to his wife on this occasion:—"It would be hard if I could not find one hour to write a letter to my dearest Sarah, to congratulate her on the high rank to which she has been advanced by my success. Blessed may you be, my dearest love, and may you long live the happy wife of your happy husband! I do not know how you bear your honours, but I have so much business on my hands, from dawn till midnight, that I have hardly time to think of mine, except it be in gratitude to my king, who has so graciously conferred them upon me. But there are so many things of which I might justly be a little proud,—for extreme pride is folly,—that I must share my gratification with you. The first is the letter from Colonel Taylor, his majesty's private secretary, to the Admiralty, to be communicated to me. I enclose you a copy of it. It is considered the highest compliment the king can pay; and, as the king's personal compliment, I value it above every thing. I am told, that when my letter was carried to him, he could not read it for tears, joy and gratitude to Heaven for our success so entirely overcame him. I have such congratulations, both in prose and verse, as would turn the head of one a little more vain than I am.—How are my darlings? I hope they will take pains to make themselves wise and good, and fit for the station to which they are raised."

This was the last of Lord Collingwood's battles. The remainder of his career of service was spent in a manner less congenial to his taste, though probably not less important to the interests of the country, in watching the operations of the enemy in the Mediterranean, counteracting their designs, promoting the political views and upholding the influence of his government, encouraging and supporting their allies, and overawing their enemies. The mass of business, which these numerous employments heaped upon his shoulders was too much for his strength. His constitution was naturally a very hardy one, but it had been undermined by the long hard service he had passed through, and it gave way altogether under this accumulation of new and harassing labours. The constant confinement on board ship, and long bending over a desk, while engaged in his voluminous correspondence, (for so high was the opinion entertained of his judgment that he was consulted from all quarters, and on all occasions, on questions of general policy, of regulation, and even of trade,) brought on a contraction of the pylorus, which occasioned him the greatest suffering. Still he remained unflinchingly at his post: his friends repeatedly urged him to surrender his command, and to seek in England that repose which had become so necessary in his declining health, but he would not make any attempt to quit the station which had been assigned to him until he should be duly relieved, urging, that his life was his country's, in whatever way it might be required of him. It was only when he became literally unable to bear the slightest fatigue, and an immediate return to England was declared necessary to preserve him for any time in life, that, on the 3d of March, 1810, he surrendered his command. But it was now too

late; for he expired within four days after, at the age of fifty-nine, with a calmness and composure which was as remarkable as the heroism of his life, after having served his country fifty years, of which forty-four were passed in active service.

There never yet was a man who made greater personal sacrifices for the service of his country than Collingwood. To the fearlessness and contempt of danger of a British sailor, and the sound judgment and prudence of a wise statesman, he added the suffering constancy of a martyr. It was not merely that he continued working at his post long after his failing health warned him that it was time to retire, but that he did so in spite of the most powerful and tender inducements. He was no mere Commodore Truncheon, so wedded to the sea as to be unable to appreciate or enjoy the pleasures of quiet and retirement. His heart was ever a-thirst—panting as the hart after the water-brooks—for the delights and endearments of home. He would have given anything to be able to return and spend his days with his wife and children, but he could not sacrifice his sense of duty even to so cherished an object as that. For this his name will ever be honoured by all who can appreciate the rare union of the loftiest courage, and the most unflinching perseverance in duty, with the tenderest feelings of the heart; and few will be able to refuse a tear of sympathy for the sufferings which bowed down his noble and manly spirit to the grave.

The following lines, from an anonymous poem lately published, form an appropriate conclusion to this brief sketch:—

"Tears stand within the brave man's eyes,
Each softer pulse is stirr'd;
It is the sickness of the heart,
Of hope too long deferr'd.

"He's pining for his native seas,
And for his native shore;
All but his honour he would give
To be at home once more.

"He does not know his children's face;
His wife might pass him by,
He is so alter'd, did they meet,
With an unconscious eye.

* * * *

"Amid the many names that light
Our history's blazon'd line,
I know not one, brave Collingwood,
That touches me like thine."

REASON AND FEELING.

It cannot fail to be frequently remarked, how little the education of the feelings is attended to in comparison with that of the intellect. In connexion with the latter, we are told that we must be able to perform all manner of feats, and at the same time be capable of giving a great many reasons why we do them, and by what means they are accomplished. Our reasoning faculties are to be racked to the utmost, while those agents which are the cause of all the evil on the earth, as well to their possessors as to others, are left to manage themselves, and to take that direction to which by nature they may be disposed. The passions and sentiments ought surely to have another sort of training than what is now allotted to them, in the system which goes by the name of education—the education, it may be called, of a portion of the man, but one which, in neglecting so essential a part, neglects that which, perhaps, best repays the labour bestowed upon it. From the preponderance given to the cultivation of our reasoning powers, we might be led to conclude that reason was a very infallible guide,

that it could by no possibility lead its possessor astray, or immerse him in a sea of doubts, difficulties, or contradictions. Far from us, indeed, be the presumption, that the reason thus bestowed upon us is to be lightly regarded; but seeing that, in common with all things else, this light is imperfect, and shines but dimly, it should not be considered so much superior to the sentient part of our being,—that part which has the prerogative of dispensing pleasure of the highest kind, or pain of the most intense description.

We must remark here, that we use the word reason in its ordinary acceptance, as a something in contrast to feeling; though it appears to us, that thus to separate their powers, and give to one the pre-eminence over the other, as is generally done, is false; for our *higher* sentiments are as much a part of our intelligence, as the faculty which enables us to know that a circle is not a square. We take as if for granted, that no alliance can exist between what is often called the weakness of feeling, and the strength of reason, yet the two in reality compose the human being perhaps in equal portions, and in equal poise are the agents which alike sway the destiny of individuals and nations. We seek in vain to prove ourselves more the recipients of the one than the other; and we commit an error, when we would exalt the one at the other's expense. The object of a true education ought to be, equally to educate the head and heart, that they may help to guide each other, since we have such continual proofs that we possess feelings which, unfortunately, as often lead us wrong as right, and against whose errors, in the former case, reason is by itself unable to contend.

But, it may be asked, why should reason *not* teach us to be just, give us strength to practise what is right, resist and control feeling when that feeling is wrong, and compel implicit obedience to its dictates? "Reason," says a recent writer, "is not a power, it is only a light; its office is not to vanquish, but to enlighten." It would seem as if reason could only show our feelings the way in which they could best be exerted, leaving feeling to wage war with feeling, until the strongest proclaim the victory. We have only to review the past history of the human race, in order to consider whether reason or feeling has governed the world; we have only to look around us, and see which now prevails; we have daily examples of the force of feeling opposed to the light of reason, even where we least expect to find it,—when the philosopher is carried out of sight by a whirlwind of passion, leaving in his place the man of strong feelings. The reasoning faculties, by themselves, have done but little for the happiness of mankind, whose fate, in one sense, seems to depend more upon the expression or form taken by the sentiments and feelings. We have many giants in reason, while yet slaves to sense; and few of those greater beings, whose reason and feelings being equally cared for, and happily in unison, are equally obeyed and revered. By a retrospect of the past, we may judge of what might occur in the future: placing before us the actions of men, during those ages which were distinguished as *ages of reason*, we are compelled to own (judging by the reason now in our possession) that reason, instead of being enthroned in man as a supreme power, had altogether deserted its followers, and abandoned them to madness. We are astounded, as we well may be, at the reason which could not only tolerate, but applaud the enormities, the nameless crimes perpetrated during the reign of the Roman emperors, in the times when a Virgil wrote, and a Seneca taught—and taught morals, too!—during periods perhaps the most resplendent in the intellectual history of Rome. In like comparison, we may advert to modern times, and in a Christian kingdom, where, amidst the horrors of the French Revolution, and its reign of terror, reason fled, as if affrighted at the monstrous audacity of man, and left in its stead the demons of insanity and fury, though man blindly could compliment his fellow man, at the

moment, upon the pitch of wisdom to which they had aspired, and, as they conceived, attained. Yet it was the *feeling* of oppression and disgust at tyranny which occasioned this revolution, and it was *feeling*, become madly impassioned and blind, which deluged the country with the blood of its own children. It was afterwards the *feeling* of ambition which led the same people to trample upon other powers; it was not reason, but *feeling*, which beset their leader with the idea of absolute dominion; and it is *feeling* which makes the nation he so despotically ruled (though with a rod so dazzling, that in appearance it ceased to be a rod) still deify their ambition-mad hero. Finally, when we see insanity, in the majority of its cases, produced by over-excited and ill-governed feeling; when we are so fully aware that love and hatred, pride, envy, ambition, divide with reason the possession of the human heart, and divide the empire of the world, it surely cannot be less than folly, in those who profess to teach the human mind, to turn their almost exclusive attention to the development of its thinking part alone, leaving the other to its own uninstructed and unguided inherent tendencies.

It is difficult to believe that emotions were given us merely to be crushed, or that affections were bestowed upon us merely that they might be frozen. It is true that some feelings ought to be indulged but sparingly, or they promote any thing but the happiness of the possessor, and there are others which in excess the human frame could not long endure: the former are those which centre chiefly in ourselves rather than radiate towards others, and are properly called selfish; while the latter, threatening to rend asunder body and soul, are the rarely felt profound emotions, such as agony of mind, or its joy in excess. While such cases are infrequent, yet hundreds die slowly from wounded sensibility or disappointed hopes, even while reason tells them it is unwise to be thus sorely grieved. It has never yet been found that the men of the most genial feelings have been wanting in intellect; and it seems to us that the reason which is most cultivated must show the greatest respect for that which is generous and noble-hearted. Feeling is assuredly oftener the prompter of reason than the latter is willing to confess; it silently receives energy from the former, yet never acknowledges the obligation, but, on the contrary, loudly asserts that opinions are impartial or worthy of trust, exactly as they are uninfluenced by personal or other feeling. We are often startled by hearing men loud in the assertion of their possession of unadulterated reason, while all the time they scarcely make use of a single argument which has not personal feeling as a large ingredient in its composition—nor can it be otherwise, however much the contrary may be asserted.

To judge from the outward characteristics of the present time, there appears to be arising a craving for the ideal or the spiritual. Even in the midst of this age of practice and utility, it would seem that man cannot, for any length of time, be tied down to the visible only. This spirit evermore claims consideration, and asserts its claims even when its slumber seems to be longest and deepest; the voice of the past unites with that of the unseen future; and man thus proclaims his relationship with the spiritual, as well as with the material world. The visible seeks a something unseen, beyond itself; and though somewhat paradoxical, the invisible seeks to be clothed with the visible: at every progressive stage a portion of the desired unseen becomes a tangible reality, and the realization of one paramount desire becomes the parent of another, which, in like manner, awaits a future embodiment. Our wishes are illimitable, stretching across the boundless ocean of the infinite, and alike infinite must be their fulfilment; for, as Fénelon says, "It is, indeed, true. I do not deceive myself in saying, I carry, though finite, an idea within me, which represents to me a thing infinite."

THE SHEPHERD OF THE GIANT MOUNTAINS.

(Concluded.)

V.

Up from his knees he sprang—
There seemed a sudden dawn of deathless light—
Fresh life and hope exultant nerve his limbs;
And, as he climbs along the rugged way,
He dares to think upon his peerless prize.
"Hideous and spiteful griffin-brood! I see
Your grim looks watching me, I hear your voices
Lift up their shrill and hissing scream. I know ye!
Ye crave my bones to grace your ghastly banquet!
Ha! how ye stare upon me! Hans was right;
Ye would devour us all. Your hour is come.
Ay, roll your fiery eyes in wrath, and whet
Your crooked claws, and rear in rage malign
The bright and bristling crests upon your heads!
I care not!
I love to see ye look so terrible,
Else might it pain me thus with fire to burn
Your living forms! Now to the work of death!"
A branch he kindles on a lofty stem,
And lifts it up with toil to touch the nest.
Ha! how the dry bark catches, flames, and flares!
The oak itself, so often steeped in blood
That its parched leaves no longer greenly flourish,
And its stiff boughs are hollow, dried, and dead—
The oak itself is kindled by the fire—
It hisses, it rustles, it cracks,
And through the tumult of the rising flames
Pierce the shrill howlings of the tortured brood.
Far on her bloody way
The mother-griffin heard,
And measuring a league with every stroke
Of her colossal wings, she rushes upward,
Shadowing the mountain with a fearful darkness.
Then Gottschalk thought, "the dream of life is past!"
And gave his soul into the hands of God.
But, heedless of revenge,
The griffin strikes and strives to quench the flame
With her huge wings; strikes with such eager fury,
That Gottschalk marvelled how so fierce a monster
Should yet preserve her children by the risk
Of her own life. In vain! The grisly brood
Lie scorched and stifled in the pangs of death;
And, lo, the flame hath caught the griffin's wings,
As if in thirst for vengeance!
The reeling monster falls upon the grass.
Now, shepherd, now! Where is thy ready staff?
Now! Lose no moment! For the wrathful beast,
Frantic with rage and pain, hath reared itself
On its broad feet, and stands, half-tottering,
But dreadful still, and eager for the fight:
Then had the hapless youth been crushed to nothing.
But that he lifted up his heart to God,
And that a vision of inspiring beauty
Rose on his soul, and bade him not despair!
Stroke upon stroke he hurls against the foe:
He stabs it in the fiery eye—the beast
Rears in wild rage, then, quick as thought, the staff
Pierces its undefended breast, and sinks,
Sure, deep, and deadly, in the ruthless heart!
It roars as with the congregated voices
Of thousand oxen; reels, and strikes its wings
Once more, with impotent fury, on the earth—
And all is over!
The terror of the land lies stiff in death!

All breathless Gottschalk leans
Upon his conquering staff, and looks around
Upon the scene, now steeped in evening coolness;
Soft airs steal up, as if in gratitude,
Fanning his weary brow, and lifting thence
The wavy curls of his abundant hair;
While his young face, all glowing from the battle,
Smiles forth refreshed, in tranquil joyousness.

VI.

The shepherd stood before the ducal castle,
 And at his side the slaughtered monster lay;
 Laboriously, by strength of linked cords,
 His hands had drawn it from the hill; and now,
 Blushing for shame, he stood and eyed the ground,
 Girt by a ring of gazing lords and knights.
 Scarce dared he think upon the peerless prize,
 So poor he seemed, and worthless, to himself.
 The duke stood deeply musing; first he gazed
 Upon the griffin, then upon the youth,
 And then into the depths of his own heart.
 He waves his hand,—a page departs in haste
 And seeks the palace-hall,
 To summon thence the Lady Adiltrude.
 Then stepped a baron forth, and whispered low
 In the duke's ear:
 "Can this be earnest? Give you to a peasant
 That queen of loveliness?"
 "He slew the griffin;
 The prize is his."
 "Ay, if he were a knight!"
 "My words were spoken to all Christian men."
 "Great duke, how could so wild and strange a dream
 Enter the thought of man?"
 "Nay, it hath entered
 The thought of God."
 "Most noble prince,
 Thou knowest I hoped myself—"
 "Fair sir, your pardon;
 Why was it not thyself that slew the griffin?"
 Now, blushing, trembling, shrinking,
 Forth from her chamber comes fair Adiltrude;
 Silent are all, and shadowed every eye,
 And even the duke's proud heart grew sorrowful;
 Yet he bethought him of his plighted word,
 And raised his head, and looked upon the throng
 With steadfast and indomitable eyes.
 The maiden stepped into the wondering circle,
 Her soft hands folded on her breast, her looks
 Fastened on heaven: so stood she for a moment,
 Then, full of trustful joy and glad submission,
 She took the youth's right hand,
 Bent low before her noble sire, and spake:
 "By this brave arm our hapless land was freed;
 Mine honoured father, bless the shepherd's bride!"

VII.

Lo, with the earliest beams of breaking morn
 Once more young Gottschalk drives his flocks afield!
 What means he? Is he not a mighty lord,
 Ay, a duke's son?
 Or has the prince recalled his plighted word?
 Or is fair Adiltrude unfaithful found?
 Forbid it God! Those true and lofty hearts
 Are changeless in their purity. But thus
 The honourable duke hath mildly said:
 "My son, thou needest castles, lands, and lordships,
 As fitting portion for my gentle child.
 So, when the first faint gleam
 Of rising daylight smiles upon the mountain,
 Take in thy hand thy conquering shepherd-staff,
 And, for the last time, drive thy fleecy herds
 Forth, over field and hill, nor pause to rest
 Till sinks the sun upon thy weary steps;
 The space of earth which in that space of time
 The circle of thy wandering course contains,
 I grant to thee and to thy shepherd-bride."
 It was for Adiltrude! How eagerly
 The agile Gottschalk led his willing flocks!
 How merrily his lambs tripped after him!
 They timed their marching to the mirthful pipe;
 And amid other lays,
 Whose joyous notes beguiled the busy way,
 This gladsome strain the conquering shepherd sang:
 "Land and lordship who winneth to-day,
 That the bride of his love may have meet array?
 The shepherd! the shepherd! 'tis he!"

Look down, thou glittering sun! Give ear,
 Ye brooklets, murmuring deep and clear!
 And ye familiar woods and dear,
 Listen, and marvel, and see!

"What troops are marching in warlike pride
 To conquer castles for that sweet bride!
 Hark to the tinkling bell!
 Look at the lambs, as in sport they glide
 Through the shadowy reeds so twisted and tall—
 Look, and listen, and marvel all,
 Sun, forest, fount, and well!"

And, lo, when sank the dewy eventide,
 Young Gottschalk, with his merry pipe and song,
 Had paced around a piece of land so goodly
 That it was named a county! As he drove
 His flocks again before the ducal castle,
 Smiling the prince beheld him from the casement,
 And thought within himself: "This is God's will,
 And therefore must be good." Far other thoughts
 Sir Baldwin cherished in his haughty heart—
 (This was the knight of whom I spake but now,
 And told ye how he whispered to the duke)—
 He stood before the gate, with smiles of scorn
 Greeting the shepherd: "Good luck, gentle Gottsche!
 Gramercy, Gottsche, but thy sheep are swift!
 Gottsche, thy sheep have won thee wondrous honour!"
 The youth beheld him with his cloudless eyes,
 And spake:
 "Proud lord, to-day I must not answer thee,
 But I shall find an hour for meet reply!"
 And, singing still, he passed into the castle.

VIII.

Now through the painted windows of the chapel
 The consecrated torches pour their light,
 Solemnly beautiful; in cope and alb
 The priest awaits that wondrous bridal pair;
 The hallelujah sounds,
 The stately train begins,—
 Then kneeled the shepherd youth before the duke
 Lowly upon his knee, and spake these words:
 "My prince, thy generous bounty hath endow'd me
 With goodly lands and noble store of wealth
 For grace and nurture of my gentle bride;
 But, ah! the grace and nurture of the soul,
 And knightly skill in martial exercise,
 And many another high and noble gift
 Pertaining to the character of knight,
 Which I so covet—these, as yet, I have not.
 Therefore, I pray you, keep awhile for me
 My matchless pearl in your high guardianship,
 Until I earn the knightly spurs, and all
 Own me a fitting warder for her brightness.
 Not gold itself is deemed a worthy setting
 For a rare gem till it be purified."
 A glad assent the gracious monarch gave,
 And to a grey-haired knight of noble race
 And high renown in arms he led the shepherd,
 To learn the fair profession which he sought.
 Well pleased, the hero hailed the gallant student;
 And, as they left the castle, side by side,
 The lady Adiltrude stretched forth her hand,
 White as a swan's soft breast, and suffered him
 To seal their parting by a single kiss.

IX.

More than twelve moons had slowly waxed and waned,
 And yet no tidings of the shepherd came.
 Far in a lonely castle,
 Girt by mysterious shades
 Of mighty forests stretching far and wild,
 The exiled master and his pupil dwelt.
 When, on a sudden, to the duke's fair palace
 There came a stranger knight:
 His mail was silver bright, his pacing steed
 White as the driven snow. Was this the shepherd?
 To every heart it seemed impossible:
 For with high courtesy and fearless grace,
 Like a young prince, bred from his nurse's arms
 'Mid stately heroes and illustrious dames,

He to the ladies pays his fair devoir ;
 Before his lovely bride
 Full reverently he bows,
 His helmèd forehead crowned with waving plumes.
 Far sweeter now the blushing maiden's smile,
 Than that wherewith she graced the shepherd Gottschalk
 When he stood humbly by his tutor's side.
 In joyful doubt the wondering duke must gaze,
 Until the grey-haired knight stepped proudly forth,
 And spake before them all : " Behold my pupil !
 Three days ago, his trial fully past,
 He took the gift of knighthood from this hand ;
 And now he begs a field, and here defies
 Sir Baldwin to the combat,
 For that he scorned him when he drove his flocks
 Before the castle-gate." The duke consents.
 Proud in his gleaming mail stands stern Sir Baldwin :
 The lists are ordered in the castle-court,
 While in the heaven-blue eyes of Adiltrude
 Glimmers one pearly tear.
 The clarion sounds. With what a stirring clash
 The mail-clad warriors meet in lightning course !
 Each, like a meteor, flashes past the other ;
 Each, like a statue, stirs not in the saddle ;
 Yet upward, with a quick and crackling sound,
 Spring their far-splintered lances. Now they draw
 Their glittering swords, and spur their gallant steeds
 To fierce encounter.
 Wildly and fast Sir Baldwin showers his blows ;
 Blithe-hearted Gottschalk, dexterous, light, and swift,
 Shuns every stroke and parries every thrust,
 Making his snowy steed curvet and dance
 As though in sport, and dallying with his sword
 As if it were a plaything. Baldwin seemed
 The peasant, wearing his first mail, and fighting
 In his first battle. Gottschalk bore himself
 A graceful hero well approved in arms.
 How should this be ? 'Twas that Sir Baldwin felt
 His skill o'ermastered, and grew furious—
 But strong and fearless was the shepherd knight,
 And therefore could he trifle with his danger ;
 At every well-aimed thrust he proudly thought,
 " My bride beholds my prowess ! " Joyfully
 His lady watched him ; from her gentle heart
 Fear, like a cloud, departed ; with a smile
 She looked upon the duke, who proudly gazed
 Round on the circling crowd of knights and lords,
 And seemed to say, " See, nobles, what a bridegroom
 The grace of God hath granted to my child ! "
 Meanwhile Sir Baldwin
 Urges the fight with such unguarded fury,
 That, by a sudden charge, his foe unhorsed him.
 Light from his steed the shepherd leaps upon him,
 Wrests from his grasp the useless brand, and hurls it
 Out of the lists, then gently raises him,
 And speaks : " Sir Baldwin, I have wiped away
 The shame which I, in former time, endured ;
 Therefore I pray you, wear this sword of mine
 As a memorial and a sign of friendship."
 He placed the glittering weapon, all embossed
 With golden crosses and with jewelled hilt,
 In the grasp of his astonished enemy.
 Mutely Sir Baldwin bowed—
 But soon his nobler nature conquered him ;
 He loosed his vizor's clasp, and showed his face,
 Glowing with generous shame, to all the world ;
 Confessed his fault in honourable words,
 And cast his arms about his victor's neck.
 The prince cried, stooping from his balcony,
 In gratulating tones,
 " Come to my heart, my true and gallant son ! "

X.

Now raised the duke the kneeling knight, and spake,
 While o'er his shoulders Lady Adiltrude
 Flung a rich scarf which bore her colours, thus
 Proclaiming him her hero to the world.

" I would, dear son, I had aught else to give thee,
 In sign of my paternal love and grace ;
 But I have given thee all in this sweet child !
 Yet, if thou hidest in thy heart a wish,
 Fear not to speak it freely—it is granted,
 If I have power to grant it." Thus at once
 The youthful knight gave answer to his words :
 " My lord and father, as I crossed the vale,
 I met a grey-haired shepherd, who, of old,
 Was, in my days of humbleness, my friend ;
 To him, when I forsook my hut, I gave
 My fleecy herd, in memory of our love.
 Now joyfully I greeted him : ' Good Hans,
 How farest thou ? ' Familiarly he answered,
 As in times past, ' Right well, beloved Gottsche ;
 Thy sheep, too, have not suffered any harm.'
 Thereat I mused right deeply in my mind ;
 And now methinks
 That lowly name, and those mine innocent sheep,
 Must be my crown of honour, not my shame.
 Therefore I pray you, for all future times
 Let these my rich possessions bear this name,
 This honourable name, ' The shepherd's kingdom ! '
 Did not King David, he, a man of God,
 A king, in all his pomp and pageantry,
 Love to bethink him of his shepherd-youth ?
 And why not I, a poor and humble knight ?
 And certain am I, such humility
 Seems dear and gracious to my gentle bride—
 Speak, Adiltrude ! " In modest tenderness,
 For the first time, she proffered him her lips,
 Soft as a bursting rosebud. Joyfully
 The duke beheld, and thus, consenting, spake :
 " My son, thy words are right. By God's good will,
 On the firm base of this humility
 Thy house shall stand for many a century."

The aged prince's prophecy was true :
 Firm stands the house of Gottschalk at this day ;
 And from his wondrous race in honour grew
 Full many an hero and full many a lay.
 But other bards their fame in song may tell ;
 For me, my lute is sounding its farewell.
 Blithe-hearted German heroes ! ever be
 True to your God, in brave humility.

S. M.

THE ROUND TOWERS OF IRELAND.

No. I.

IN most civilized countries there exist a number of architectural remains, possessing more or less interest, as their origin can be traced to a period more or less remote, or as they may be illustrative of the history of such countries, ecclesiastical or civil.

Where the date of these structures remains altogether dubious, and the uses to which they were applied little more than a matter of conjecture, the subject becomes a fruitful source of inquiry and of controversy among learned men. Witness the discussions on the supposed druidical remains of England, on the vitrified forts of Scotland, and on the round towers of Ireland. The history of the last-named edifices has latterly received a full and able investigation, the results of which are presented to the public, in Mr. Petrie's elaborate " Inquiry into the Origin and Uses of the Round Towers of Ireland." ¹ From the less abstruse portions of this valuable work, we may glean something that will be

(1) The ecclesiastical architecture of Ireland, anterior to the Anglo-Norman invasion, comprising an " Essay on the Origin and Uses of the Round Towers of Ireland," which obtained the gold medal and prize of the Royal Irish Academy. By GEORGE PETRIE, T.H.A., V.P.R.I.A. Second Edition. Dublin: Hodges and Smith, Grafton Street. 1845.

GREATER ROUND TOWER OF CLONMENOISE.

interesting to our readers, when taken in connexion with commonly known facts.

The round towers of Ireland formerly existed in considerable numbers throughout that island. At present, they are only about eighty-three in number, and of these little more than twenty remain entire. These edifices are all of the same peculiar and striking form, and, with the exception of two similar towers in Scotland, there are no buildings like them in any part of Christian Europe. They are round cylindrical edifices, usually tapering upwards, and varying in height from fifty to, perhaps, one hundred and fifty feet. Their external circumference at the base, is from forty to sixty feet, or upwards. The masonry of these towers is of that description called "spawled rubble," in which small stones, shaped by the hammer, are placed in every interstice of the larger stones, so that very little mortar appears to be intermixed in the body of the wall; and the outside, therefore, presents an almost uninterrupted surface of stone. In some instances, however, the towers present a surface of ashlar masonry, both on the outside and inside, though more usually on the exterior only. The wall towards the base is never less than three feet in thickness, but is usually more, and occasionally five feet, being always in accordance with the general proportions of the building. The interior of the edifice is divided into stories, varying from four to eight, as the height of the tower permits, and usually twelve feet high. These stories are marked, either by projecting belts of stone, set-offs, or ledges, or holes in the wall to receive joists, on which rested the floors, which were almost always of wood. In the uppermost story, the wall is pierced by two, four, five, six, or eight openings, but most usually four, which sometimes face the cardinal points, and sometimes not. The lowest story, or rather its place, is sometimes composed of solid masonry; and even when not so, it has never any opening, the entrance doorway being in the second floor, at

a height of from eight to thirty feet from the ground. The middle stories are each lighted by a single opening, placed variously, and usually of very small size, though, in several instances, that immediately over the doorway is nearly as large as the doorway itself, and would almost appear to have been a second entrance. The building is finished at the top with a conical roof of stone.

In the architectural features of these towers, considerable diversity is observable. When the tower is of rubble masonry, the doorways seldom present any decorations, and are either quadrangular, and covered with a lintel, of a single stone of great size, or semicircular headed, either by the construction of a regular arch, or the cutting of a single stone. But, in the towers of Kildare and Trinahoe, we have instances of very richly decorated doorways, although the buildings are of rubble masonry. In the more regularly constructed towers, the doorways are always arched semicircularly, and are usually ornamented with architraves, or bands, on their external faces. The upper apertures are generally of a quadrangular form, and without ornament. They are, however, sometimes semicircular headed, and still oftener present the triangular or straight-sided arch.

Such are the celebrated round towers of Ireland, which for ages have formed a subject of doubt and difficulty with antiquarians, and which have been thus well characterised by a writer in the Quarterly Review:—"Tall, slender, cylindrical, cone-topped piles, too small for habitations, too simple for ornament, too vast for mere appendages to the little buildings with which they seem to have been connected, too uniform in structure to be accidental caprices of taste, and yet too varied to be all reduced under one age, rising up, as they often do, among the bleakest mountains, by a gloomy lake, or on some desolate island, or even from a group of ruins clustered round them by ages later than their own, as on the rock of Cashel, they produce a singular effect of

mysterious, ghost-like grandeur, far beyond any composition of the most elaborate architecture."

No wonder that edifices such as these should have given rise to strange and varied theories as to their origin and use; no wonder that the native Irish often view them with superstitious awe, and attribute their erection to their mythic hero, *Goban Saer*, whose building exploits, according to their tradition, became renowned in distant lands; and no wonder, also, that even the laborious researches and careful conclusions of Mr. Petrie are insufficient universally to remove the idea of very remote antiquity, as attaching to these towers. Let us now briefly view the separate theories respecting the round towers, including the last and most important as propounded by the above-named author.

First, as to their origin. This has been ascribed to the Danes, but the only ground for this ascription appears to have been the simple observation of the celebrated John Lynch, author of *Cambrensis Eversus*, that "the Danes, who entered Ireland, according to Giraldus, in 838, are reported to be the first builders of these towers." This timid surmise was strangely assumed as a certainty by later historians, one of whom (Peter Walsh,) writes thus:—"It is most certain that those high, round, narrow towers of stone, built cylinder-wise, whereof *Cambrensis* speaks, were never known or built in Ireland (as, indeed, no more were any castles, houses, or even churches, of stone, at least in the north of Ireland) before the year of Christ 838, when the heathen Danes, possessing a great part of that country, built them in several places, to serve themselves as watch-towers against the natives. Though, ere long, the Danes being expelled, the Christian Irish turned them to another and much better (because a holy) use, that is, to steeple-houses, and belfries to hang bells in for calling the people to church. From which latter use made of them it is, that ever since, to this present time, they are called in Irish *clotheachs*, that is, belfries or bell-houses; *cloc* or *clog* signifying a bell, and *teach* a house, in that language."

This opinion of the origin of the round towers is contradicted (according to Mr. Petrie) by the whole tenor of the Irish annals; from which it may be seen that the Danes, a rude and plundering people, were so far from being the builders of ecclesiastical edifices, except in a few of their own maritime towns of Ireland, that, almost invariably, during their settlement in the country, they were the remorseless destroyers of them. It might be conceded, that, on their conversion to Christianity, they may have founded a round-tower belfry in Cork, or any other town inhabited by them; but of this there is no proof, while probability is much against the supposition.

A second theory as to the origin of the round towers ascribes them to the Phœnicians, Persians, or Indo-Scythians; but this theory appears to be altogether romantic and groundless. According to the differing opinions of those who support it, the towers were employed as fire-temples, or they were used as places from which to proclaim the Druidical festivals, or they were gnomons, or astronomical observatories, or they were Phallic emblems, or Buddhist temples. By one author it is stated, that there can be no doubt of the round towers of Ireland having been fire-towers. The construction, he says, was well adapted for the purpose; the door being always from twelve to fifteen feet from the base, the sacred fire could not be molested by the wind; it was covered by a cupola at top; and four small windows in the sides, near the top, let out the smoke. The diameter was no more than sufficient for the priest to perform his sacred office; his prayers were not to be heard by the congregation, as in the service his mouth was covered, lest he should breathe on the holy fire, so that he mumbled or muttered his words: when he had done, he probably ascended to the door or to the top, and gave his benediction. The sacred fire was fed by the wood of a sacred tree, i. e. the oak. The same writer goes on to state, that, from history it is evident, that, as in ancient

Persia, so in ancient Ireland, there were two sects of fire-worshippers, one that lighted the fires on the tops of mountains and hills, and others in towers; an innovation said to be brought about by Mogh Nuadhat, or the Magus of the new law.

All this sounds very plausible, until we learn from Mr. Petrie that Irish history furnishes no such facts as are here stated. It mentions that fires were lighted by the Druids on the tops of mountains and hills; but there is not one word to be found in that history respecting fires having been lighted in towers, nor about the innovation said to have been brought about by Mogh Nuadhat.

The similarity of form between the Persian and Hindoo fire-temples, and the Irish round towers, has been, no doubt, the reason of the prevalence of this opinion respecting their original use. Hanway, in his *Travels in Persia*, describes four remaining temples of the fire-worshippers, as being "round, and above thirty feet diameter, raised in height to a point near one hundred and twenty feet." These must certainly have borne a strong resemblance to our round towers, but they were nearly three times their average diameter. There are towers also in the interior of Hindostan, which greatly resemble the Irish towers, and Mr. Petrie confesses himself far from wishing to deny the remarkable conformity between many edifices, whether Christian or Mahometan, and our round towers: his aim is to establish, from that very conformity, sufficient grounds for belief that they are all derived from the same source, namely, the early Christians.

Before we dismiss this part of the subject, it is but fair to state, that the supposed pagan origin of these temples has been advocated by high authorities, and that Moore, the great national poet of Ireland, has lent his talents to sustain the hypothesis, as will be seen by the following passage:—

"As the worship of fire is known, unquestionably, to have formed a part of the ancient religion of the country, the notion that these towers were originally fire-temples appears the most probable of any that have yet been suggested. * * * To this day, as modern writers concerning the Parsees inform us, the part of the temple called 'the place of fire' is accessible only to the priests; and, on the supposition that our towers were, in like manner, temples, in which the sacred flame was kept safe from pollution, the singular circumstance of the entrance to them being rendered so difficult by its great height from the ground is satisfactorily explained. But there is a far more striking corroboration of this view of the origin of the round towers. While in no part of continental Europe has any building of a similar construction been discovered, there have been found, near Bhangulpore, in Hindostan, two towers, which bear an exact resemblance to those of Ireland. In all the peculiarities of their shape—the door or entrance elevated some feet above the ground, the four windows near the top, facing the cardinal points, and the small rounded roof,—these Indian temples are, to judge by the description of them, exactly similar to the round towers: and like them, also, are thought to have belonged to a form of worship now extinct, and even forgotten." After noticing other theories, this able writer thus gives his judgment as to the attempt to claim them as Christian edifices:—"An ingenious writer, in one of the most learnedly argued, but least tenable, of all the hypotheses on the subject, contends that they were erected by the primitive Coenobites and bishops, with the aid of the newly converted kings and toparchs, and were intended as strongholds, in time of war and danger, for the sacred utensils, relics, and books, belonging to those churches in whose immediate neighbourhood they stood. To be able to invest even with plausibility so inconsistent a notion, as that, in times when the churches themselves were framed rudely of wood, there could be found either the ambition or the skill to supply them with adjuncts of such elaborate workmanship,

is, in itself, no ordinary feat of ingenuity. But the truth is, that neither then, nor at any other assignable period within the whole range of Irish history, is such a state of things known, authentically, to have existed, as can solve the difficulty of these towers, or account satisfactorily, at once, for the object of the buildings, and the advanced civilization of the architects who erected them. They must, therefore, be referred to times beyond the reach of historical record. That they were destined originally to religious purposes can hardly admit of a question; nor can those who have satisfied themselves from the strong evidence that is found in the writings of antiquity, that there existed between Ireland and some parts of the East an early and intimate intercourse, harbour much doubt as to the real birth-place of the now unknown worship, of which these towers remain the solid and enduring monuments."—*Moore's History of Ireland.*

In the year 1841 diligent search was made in the round towers of Ireland, to discover whether they might not, among other uses, have been employed as burial-places by their supposed pagan architects; and, in fact, sepulchral remains were found in several of them. In the base of the tower of Ardmore, the remains of two skeletons were found deposited in a bed of sifted earth. Above this was a floor of concrete, over which were four layers of large stones, closely fitted to each other, and over these another floor of concrete. Three skeletons were also found in the base of Cloyne Tower. Human remains have also been discovered in the towers of Ram Island, Roscoe, and Dromboe. An urn was likewise discovered in the tower of Timahoe; and fragments of others were found in the towers of Abernethy and Brechin, in Scotland. These discoveries are robbed of some of their apparent importance, when we consider that skeletons are often found in similar situations when there is occasion to dig to a greater depth than common; and that it is quite possible the towers may have been erected on the site of ancient cemeteries. Respecting the urns, if proved to be really pagan relics, the evidence would be much more satisfactory; but Mr. Black, under whose direction the round tower of Brechin was excavated, has so little faith in the matter, that he thinks the articles found had been tossed in at what, in Scotland, is called the Reformation; and that the fragments of urns and jars were just the remains of culinary vessels belonging to the different kirk officers.

Mr. Petrie, also, is by no means satisfied with these alleged discoveries; and is of opinion that, if we wish to ascertain whether our pagan ancestors erected the round towers as sepulchral monuments or not, we should determine the question, not by the short process of digging in the bases of towers, but by the more laborious examination of the ancient literature of the country, which is still abundant in amount, and rich in information, on the usages of early times. He then proves, from one of the most celebrated Irish manuscripts, that the Irish, in pagan times, had regal cemeteries in various parts of the island, appropriated to the interment of the princes of the different races; and that such cemeteries were well known to the people in Christian times, though no longer appropriated to their original purpose, except in one or two instances, where the localities were consecrated to the service of Christianity. The document in question refers distinctly to the principal burying-places; and in these there is not, at the present day, a vestige of a round tower. In another article we shall follow Mr. Petrie in his theory of the Christian origin and uses of the Round Towers.

THE LAST WORD OF THE SINGER.

CHAPTER III.

WHEN the signora had concluded, the doctor affectionately took her hand.

"I congratulate myself," he said, "that I am one among the few persons you have met with in your career. It is certainly not in my power to do for you what her Eccellenza did, but I shall endeavour to aid in unravelling the mystery which hangs over your singular history. I shall go to your friend, that fiery fellow, and try to soothe him. But tell me, whence comes this Signor Boloni?"

"You ask me too much," she replied. "I only know that, on account of family matters, he was obliged to leave his country several years since. He has been residing in England and in Italy, and has now been here nearly a year."

"So, so. But why did you never tell him what you have just related to me?"

Giuseppa blushed at this question, cast down her eyes, and said—

"You are my physician, my fatherly friend; when I speak to you, I feel like a child who speaks to her parent. But how could I relate such things to the young man? Besides, I know his terrible jealousy, his easily aroused suspicion; and I never could muster sufficient courage to tell him from what snares I had escaped."

"I honour, I admire your principles," said Doctor Lange; "you are a good girl, and it does an old man's heart good to meet with these proper feelings of the good old time; for, alas! now it is too often considered a proof of 'bon ton' to throw all such away. But still you have not told me all: the evening at the masquerade—that dreadful night!"

"It is true, I must continue my story. I had often thought, when reflecting on my deliverance, how fortunate it was that the people in that house were under the impression that I had thrown myself into the river; for it was only too certain that if that vile man had had the most remote idea that I was still in existence, he would have found out and dragged his victim back, or else have destroyed her. For this reason, as long as I was in Piacenza, I declined many good offers of engagements at the theatre, as I dreaded being seen in public. However, after I had been there some time, the Lady Scraphina one morning brought me a Paris newspaper, in which was announced the death of the Chevalier de Planto."

"Chevalier de Planto!" interrupted the doctor: "was this the name of the man who took you out of your stepfather's house?"

"Yes, that was his name."

"I was now quite relieved from my fears, and happy at the thought that there was no longer any barrier to my becoming independent, and ceasing to be a burthen to my benefactress."

"A few weeks after this, I came to B—, and the evening before last I went to the masquerade in excellent spirits. Boloni did not know in what costume I meant to appear; I wished to tease him a little, and then to surprise him. As I was going through the room, in a moment a voice whispered in my ear—

"'Schepper! how is your uncle?'"

"I was struck as if by a thunderbolt. I had never heard this name since I had been taken away by that fearful man. I had, indeed, no uncle; and only one person had lived who gave himself out to the world as such—the Chevalier de Planto. I had scarcely sufficient presence of mind to answer—

"'You are mistaken, Mask!'"

"I wished to hasten away and hide myself in the crowd; but the mask pushed his arm in mine, and held me fast."

"'Schepper!,' said the unknown, 'I advise you to come with me quietly, else I shall tell the people here in what company you formerly were.'"

"I was stunned; one feeling only had possession of my mind—the fear and dread of shame. Darkness came over my soul. What could a poor helpless girl do? Should this man, no matter who he were, spread such reports, the world would believe him; and Carlo—ah! Carlo might not have been the last one who would have condemned me. Unwillingly I accompanied the mask. He whispered the most dreadful things to me. 'My uncle,' as he called the chevalier, 'I had made miserable, and brought ruin on my stepfather and his family.'"

"I could endure this no longer: I tore myself from him, and ordered my carriage. As I looked round while standing on the steps, the fearful form was behind me.

" 'I will accompany you home, Schepperl,' he said, with a fearful laugh; 'I have a few words to say to you.'"

"My senses forsook me; I felt myself fainting, and only recovered in the carriage, where I saw the mask seated beside me. I alighted when we reached this house, and went to my room; he followed, and immediately began again to speak to me. In an agony lest I should be betrayed, I sent Babette out of the way.

" 'What do you want here, wretched man?' I exclaimed in anger at seeing myself thus insulted. 'What evil can you say of me? Without my consent I was taken to that horrid place, and left it when I saw what awaited me.'"

" 'Schepperl! do not be ceremonious; there are only two ways of saving yourself: either pay down to me instantly ten thousand francs in gold or jewels, or go back with me to Paris; else, rest assured that to-morrow the whole town shall know more of you than will be agreeable to you.'"

"I was beside myself. 'Who gives you a right to make such proposals?' I exclaimed. 'Tell the whole town what you please, but leave this house instantly, or I shall call in the neighbours.'"

"I had advanced some steps towards the window; when he rushed after me, and seized me by the arm.

" 'Who gives me the right? your father, little dove—your father!'

"A diabolical laugh burst from his lips; the light of the taper fell on a pair of grey piercing eyes, which were only too well known to me. It was evident who stood before me: I now knew that the announcement of his death had been a deception devised by him, to serve his own ends. Despair gave me supernatural strength: I wrenched myself from his grasp, and endeavoured to pull off his mask.

" 'I know you, Chevalier de Planto,' I exclaimed; 'and you shall give an account in a court of justice for your conduct.'"

" 'We are not yet come to that, sweet dove,' he cried; and at the same moment I felt his dagger in my breast. I then thought I was killed."

The doctor shuddered: it was bright day, yet he felt that sort of shivering which people are apt to experience when in the dim twilight they listen to stories of apparitions. He imagined he heard the hoarse laugh of this fiend; he fancied he saw glancing from behind the curtains of the bed the grey twinkling eyes of this monster in human form.

"You think then," he said, after a pause, "that the chevalier is not dead, and that it was he who attempted to murder you?"

"His voice, his eyes, convince me of it; and the handkerchief which I gave you last night leaves no room for doubt. His initials are marked on it."

"You empower me, then, to act for you? May I disclose all you have related to me in the court of justice?"

"I have no choice: you may repeat all. But are you not going to Boloni, doctor, to tell him what I have said? He will believe you; he was also acquainted with the Lady Seraphina."

"And may I not be told the name of the ambassador," continued the doctor, "in whose house you were concealed?"

"Certainly: he was called Baron Martinow."

"How!" cried the physician joyfully, "Baron Martinow? Is he not in the service of S—?"

"Yes; do you know him? He was ambassador from the — Court, in Paris, and afterwards in St. Petersburg."

"That is good, very good," said the *medicinalrath*, rubbing his hands with pleasure. "I know Baron Martinow; he arrived here yesterday, and has sent for me to come and see him: he is at the Hôtel de Portugal."

A tear glistened in the eye of the singer; she clasped her hands, and seemed to be overcome by a feeling of pious gratitude.

"Thus has God in his mercy willed that a person should come here to attest my innocence, whom I had believed to be hundreds of miles distant! Go to him. Ah! Carlo also may listen to him, when he confirms to you the truth of what I have said."

"He shall, he shall go to him; I will set about it directly. Farewell, my dear child: and keep yourself perfectly quiet: all will yet be well with you. Be sure you take the mixture every hour." So said the good doctor, and went away.

Bianetti thanked him by her grateful looks. She became more cheerful and tranquil. It seemed as if by the disclosure of her secret a heavy weight had been removed from her heart. She looked with more confidence towards the future, as a gracious Providence appeared to have compassion on the poor girl.

Baron Martinow, to whom Lange at a former period had had it in his power to render an important service, received him with much kindness, and gave him the fullest satisfaction with regard to the Signora Bianetti. He not only corroborated every word she had said, but added the highest commendation of her character, and promised that, wherever he went in the city, he would make a point of speaking in her favour, and of contradicting the reports which were abroad. He kept his word so well, that, by uttering his opinions, showing the interest he took in her, and writing to her friends, the sentiments of the public underwent a wondrous change, as if touched by an enchanter's wand.

When the *medicinalrath* Lange left the elegant apartment of the ambassador, he ascended the stairs which led to the smaller rooms on the highest floor. In chamber 54 was lodged the music director, Boloni. He stood to recover his breath, for the steep steps had fatigued him. Strange sounds reached his ear; there seemed to be a person within in great distress: he heard groans and sighs, apparently proceeding from one in anguish. Intermingled with the moaning of pain were horrible oaths, uttered in French and in Italian, in which impatience appeared to find vent, while a wild laugh of despair was again succeeded by the deep groans which had first arrested the attention of the doctor. Lange shuddered.

"Have I not already seen symptoms of insanity in the *maestro*?" thought he; "has he now become quite delirious, or has he become ill through grief?"

He had bent his finger to knock, when for the first time he observed that the number of the door was 53. How had he been so stupid? he had almost entered the room of a perfect stranger. Annoyed at himself, he went on to the next door, which was 54. Here likewise there were sounds heard; but how different! A rich deep manly voice was singing, and accompanying his song with the piano. The doctor entered, and recognised the young man whom he had seen the day before at the signora's.

In the apartment lay music paper, guitars, violins, flutes, all kinds of stringed instruments, in admirable confusion; in the midst of which stood the musician, in a wide black dressing-gown, with a scarlet cap on his head, and a sheet of music in his hand. The doctor

afterwards confessed that he brought to his mind Marius amidst the ruins of Carthage.

The young man seemed not to have forgotten the scene of the previous day, and received the doctor but coldly. However, he was polite enough to toss a pile of music from a chair on to the floor, that he might offer his visitor a seat. He himself with great strides paced up and down the room, while his flowing robe swept most diligently the dust from the tables and books.

The doctor had not long to wait before conversation began. The professor cried out to him:

"You come from her! At your age, are you not ashamed to be the messenger of such a woman? I will hear no more. I have buried my happiness in the grave. You see I mourn for my loss. I wear a black dressing gown, which, if you dive deep into psychology, should be a proof to you that I regard that person as dead to me. O Giuseppa! Giuseppa!"

"Most worthy sir," interrupted the doctor, "only hear me."

"Hear you! what know you of hearing? Listen, if you would speak of hearing! I will prove, old man, whether you really have any ear. Behold, this is woman," he continued, opening a piano, and striking a few chords, which to the doctor, who was no great judge of music, seemed much like other music: "do you hear this tenderness, this softness, this pliancy? but do you not also perceive, in these transitions, the unstable, fleeting, characterless nature of these creatures? But hear farther," he exclaimed, with a more elevated voice and sparkling eye, while he shook back the wide sleeve of his mourning robe; "where man works there is power and truth: here can be nothing imperfect; it is a pure, a heavenly sound." He hammered with great force on the keys of his piano, but to the doctor it still seemed like common music.

"You have a peculiar way of characterizing people," said Dr. Lange: "since you have done so much, might I beg of you, honoured sir, to represent to me a *medicinalrath* upon the piano?"

The musical enthusiast looked scornfully at him. "How can you, with your one squeaking note, earthworm, interrupt such harmony?"

The reply of the doctor was cut short by a knocking at the door; a little deformed figure entered, made a bow, and said—"The gentleman in No. 53 civilly begs that you will not make such a dreadful noise with your playing, as he is in a bad state of health, indeed almost dying, and the partition between your rooms is very thin."

"Make my most respectful compliments to the gentleman," answered Boloni, "and as far as I am concerned, I care not how soon he takes his departure from this house. He disturbs me all night long with his moaning and groaning, and what is far more hateful, with his godless swearing and mad laughter. Does the Frenchman imagine that he alone is master in the Hôtel de Portugal? If I disturb him, so does he me, and in a far worse manner."

"But consider, sir," said the little figure, "he cannot hold out long; will you not permit his last moments—"

"Is the gentleman so very ill?" asked Doctor Lange, sympathizingly. "Who attends him? What is the matter with him? Who is he?"

"Who he is I don't know," replied the dwarf; "I am only his hired *valet de place*. I think he is called Lorier, and comes from France. Until the day before yesterday he was well enough, though somewhat dull, for he never went out, and had no desire to see the wonders of this city; but yesterday morning I found him ill in bed. It seems as if the night before he must have had a fit of apoplexy. But he will not hear of any doctor being sent for. He swears dreadfully when I propose to go for one. He applies remedies himself. I think some old wound which he had received in the war must have broken out."

At this moment the sick man began to call out in a

hoarse voice, with many oaths. The lacquy crossed himself repeatedly, and went away.

The physician once more endeavoured to make an impression on the obdurate lover; and this time he appeared to succeed rather better. Boloni had taken up a sheet of music, which he sang over to himself in a low voice. The doctor took advantage of this calm mood, and began to relate to him the story of the signora. At first the *maestro* did not seem to pay any heed to it: he busied himself diligently with his piece of music, as if no one were in the apartment but himself; gradually, however, he became more attentive—he ceased to sing—now and then raised his eyes from the paper and glanced at the doctor; finally, he dropped his sheet of music, and fixed his anxious gaze stedfastly on the face of the speaker: his interest increased; his eyes sparkled; he came nearer, grasped the arm of the doctor; and, as the other concluded, he rose up in great emotion, and hurried up and down the room.

"Yes," cried he, "there may be truth in this, an appearance of truth, a probability; it is possible; it may have been so, but—but may it not also be a falsehood?"

"That is what in your art is called 'decrecendo,' I believe, sir director; but wherefore in this matter descend so low as from truth to falsehood? If I were to bring an indisputable proof, a witness of the truth, what would you then say to me?"

Boloni remained standing before him as if lost in thought. "Whoever, Medicinalrath, could be such a witness, I would set in gold; the very thought deserves a princely, a regal reward. Yes, whoever could assure me—Yet, all is so dark, such a labyrinth—no way out, no leading star."

"Honoured friend," interrupted the doctor, "I rather think you have stumbled on a scrap from Schiller's *Robbers*, as it stands in Cotta's pocket edition, if I remember aright. Yet I know such a surety, such a witness, such a guiding star."

"Whoever shall thus assure me," cried the former, "shall be esteemed my friend, my guardian angel."

"It is true that, in the passage quoted, the reference is to a sword which, with a deep wound, shall destroy the brood of vipers; but for all that, I shall be able to convince you. The ambassador who received poor Giuseppa into his house, now, by accident, lodges in this hotel, in No. 6. Be so good as put on a coat, and tie on a cravat; then I will conduct you to him. He has promised me to convince you."

The young man, much affected, pressed the hand of the kind doctor. Still he could not altogether lay aside his pathos. "You are my good angel," said he: "what thanks do I not owe you for this! I fly instantly for my coat, and will follow you immediately to the ambassador."

Giuseppa's health appeared to derive greater benefit from the reconciliation with her lover, than from the most skilfully prepared mixtures of the physician. Her health visibly improved, and she was soon so much restored, that she was able to sit up and receive the visits of her kind friends. This improvement in her health was waited for by the inspector of police, before he proceeded to take further steps in the matter. He was a very sagacious man, who had all his wits about him; and report said that when he had once cast his eyes on any one, they would not easily escape, although a hundred miles and more away. The history of the signora had been communicated to him by the physician; he had then a consultation with the ambassador, and gained information which was of great importance. The ambassador had told him, that, in consequence of the affair of the young Bianetti, he had taken an opportunity of making known to the proper authorities, the vicious life led by the Chevalier de Planto. He did not fail to place in its true light the fact that this poor child had been actually bought. The notorious house was soon after this seized by the police, and the

baron seemed to think that this was chiefly in consequence of the active part he had taken in the matter. He had heard of the death of the Chevalier de Planto, but believed, with the director of police, that this was a mere trick, in order to continue his trade with greater safety; neither of them had any doubt but that the attempt to murder the singer originated with that vile man. But it was difficult to trace the murderer; the strangers who were then residing at B— were all, as the director assured him, beyond suspicion. There were only two things that might lead to some clue: the handkerchief which had been found in the apartment of the Signora Biancetti might, if another could be found like it, lead to a discovery; an exact description had been given of it to all the seamstresses and the washerwomen who were in the habit of washing for the strangers who visited B—. The inspector likewise suspected that a second attempt would be made on the life of the Italian girl, if the murderer were still lingering in the neighbourhood.

As soon as Giuseppa had gained sufficient strength, the inspector of police often visited her in company with Dr. Lange, when various measures for obtaining their object were discussed. Some plans appeared good, but difficult to put in execution; while others were altogether rejected. Giuseppa herself at length thought of a way which was highly approved of by the two gentlemen. "The doctor," she said, "has promised to permit me to go out in a few weeks; if he has no objection I should like to appear again amongst the people at the last masquerade of the carnival. I feel desirous of first appearing there where my misfortune began. If we make this intention sufficiently public in B— beforehand, and if the chevalier is still here, in all probability he will again come masked into my presence. He will certainly be on his guard against speaking; he will take care not to betray himself; but he will not give up his design of revenging himself on me, and I could recognise him amidst thousands. What do you think, gentlemen?"

"The plan is not a bad one," said the inspector. "When he hears you are to be at this ball, he will not, I am certain, stay away, were it only to see again the object of his vengeance, and to add fresh fuel to his wrath. I think, however, you should not wear a mask: he will then know you the more easily, approach you the sooner, and fall into the snare. I shall dress a few stout fellows in dominoes, and give them to you as an escort: at a sign from you they will lay hold of him."

Babette the waiting maid had gone out and in during this conversation: she had heard the resolution expressed by her mistress of finding out the murderer or his assistant; she considered herself, therefore, bound in every way to aid in his detection. She went to the police inspector, took courage, and said, "She had made the doctor aware of a circumstance which might lead to discovery, but that he did not seem to be of her opinion."

"No circumstance is unimportant, young woman, in such an affair as this," answered the officer of the law, "if you know anything."

"I think the signora is almost too reserved, and that she does not speak out plainly; when she received the stab, and fell fainting into my arms, her last word was, Bolnau."

"What!" exclaimed the inspector, angrily; "and this has been hidden from me till now! Such an important circumstance! Are you certain you heard correctly?"

"Upon my honour," replied the damsel, laying her hand solemnly on her heart, "the signora said 'Bolnau,' and said it so sadly, that I never doubted it was the murderer's name; but I beg of you not to betray me!"

It was a maxim of the inspector's that no man, however respectable he might appear, was altogether beyond suspicion. The counsellor of the board of trade, Bolnau

(and he knew no other in the city of that name), was, indeed, known to him as a most orderly person; but were there not cases where persons, against whom nothing could be said according to public appearance, were precisely those who gave the officers of justice most trouble? Might Bolnau not be acting secretly in concert with this Chevalier de Planto? Pursuing such reflections, he took his way towards the broad street, as it occurred to him that the counsellor was in the habit of walking there about that hour, and he was determined to sound him a little. Just at that moment Bolnau came down the street, and, as usual, was saluting and speaking to his acquaintances on all sides; he was laughing, and appeared to be in excellent spirits. He was within about fifty steps of the inspector, when he caught the first glimpse of this functionary: he became pale, turned round, and was in the act of slipping down a side street. "A suspicious, a most suspicious circumstance," thought the inspector, as he ran after him, and called him by his name, which made Bolnau stand still. The counsellor seemed the image of woe; in hollow tones he uttered a *bon jour*, tried to smile, but his features became convulsed, his knees shook, and his teeth chattered.

"It is a rare thing to meet you now, sir," began the inspector. "I have not seen you pass my house for some time. You do not appear to be quite well," added his tormentor, with a piercing look. "You are very pale. Is there any thing the matter with you?"

"No, I am only rather cold; I was certainly not very well for a few days, but, Heaven be thanked, I am now better."

"So you have not been well," continued the inspector; "I should not have thought it, for I fancied that I saw you at the masquerade lately, when you appeared quite cheerful and well."

"Yes, so I was; but the next day I was obliged to keep my bed—one of my old nervous attacks; but I am now perfectly recovered."

"Well, then, I hope you will not fail to be at the next assembly; it is the last of the carnival, and will be most brilliant. I shall expect to see you there. Till then, adieu, counsellor."

"He expects to meet me there!" exclaimed the counsellor, with a rueful countenance. "He suspects me," thought he to himself. "He must know something of the last word uttered by the singer. It is true she is recovering; but may not the suspicion which exists in the mind of this officer of the police become noised abroad? May he not order me to be watched? The secret police will then follow me; whenever I turn, I shall see strange cunning faces! I shall not dare to speak, for each word will be reported, interpreted: I shall be regarded, alas! as a turbulent fellow, a dangerous individual; and yet I have lived as quietly and harmlessly as William Tell in the fourth act."

In this way soliloquized the unfortunate Bolnau. His agony increased, as he thought of the insidious questions about the masquerade; "he certainly thinks I shall not venture near the signora, on account of an evil conscience; but I shall; I must, if only to remove his suspicion. And yet—may I not feel a shivering, a trembling come over me in her presence, just because I know he will be thinking that I must tremble from the stings and torture of an evil conscience?"

He tormented himself with such thoughts; they haunted him the whole day. He remembered that an author had shown, in a celebrated work, how people might have anguish from dread of anguish; and this appeared quite to be his case. But he felt that he must be courageous, and face the danger. He borrowed for the occasion, from the mask-lender, the magnificent costume of the Pacha of Janina: he put it on every day, and exercised himself in front of a large mirror, in order to exhibit in his mask without restraint. He made a figure of his dressing-gown, placed it on a chair, which figure was to represent Signora Biancetti. He

walked about as the Pacha, then approached her, and congratulated her on her restored health.

On the third day he was enabled to play his part without shaking; he therefore thought he might do a little more, and undertake something yet more difficult. He wished to appear quite at his ease, and very polite; and he resolved on offering her pure refreshments. He practised with a glass of water on a plate: at first it rattled sadly in his trembling hand; but he at last overcame this weakness, and was even able to act his part quite easily, so that no mortal would be able to say that they saw him tremble. Ali Pacha, of Janina, now felt himself sufficiently courageous to go to the masquerade, in spite of his anxieties.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE ANCIENT MANSION.¹

To part is painful; nay, to bid adieu
Even to a favourite spot, is painful too.
That fine old seat, with all those oaks around,
Oft have I view'd with reverence so profound,
As something sacred dwelt in that delicious ground.

There, with its tenantry about, reside
A genuine English race, the country's pride;
And now a lady, last of all that race,
Is the departing spirit of the place.
Hers is the last of all that noble blood,
That flow'd through generations brave and good;
And if there dwells a native pride in her,
It is the pride of name and character.

True, she will speak, in her abundant zeal,
Of staidness honour; that she needs must feel;
She must lament, that she is now the last
Of all who gave such splendour to the past.
Still are her habits of the ancient kind;
She knows the poor, the sick, the lame, the blind;
She holds, so she believes, her wealth in trust;
And being kind, with her, is being just.
Though soul and body she delights to aid,
Yet of her skill she's prudently afraid:
So to her chaplain's care she *this* commends,
And when *that* craves, the village doctor sends.

At church, attendance she requires of all,
Who would be held in credit at the Hall;
A due respect to each degree she shows,
And pays the debt that every mortal owes;
'Tis by opinion that respect is led,
The rich esteem, because the poor are fed.

Her servants all, if so we may describe
That ancient, grave, observant, decent tribe,
Who with her share the blessings of the Hall,
Are kind, but grave—are proud, but courteous all,
Proud of their lucky lot! Behold, how stands
That grey-haired butler, waiting her commands;
The lady dines, and every day he feels
That his good mistress falters in her meals.
With what respectful manners he entreats
That she would eat—yet Jacob little eats;
When she forbears, his supplicating eye
Intreats the noble dame once more to try.
Their years the same; and he has never known
Another place; and this he deems his own,—
All appertains to him. What'er he sees
Is *ours*!—"our house, our land, our walks, our trees!"
But still he fears the time is just at hand,
When he no more shall in that presence stand;
And he resolves with mingled grief and pride,
To serve no being in the world beside.

(1) See Engraving, p. 321.

"He has enough," he says, with many a sigh,
"For him to serve his God, and learn to die:
He and his lady shall have heard their call,
And the new folk, the strangers, may have all."

But, leaving these to their accustom'd way,
The seat itself demands a short delay.
We all have interest there—the trees that grow
Near to that seat, to that their grandeur owe;
They take, but largely pay, and equal grace bestow:
They hide a part, but still the part they shade
Is more inviting to our fancy made;
And, if the eye be robb'd of half its sight,
Th' imagination feels the more delight.
These giant oaks by no man's order stand:
Heaven did the work; by no man was it plann'd.

Here I behold no puny works of art;
None give me reasons why these views impart
Such charm to fill the mind, such joy to swell the heart.
These very pinnacles, and turrets small,
And windows dim, have beauty in them all.
How stately stand yon pines upon the hill!
How soft the murmurs of that living rill!
And o'er the park's tall paling, scarcely higher,
Peeps the low church, and shows the modest spire.
Unnumber'd violets on those banks appear,
And all the first-born beauties of the year.
The grey-green blossoms of the willows bring
The large wild bees upon the labouring wing.
Then comes the summer with augmented pride,
Whose pure small streams along the valleys glide;
Her richer Flora their brief charms display;
And, as the fruit advances, fall away.
Then shall th' autumnal yellow clothe the leaf,
What time the reaper binds the burden'd sheaf:
Then silent groves denote the dying year,
The morning frost, and noon-tide gossamer;
And all be silent in the scene around,
All save the distant sea's uncertain sound,
Or here and there the gun, whose loud report
Proclaims to man that death is but his sport:
And then the wintry winds begin to blow,
Then fall the flaky stars of gathering snow,
When on the thorn the ripening sloe, yet blue,
Takes the bright varnish of the morning dew;
The aged moss grows brittle on the pale,
The dry bows splinter in the windy gale,
And every changing season of the year
Stamps on the scene its English character.

Farewell! a prouder Mansion I may see,
But much must meet in that which equals thee!
I leave the town, and take a well-known way,
To that old mansion in the closing day,
When beams of golden light are shed around,
And sweet is every sight and every sound.
Pass but this hill, and I shall then behold
The seat so honour'd, so admir'd of old,
And yet admir'd—

Alas! I see a change,
Of odious kind, and lamentably strange.
Who had done this! The good old lady lies
Within her tomb: but, who could this advise?
What barbarous hand could all this mischief do,
And spoil a noble house to make it new?
Who had done this? Some genuine son of trade
Has all this dreadful devastation made:
Some man with line and rule, and evil eye,
Who could no beauty in a tree descry.
Save in a clump, when stationed by his hand,
And standing where his genius bade them stand;
Some true admirer of the time's reform,
Who strips an ancient dwelling like a storm;
Strips it of all its dignity and grace,
To put his own dear fancies in their place.
He hates concealment: all that was enclosed
By venerable wood is now exposed;

And a few stripling elms and oaks appear,
Fenced round by boards, to keep them from the deer.
I miss the grandeur of the rich old scene,
And see not what these clumps and patches mean.
This shrubby belt that runs the land around
Shuts freedom out: what being likes a bound?
The shrubs, indeed, and ill-placed flowers, are gay,
And some would praise; I wish they were away,
That in the wild-wood maze I as of old might stray.
The things themselves are pleasant to behold,
But not like those which we beheld of old,—
That half-hid mansion, with its wide domain,
Unbound and unsubdued!—but sighs are vain:
It is the rage of Taste—the rule and compass reign.

As thus my spleen upon the view I fed,
A man approach'd me, by his grandchild led—
A blind old man, and she a fair young maid,
Listening in love to what her grandsire said.
And thus, with gentle voice, he spoke:—

"Come, lead me, lassie, to the shade,
Where willows grow beside the brook;
For well I know the sound it made,
When, dashing o'er the stony rill,
It murmur'd to St. Osyth's Mill."

The lass replied: "The trees are fled:
They've cut the brook a straighter bed;
No shades the present lords allow;
The miller only murmurs now;
The waters now his mill forsake,
And form a pond they call a lake."

"Then, lassie, lead thy grandsire on,
And to the holy water bring;
A cup is fasten'd to the stone,
And I would taste the healing spring,
That soon its rocky cist forsakes,
And green its mossy passage makes."

"The holy spring is turn'd aside,
The rock is gone, the stream is dried;
The plough has levell'd all around,
And here is now no holy ground."

"Then, lass, thy grandsire's footsteps guide,
To Bulmer's Tree, the giant oak,
Whose bows the keeper's cottage hide,
And part the church-way lane o'erlook.
A boy, I climb'd the topmost bow,
And I would feel its shadow now."

"Or, lassie, lead me to the west,
Where grow the elm trees thick and tall,
Where rooks unnumber'd build their nest:
Deliberate birds, and prudent all;
Their notes, indeed, are harsh and rude,
But they're a social multitude."

"The rooks are shot, the trees are fell'd,
And nest and nursery all expell'd:
With bitter fate, the giant tree,
Old Bulmer's oak, is gone to sea;
The church-way walk is now no more,
And men must other ways explore:
Though this, indeed, promotion gains,
For this the park's new wall contains;
And here, I fear, we shall not meet
A shade—although, perchance a seat."

"O then, my lassie, lead the way
To Comfort's Home, the ancient inn,
That something holds, if we can pay—
Old David is our living kin:
A servant once, he still preserves
His name, and in his office serves."

"Alas! that mine should be the fate
Old David's sorrows to relate;

But they were brief:—not long before
He died, his office was no more:
The kennel stands upon the ground,
With something of the former sound."

"O then," the grieving man replied,
"No further, lassie, let me stray;
Here's nothing left of ancient pride,
Of what was grand, of what was gay,
But all is changed, is lost, is sold—
All, all that's left is chilling cold;
I seek for comfort here in vain;
Then lead me to my cot again."

Crabbe.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—Montaigne.

PHYSICAL FACTS.

As an instance of the adaptation between the force of gravity and forces which exist in the vegetable world, we may take the positions of flowers. Some flowers grow with the hollow of their cups upwards; others "hang the pensive head," and turn the opening downwards. The positions in these cases depend upon the length and flexibility of the stalk which supports the flower, or, in the case of the *euphorbia*, the germs. It is clear that a very slight alteration in the force of gravity, or in the stiffness of the stalk, would entirely alter the position of the flower-cups, and thus make the continuation of the species impossible. We have, therefore, here a little mechanical contrivance, which would have been frustrated, if the proper intensity of gravity had not been assumed in the reckoning. An earth, greater or smaller, denser or rarer, than the one on which we live, would require a change in the structure and strength of the footstalks of all the little flowers that hang their heads under our hedges. There is something curious in thus considering the whole mass of the earth, from pole to pole, and from circumference to centre, as employed in keeping a snowdrop in the position most suited to the promotion of its vegetable health.—Whewell.

STITCHES IN A SHIRT.

The following singular calculation of the number of stitches in a plain shirt has been made by a sempstress in Leicester:—Stitching the collar, four rows, 3,000; sewing the ends, 500; button-holes, and sewing on buttons, 150; sewing the collar and gathering the neck, 1,204; stitching wristbands, 1,228; sewing the ends, 68; button-holes, 148; hemming the slits, 264; gathering the sleeves, 840; setting on wrist-bands, 1,468; stitching on shoulder straps, three rows each, 1,880; hemming the bosom, 393; sewing the sleeves, 2,554; setting in sleeves and gussets, 3,050; tapping the sleeves, 1,526; sewing the seams, 848; setting side-gussets in, 424; hemming the bottom, 1,104—Total number of stitches, 20,649.

ROUND TOWER, CLONMACNOISE.

THE ROUND TOWERS OF IRELAND.

(SECOND PAPER.)

THE Christian origin of the Round Towers of Ireland has been warmly advocated by several writers, and at various periods; the opinions as to their uses having been:—1. That they were anchorite towers. 2. That they were penitential prisons. 3. That they were belfries. 4. That they were keeps, or monastic treasure-houses. 5. That they were watch-towers, and beacons. The last three theories, not taken separately, as originally advanced by different writers, but united into one, and grounded on the most careful investigations, form the theory now put forth by Mr. Petrie, and of which he gives the following interesting account:—

“The towers have been all subjected to a careful examination, and their peculiarities accurately noticed; while our ancient records, and every other probable source of information, have been searched for such facts, or notices, as might contribute to throw light upon their history. I have even gone further; I have examined, for the purpose of comparison with the towers, not only all the vestiges of early Christian architecture remaining in Ireland, but also those of monuments of known or probable Pagan origin. The results, I trust, will be found satisfactory, and will suffice to establish,

beyond all reasonable doubt, the following conclusions:—

“First, that the towers are of Christian and ecclesiastical origin, and were erected at various periods, between the fifth and thirteenth centuries.

“Secondly, that they were designed to answer at least a twofold use, namely, to serve as belfries, and as keeps, or places of strength, in which the sacred utensils, books, relics, and other valuables, were deposited, and into which the ecclesiastics, to whom they belonged, could retire for security, in cases of sudden predatory attack.

“Thirdly, that they were, probably, also used, when occasion required, as beacons, and watch-towers.”

In support of the first conclusion, namely, that the towers are of Christian origin, Mr. Petrie states, that they are *never* found unconnected with ancient ecclesiastical foundations. This is not alone sufficient evidence of their Christian origin; for, as it has been reasonably remarked, it might be stated conversely, that the churches were built contiguous to the towers, in accordance with the well-known disposition of the early Christians to accommodate their worship to that of their Pagan proselytes; amongst many evidences of which, was the eager appropriation of heathen temples, and places consecrated to their gods, to Christian uses.

But the architectural styles of the round towers are found, by Mr. Petrie, to exhibit no features or peculiarities not equally found in the original churches with which they are locally connected, when such remain. And here the author endeavours to show, by most elaborate and extended research, that the Irish erected churches and cells of stone, without cement, at the very earliest period after the introduction of Christianity into the country; and he thinks they could not possibly have remained ignorant of the use of lime cement in their religious edifices after the immigration of that crowd of foreign ecclesiastics, Egyptian, Roman, Italian, French, British, and Saxon, who flocked to Ireland, as a place of refuge, in the fifth and sixth centuries. He then considers the remains of the existing churches themselves, which are, indeed, of high interest, and, as figured in his work, carry an undoubting conviction to the mind of very remote age. The ancient quadrangular doorways, the sides inclining inwards towards the top, and covered with a horizontal lintel composed of a single stone, are found almost universally in the primitive churches of Ireland. Yet there are some examples of doorways, apparently of nearly equal age, having the semicircular arch. The windows in these ancient churches are always of a single light, and are extremely simple in their forms. Frequently they are triangular-headed, two large stones being inclined to form the head, and, in none of them, of whatever form, does there appear to be any provision for the reception of sashes, or glass. It would be interesting, though beside our purpose in this brief notice, to follow Mr. Petrie through several of his valuable notices of the ancient churches of Ireland; but, referring our readers to his valuable work for abundant information, we can only give a general idea of the simplicity of these edifices, by noticing that called Tempull Ceannanach, on the Middle Island of Aran, in the Bay of Galway. This little church, wanting in nothing but its stone roof, measures on the inside sixteen feet six inches in length, and twelve feet six inches in breadth; and its walls, which are three feet in thickness, are built in a style quite Cyclopean, the stones being throughout of great size, and one of them not less than eighteen feet in length, which is the entire external breadth of the church, and three feet in thickness. In the extreme simplicity of these churches, their dimly-lighted nave, their total absence of everything which could distract the worshipper's attention, our author rightly judges that there is "an expression of fitness to their purpose, too often wanting in modern temples of the highest pretensions."

Some of the features found in these ancient churches are likewise to be found in the round towers, while, in no one building in Ireland assigned to pagan times, have been found either the form or features of these towers, or, indeed, any characteristics that would imply sufficient skill in the architects to construct such edifices. It is also a fact that on several of the round towers Christian emblems are observable, while others display in their details a style of architecture universally acknowledged to belong to Christian times.

The evidence adduced on these subjects must be examined and weighed by those who would come to a decision on this interesting point; and, if found satisfactory, there will scarcely be much difficulty in agreeing to the reasonableness of the uses assigned to the round towers. Their construction was well adapted to the double purpose of belfries and castles; and, when it is considered that the former kind of building is known to have existed from a very early period in connexion with the cathedral and abbey churches of Ireland, and that no other building suited to the purpose of a belfry has ever been found in connexion with any church of an age anterior to the twelfth century (except a square belfry attached to a church in an island of Lough Ree), there is much reason to think that in these towers we have the belfries in question. It is also well known

that the round towers are considered as belfries by the people of Ireland, whose traditions favour the supposition, and who even use the towers as bell-towers in many parts of the country at the present day.

The opinion that the round towers were fortresses as well as belfries, rests much on some of the peculiarities found almost universally in their construction, particularly on their small doorways, placed at such a height from the ground. The most ancient military towers in Britain, subsequent to Roman times, are invariably of the same lofty and circular form, having their doorways small, and considerably elevated from the ground. That the round towers were designed as places of security, in addition to their other uses, may also be inferred from the fact, that many of their remaining doorways exhibit evidences of their having been provided with double doors.

Mr. Petrie has found good reason to infer that some of the round towers were existing in the seventh century, but he is disposed to assign the great majority to the ninth and tenth centuries, while he is persuaded that some were erected as late as the twelfth, of which their architectural characteristics seem to afford proof. The respective ages of these towers, as determined by a close examination of their architecture, and a comparison of each with the ancient churches, whose dates are determined, or may be fairly presumed, is to form the third part of Mr. Petrie's inquiry, to be published at a future period. But he gives the measurements and interior construction of two of the most ancient towers, *i.e.*, those of the round tower of Clondalkin, near Dublin, and of the tower of Rattoo, in the county of Kerry. The tower of Clondalkin has, it appears, a singular projecting base, which is nearly thirteen feet in height, and composed, in great part, of solid masonry. In this it resembles the tower of Roscarbery, in the county of Cork, which no longer exists, but is figured on an ancient seal; and both these towers resembled, in this respect, the ancient castle of Brunless, in Brecknockshire. Above the base this tower of Clondalkin measures forty-five feet in circumference, and, with the exception of the chiselled stones round its doorway, it is altogether constructed of common rubble masonry, of the calp limestone of the district. The apertures are all quadrangular, and the jambs of the doorway incline, like those of the oldest churches. Of the original ecclesiastical edifices, which were of considerable importance, the tower alone remains.

The tower of Rattoo is remarkable for being placed on a terrace or platform, connected with a causeway, which extends in a line opposite its doorway. The tower is formed of roughly-squared hammered sandstone, the entrance doorway alone being chiselled. It measures forty-seven feet nine inches in circumference at its base, and ninety-two feet in height, the wall being three feet ten inches in thickness at the doorway. The doorway is semicircular-headed, the arch being formed of three stones, and it is ornamented with a flat band, nine inches in breadth. The tower is divided into six stories, that at the top containing, as usual, four large apertures, facing the cardinal points. The tower is enveloped in ivy, hiding the situation of several of the windows. Between the floors of each story, there project from the wall on the interior, rough corbel stones, which have been supposed to be for the purpose of fixing ladders to join the stories, (as there are no staircases in these towers,) or as supports for shelves, on which the precious things were deposited. As in the case of the former tower, so in this also, an ancient ecclesiastical establishment, the seat of a bishopric, once occupied this place. The tower is now popularly known by the name *Giolcach*, by which is understood a bell-house, and which is a local corruption of *cloigtheach*, the general name for the round towers. According to the tradition of the place, there was a silver bell placed in the upper story of the tower, which had a remarkably sweet tone, and this bell is

now concealed in the adjacent river Brick, into which it was thrown for safety during the "troubles." But the bell, though formerly emitting melancholy sounds to show where it lay, is now silent, and cannot be found.

It has been already noticed that some of the round towers exhibit Christian emblems. An example of this occurs in the quadrangular doorway of the tower of Antrim. This doorway, which is placed at an elevation of about twelve feet from the ground, is constructed of large blocks of coarse-grained basalt found in the neighbourhood, some of which extend the whole thickness of the wall, that is, three feet three inches. On a stone immediately over the lintel is a pierced cross, within a circle, sculptured in *relievo*, and somewhat resembling one that exists on the lintel of the doorway of the ancient church of St. Fechin, at Fore. The foundation of the church at Antrim has been ascribed to St. Mochaoi, a cotemporary of St. Patrick's, who died about the year 496, but popular tradition ascribes the erection of the tower to a celebrated builder, Goban Saer, who flourished in the seventh century. The doorway of the round tower of Donaghmore, in the county of Meath, is likewise remarkable in having a figure of the Saviour crucified, sculptured in *relievo* on its key-stone and the stone immediately over it. Those who doubt the Christian origin of the round towers affirm this to be an after work, but there appear to be no just grounds for the assertion. A similarly ornamented doorway, having a representation of the crucifixion, but with richer sculptures, is found in the round tower of Brechin, in Scotland.

Mr. Petrie's remarks have also extended to the minor edifices, connected with the ancient religious establishments of the Irish, such as the houses or cells of the ecclesiastics. In the north and east of Ireland these were usually of perishable materials, such as wood and clay, but in the western and southern parts of Ireland abundant examples occur in stone, from which it appears that the ecclesiastical houses were usually of a round or oval form, and differed little from the ordinary buildings in use among the ancient inhabitants generally. In the earliest religious establishments of Ireland, the abbot, clergy, and monks had each their distinct and separate cells, and such other buildings as the house for strangers, the kitchen, &c., were also separate edifices, the whole being surrounded by a cashel, or circular wall, and forming a kind of ecclesiastical town, like those of the early Christians in the east, and known among the Egyptians by the name of Laura.

One of the most interesting and best preserved of these ancient establishments is that of St. Fechin, on the uninhabited and almost inaccessible island called Ardoilen, or High Island, off the coast of Connemara, on the north-west of the county of Galway. The description of this relic of past ages is too valuable to be abridged. "The Church here," says Mr. Petrie, "is among the rudest of the ancient edifices which the fervour of the Christian religion raised on its introduction into Ireland. Its internal measurement, in length and breadth, is but twelve feet by ten, and in height ten feet. The doorway is two feet wide and four feet six inches high, and its horizontal lintel is inscribed with a cross, like that on the lintel of the doorway of St. Fechin's great church at Fore, and those of other doorways of the same period. The east window, which is the only one in the building, is semicircular-headed, and is but one foot high and six inches wide. The altar still remains, and is covered with offerings, such as nails, buttons, and shells, but chiefly fishing-hooks, the most characteristic tributes of the calling of the votaries. On the east side of the chapel is an ancient stone sepulchre, like a pagan Kistvaen, composed of large mica slates, with a cover of limestone. The stones at the ends are rudely sculptured with ornamental crosses, and a human figure; and the covering slab was also carved, and probably was inscribed with the name of the saint for whom the tomb was designed, but its surface is now much effaced; and as this sepulchre appears to have

been made at the same time as the chapel, it seems probable that it is the tomb of the original founder of this religious establishment. The chapel is surrounded by a wall, allowing a passage of four feet between them; and from this, a covered passage, about fifteen feet long by three wide, leads to a cell, which was probably the abbot's habitation. This cell, which is nearly circular, and dome-roofed, is internally seven feet by six, and eight high. It is built, like those in Aran, without cement, and with much rude art. On the east side there is a larger cell, externally round, but internally a square of nine feet, and seven feet six inches in height. On the other side of the chapel are a number of smaller cells, which were only large enough to contain each a single person. They are but six feet long, three feet wide, and four feet high, and most of them are now covered with rubbish. These formed a Laura, like the habitations of the Egyptian ascetics. There is also a covered gallery, or passage, twenty-four feet long, four feet wide, and four feet six inches high, and its entrance doorway is but two feet three inches square. The use of this it is difficult to conjecture. Could it have been a storehouse for provisions?

"The monastery is surrounded by an uncemented stone wall, nearly circular, enclosing an area of one hundred and eight feet in diameter. The entrance into this enclosure is at the south-east side, and from it leads a stone passage, twenty-one feet in length, and three in width. At each side of this entrance, and outside the great circular wall, were circular buildings, probably intended for the use of pilgrims; but, though what remain of them are of stone, they do not appear to have been roofed with that material. Within the enclosure are several rude stone crosses, probably sepulchral, and flags sculptured with rude crosses, but without letters. There is also a granite globe, measuring about twenty inches in diameter.

"In the surrounding ground, there are several rude stone altars, or penitential stations, on which are small stone crosses; and on the south side of the enclosure there is a small lake, apparently artificial, from which an artificial outlet is formed, which turned a small mill; and along the west side of this lake, there is an artificial stone path, or causeway, two hundred and twenty yards in length, which leads to another stone cell, or house, of an oval form, at the south side of the valley in which the monastery is situated. This house is eighteen feet long, and nine wide, and there is a small walled enclosure joined to it, which was probably a garden. There is also adjoining to it a stone altar surmounted by a cross, and a small lake, which, like that already noticed, seems to have been formed by art."

Such are the curious relics of antiquity now brought before the public notice, and we are sure that every candid and qualified reader, on examining Mr. Petrie's book, will find abundant reason to prize such revelations of the past, and to look forward with much anxiety for the completion of this beautiful work. And if, with a talented writer of the present day, we believe that to take an interest in the ancient history of Ireland is the best way to win the hearts, and to soften the prejudices of the Irish themselves, we may indeed congratulate ourselves on the appearance of a work so eminently calculated to excite that interest. The following remarks of the writer just alluded to, are worthy the attention of all who wish well to Ireland:—"We do believe that one of the great avenues to the hearts of the Irish nation is by recognising, fostering, appealing to, valuing as a great treasure, in which Englishmen have a common interest, their deeply-cherished, worthily cherished nationality, fed as it is to this day by the traditions and memories of that very period to which Mr. Petrie's researches have carried us back. These memories have been never forgotten among the peasantry; and now that they have been exhumed and set before the more cultivated classes, they will produce on them also a very powerful impres-

sion. The nobility of Ireland are beginning to take in them deep and increasing interest. The formation of the Museum of Antiquities in the Academy, a work, the merit of which must be given to Mr. Petrie, has given a powerful stimulus to his own branch of study. The cultivation of the Irish language is proceeding rapidly, and a class has been formed in the Academy itself. To the same Academy and the prize proposed by it, for the investigation of the round towers, we owe the present volume; and, had the Society accomplished nothing more, it would deserve the support of every lover of Ireland. Within the last year, in consequence of the zealous energy of Lord Adare, three great exertions have been made, all bearing in the same direction. A

large and valuable collection of Irish manuscripts has been purchased, and deposited in the library of the Academy. A College has been founded, (under the highest ecclesiastical authority) for the purpose of providing for the higher classes of Ireland the highest form of education, and giving to them at the same time a knowledge of the Irish language, as the most powerful means of reaching the hearts and understandings of the people, whether as their landlords or their clergy. And efforts, we hope and believe not yet to be wholly despaired of, have been made to bring before the government, and to obtain from it aid in carrying on, one of the most grand designs of topographical and antiquarian research ever projected or commenced."

BRECHIN CHURCH, AND TOWER.

KÖRNER.

As an appendage to the short sketch of the life of Körner which we gave in a previous Number, we now present our readers with two short specimens, one of his prose and the other of his poetical writings, as translated by Mr. Richardson. We have not selected these as by any means the best, but as, from their length, the most suitable for our columns.

We have thought it preferable to place the poetical extract in the column usually devoted to poetry. (See page 351.)

THE HARP.

THE Secretary and his young wife were yet in the gay and glittering spring of life. Neither interest, nor a mere passing inclination, had united them. No; love, ardent, long-tried love, had been the seal of their union. They had early become acquainted with each other's sentiments; but the delay of Sellner's preferment had constrained him to put off the completion of his wishes. At length he received his appointment, and the next

Sunday he led his true love, as his wife, to his new dwelling. After the long and constrained days of congratulation, and of family festivals, they could, at length, enjoy the fair evening, in cordial solitude, undisturbed by any third person. Plans for their future life, Sellner's flute, and Josepha's harp, filled up those hours, which only appeared too short for the lovers; and the sweet harmony of their tones was as to them a fair prelude of their future days. One evening, they had enjoyed themselves so long with their music, that Josepha began to complain of head-ache. She had concealed an indisposition which she had experienced in the morning from her anxious consort; and an, at first, unimportant attack of fever was, by the excitement of the music and the exertion of the mind, the more increased, as she had, from her youth, suffered much from weak nerves. She now concealed it no longer from her husband, but anxiously sent Sellner after a physician. He came, treated the matter as a trifle, and promised that she would be much better in the morning. But, after an extremely restless night, during which she was constantly delirious, the physician found poor Josepha in a state which had all the symptoms of strong nervous fever.

He employed all the proper means, but her illness grew daily worse.

On the ninth day, she herself felt that her weak nerves would no longer sustain this malady; indeed, the physician had already mentioned this to Sellner before. She knew herself, that her last hour was come, and with tranquil resignation she awaited her fate.

"Dear Edward," she said to her husband, as she drew him for the last time to her breast, "with deep regret do I leave this fair earth, in which I have found thee, and found true happiness in thy love; but now I may no longer remain happy in thine arms, yet shall Josepha's love still hover o'er thee, as thy good angel, until we meet again on high!"

Having said this, she sank back, and fell asleep for ever. It was nine o'clock in the evening. What Sellner suffered was inexpressible; he struggled long for life; the shock had destroyed his health; and when, after many weeks' illness, he recovered, there was no more the strength of youth in his limbs; he sank into a hollow melancholy, and evidently faded away. A deep sadness took place of his despair, and a silent sorrow hallowed the memory of his beloved. He had Josepha's chamber left in the same state in which it was before her death. On a work-table lay her needle-work, and in the corner was her harp, silent and untouched. Every evening did Sellner go on a pilgrimage to this sanctuary of his love, took his flute, leaned, as in the times past of his happiness, on the window, and breathed, in mournful tones, his regret for the beloved shade.

Once he stood thus, lost in fancy, in Josepha's chamber. A clear moonlight night wafted to him its gentle breezes through the open window, and, from a neighbouring castle tower, the watchman called the hour of nine—the harp woke its tones again, as if swept by the breath of a spirit. Strangely surprised, he hushed his flute, and with it ceased the echo of the harp. He sang now with deep emotion Josepha's favourite air; and louder and stronger did the strings resound the melody, while their tones accorded in perfect unison! He sank in joyous emotion on the earth, and spread his arms to embrace the beloved shade. Suddenly he felt himself breathed on, as if by the warm breath of spring, and a pale and glimmering light flew over him! Strongly inspired, he called out,

"I know thee, beloved shade of my sainted Josepha! Thou didst promise to hover o'er me with thy love, and that promise thou hast fulfilled. I feel thy breath—thy kisses on my lip; I feel myself embraced by thy glory!"

With deeper bliss, he seized anew the flute; and the harp sounded again, but yet lower and lower, until its whispers dissolved in distant and indistinct sounds.

Sellner's whole faculties were powerfully excited by the apparition of this evening; he threw himself, restless, on his bed, and in his feverish dreams the whispers of the harp yet called on him again. He awoke late, and harassed with the phantasies of the night, he felt his whole being wondrously affected; and perceived a voice within him, which was the anticipation of a speedy dissolution, and which indicated the victory of the soul over the body. With infinite desire he awaited the evening, and passed it in Josepha's chamber.

He had already lulled himself into a sweet dream by means of his flute, when it struck nine—and scarcely had the last stroke of the clock echoed, when the harp began to sound softly, until at length it vibrated in full accord. As his flute ceased, the spirit-tones ceased with it; the pale and glimmering light flew over him again, and in his bliss he could only utter the words,

"Josepha! Josepha! take me to thy faithful breast!"

For the present, the harp took leave with light and gentle murmurs, till its whispers again were lost in low and trembling sounds.

Strangely affected by the occurrences of the evening, Sellner, as before, tottered back to his chamber. His faithful servant was alarmed by the appearance of his master, and hastened, notwithstanding his orders to the

contrary, to the physician, who was, at the same time, an old friend of Sellner's. He found him with an attack of fever of the same symptoms as Josepha had had, but of far stronger kind. The fever increased considerably throughout the night, during which he continually raved of Josepha, and of the harp. In the morning he was more composed; for the great struggle was over, and he felt, clearly, that his dissolution was at hand, though the physician did not perceive it.

The patient disclosed to his friend what had taken place on both evenings; and no opposition of the cool-minded man could bring him from his opinion. As the evening came on, he grew yet weaker, and begged, with trembling voice, to be carried to Josepha's chamber. This was done. With infinite serenity he gazed around, hailed its fair recollections with silent tears, and spoke calmly, but firmly, of the hour of nine, as the time of his death. The decisive moment approached, and he desired all to quit his chamber, after he had bid them farewell, except the physician, who persisted in remaining. The ninth hour at length sounded hollow from the castle tower, Sellner's face was transformed, and a strong impulse glowed upon his pallid countenance.

"Josepha," he cried, as if impelled by Heaven, "Josepha, hail me yet once more on my departure, that I may feel thee near, and may overcome death by thy love!"

Then rang the strings of the harp in tones loud and brilliant as the songs of victory, and over the departing one waved a glimmering light!

"I come! I come!" he said, and sank back, struggling for life.

Yet lower and lower rang the tones of the harp, his last strength was now exhausted by convulsion, and as he departed, the harp-strings broke at once, as if torn by a spirit's hand.

The physician, trembling, closed the eyes of the deceased, (who, notwithstanding his contest with death, lay as in a gentle slumber,) and left the house in deep emotion. For a long time, he was unable to dismiss from his mind the impression of this scene; and he observed a strict silence as to the last moments of his friend; until at length, in an hour of social confidence, he imparted to some friends the occurrence of this evening, and at the same time showed them the harp, which he had received as a last legacy from the deceased.

THE NORTHERN MARCHES, AND THEIR WARDENS.

THE word March is of Saxon origin, and signifies a boundary. The German title Margrave, and the English Marquis, are derived from it, and meant, originally, officers who had command upon the marches, or frontiers, of their respective countries. An etymologist would not fail to mention that the tribe, whose name Cæsar has Latinized into Marcomanni, were marchmen, or people who lived upon the confines of the German territory. In England, we have applied the term to the parts lying adjacent to Wales and Scotland, but it is only of the Northern Marches that we intend to speak in the present article.

To such a height did violence and rapine arrive in this district, that functionaries were appointed by the English monarchs under the title of Lord Wardens, at first, for purposes of aggression and defence, but latterly, when the two kingdoms were united under one head, in order to put down disturbances, and punish breaches of the peace, on either side of the border. Their jurisdiction was divided into three parts, distinguished as the East, Middle, and West Marches. The office was one of eminent trust, and usually committed to persons of high rank. Accordingly, we find chiefs of the great families of Clifford, Percy, Scroop, Neville, and Dacre, actively executing the arduous duties of Lord Warden. It is at least as ancient as the reign of Edward I.; at which period, the feelings of

mutual jealousy with which the two nations regarded each other, were exasperated on the part of our northern neighbours, by the frivolous but pertinacious claim of that king to the Scottish crown. The power with which a Lord Warden was armed was of the amplest kind. It extended over life and death; he could hang and imprison at pleasure; he had a court distinct from his sovereign's, in which suits could be carried on, and culprits tried, as in the superior courts; at a moment's warning, he could summon every male, between the ages of sixteen and sixty, within his territory, to arm, and march into the field. Extraordinary as this authority may seem, it will not be wondered at, if the habits of the borderers are considered. The utmost confusion reigned throughout the district; fire and slaughter, abetted by the rival monarchs, robberies and hostile encounters, provoking cupidity, and supplying food for brutal excitement amongst their subjects, raged alternately in the two countries, and sometimes in both at once. There was a perfect organization for offence and defence in both kingdoms. Hills were marked out whereon beacon-fires blazed at times of actual or anticipated danger; bloodhounds were kept at certain places, to assist in the pursuit of fugitives; lines of watches were posted from sea to sea; and every man held himself in readiness to handle his weapons, and mount his horse.

Old Froissart takes an opportunity of mentioning the quarrels of the borderers in his rambling Chronicle. "Englishmen on the one party, and Scots on the other party, are good men of war; for when they meet, there is a hard fight, without sparing. There is no truce between them as long as spears, swords, axes, or daggers, will endure; but they lay on each other, and when they are well beaten, and one party has obtained the victory, they glorify so in their deeds, and are so joyful, that such as are taken, are permitted to go free, or be ransomed; and, in a short time, both sides are so content with each other, that, on parting, they will courteously say, "God thank you."

More particularly was this state of things the case with that unlucky region, termed the Debateable Ground. There is a story of a favourite cow, belonging to King James, that, not liking her accommodations in England, found her way back, unguided, to Edinburgh. The king remarked, that he was not so much surprised at the animal's instinct in smelling out the road, as that she got through the Debateable Ground without being stolen. Had it been observed to James, that this desire of returning to the north was singular, and, of all his train, only shared by her, it is not unlikely he would have answered, with the same kind of dry humour, that she was a brute, and knew no better.

The rancorous hatred which subsisted between England and Scotland, with the evil deeds to which that feeling led, has been so forcibly sketched by Shakspeare, in "Henry V.," that we shall quote the passage at length. The king is supposed to be conferring with his lords, on the best means of attacking France:—

"We must not only arm to invade the French,
But lay down our proportions to defend
Against the Scot, who will make road upon us
With all advantages."

"They of those marches, gracious sovereign,
Shall be a wall sufficient to defend
Our inland from the pilfering borderers."

"We do not mean the coursing snatchers only,
But fear the main intendment of the Scot,
Who hath been still a giddy neighbour to us;
For you shall read, that my great grandfather
Never went with his forces into France,
But that the Scot on his unfurnished kingdom
Came pouring like a tide into the breach
With ample and brim fullness of his force;
Galling the gleaned land with hot essays;
Girding with grievous siege, castles and towns;
That England being empty of defence
Hath shook and trembled at the ill neighbourhood."

In these turbulent contests we may trace one main source of the old ballad poetry, and, what is more important, to the external fate of the country at least, from

them sprang the necessity of constructing those chains of strongholds, the very ruins of which are magnificent to this day, to be the dwelling-places and safeguards of the powerful barons of the border. The noble family of Clifford had five mighty castles; the great house of Percy numbered four enormous fortresses amongst their possessions. The Nevilles secured themselves in Raby Castle; the Dacres at Naworth. Here it was that they held their miniature courts, and had their presence-chambers, before "they exchanged the hospitable magnificence of a life spent amongst their kinsmen and clansmen, for the uncertain honours of court attendance, and the equivocal rewards of ministerial favour." Here they were equally ready, as humour inclined, or circumstances compelled, to avenge an insult, or commit an injury. The mottoes borne by the chieftains, were very often a sufficient index to the spirit by which the clans were animated, and to the suspicious or hostile feelings with which they regarded their neighbours. The Murrays bore, "Furth Fortune, and fill the Fetters;" the Douglasses had, "Lock sickle;" the Drummonds, "Gang warily;" whilst the Cranstouns audaciously declared, "Thou shalt want ere I want."

It is amusing to glance over the code of laws established in the marches, and to reflect that the time has but recently gone by, when they were both defied and enforced. Amongst a variety of ordinances, there are the following:—

That every man do rise and follow the fray upon blowing of horn, shout, or outcry, upon pain of death.

That no man practise with rebel, thief, or murderer, but that the same be opened to my lord warden.

That no subject speak with any Scotchman, except upon license so to do of my lord warden or of the deputy wardens.

There are also regulations as to pursuing fugitives and offenders "in hot trod" with hound and horn, with hue and cry; as to the levying of black mail, which was a rent exacted by the upper class of plunderers on pretence of protecting the payers from spoil from others; and, in a more peaceful spirit, it was ordered that if it fell out that any deadly feud were borne against any of the opposite realm for executing any thief by justice, or killing him with red hand where he was found stealing, or clad with stolen goods, or for pursuing to death by whatsoever lawful means, the warden, upon signification of the feud, should apprehend that party, and either cause him then and there to renounce his feud by writing under his hand, or should deliver him to the opposite warden to be kept by him until he made the required renunciation. The form of oath administered upon the trial of an offender was of the utmost solemnity. "You shall swear by heaven above you, hell beneath you, by your part of paradise, by all that God made in six days and seven nights, and by God himself." These were English laws, but on the northern side of the border the regulations were equally stringent. It was enacted that no manner of person of any degree should intercommune with any English without special license. That at what time it was seen speedful that the host light down and array themselves, that each man light down at commandment, and whoso did not, should be noted as a traitor, and punished for open treasons. That if there happened a chase, whatever he were that took his fellow's horse, if he won any goods on him, he that owed the horse should have the half of it, and he should bring the horse again to the stake. And if it happened that he fled on that horse, as soon as he came home he should pass to the market of the shire, and proclaim him. That it was lawful to any man to take as many prisoners as he might, both on horse and foot, so that he led them with the strength of Scotsmen; and to take a token of his prisoner with him that he might be sufficiently known, and to leave his token with his prisoner. That if a prisoner were taken, and divers persons contend about him, he should be at the command

of the warden, delivered in even hands, or else in the warden's hands, and the parties should challenge at the warden's court; and that the reward for apprehending a traitor should be a hundred shillings.

Peculiar tenures were the consequence of this state of things, and *csuage*, *drengage* and *cornage* are services by which some lands on the border are holden to this day. The service by *csuage* was when a royal army marched not indeed against the borders particularly, but against the kingdom of Scotland. Those who held by *cornage* were obliged to wind a horn, (*cornu*), to give their countrymen notice of the approach of enemies. Even the diversions of children had reference to border animosities; and in some places the boys have a game at the present time which they call *Scotch* and *English*, an exact picture of the *raid*, that is, the inroad by plundering parties. The boys divide themselves into two companies, under separate captains, one side being *Scots*, the other *English*. They begin their violent recreation by stripping off their coats and laying them in two heaps not far apart. A stone is set up in the middle as a boundary mark between the "two mighty monarchies, whose high upreared and abutting fronts" are in imaginary contention. They then begin to make incursions into each other's territories, the *English* using this reviling expression—"Here's a leap in thy land, dry bellied *Scot*." The main points in the game are to steal away the clothes of the other side, and to take prisoner any one who has invaded his opponents jurisdiction in search of *wad*, or booty. This word *wad* signified originally a pledge, and in this sense it is used in the ballad of "Auld Maitland."

"He spurred his gray into the path
Till baith his sides they bled;
Gray! thou maun carry me away,
Or my life lies in wad."

When a prisoner is captured he is taken to the back part of his adversary's land, where he is supposed to remain in safe custody until one of his own party break in, and by swiftness of foot lay hold of the captive before he himself is touched by an enemy, in which case he has rescued his companion in arms.

The bloodhounds employed to track fugitives were staunch animals carefully trained for this purpose. Various plans for baffling their sagacity were adopted. Robert Bruce escaped on one occasion by wading a short distance down the middle of a brook. The spilling of blood upon the track was a sure way to evade the pursuit, for the discriminating fineness of the dog's scent was thereby destroyed. Sometimes, there was no hesitation in killing a prisoner to effect this object, and there is a story told by Henry the minstrel of Wallace, who made use of this bloody expedient. The hero's hand had been joined by a man named Fawdon, who, from his behaviour, excited suspicion of intended treachery. Wallace was obliged to retreat after a hard fought skirmish with only sixteen followers, and the *English* were in hot pursuit with their bloodhound. Fawdon, at some part of their flight, persisted in going no farther, and Wallace, in a moment of irritation, struck off his head and pursued his way. The bloodhound upon coming up stayed upon the dead body. The story concludes with what Sir Walter Scott thought a fine Gothic scene of terror. Wallace was alarmed at midnight in the lonely Tower of Gask, where he had taken refuge, by the wild blasts of a horn. He sent his followers in pairs to ascertain the occasion of this circumstance, but none of them returning, he issued out himself, sword in hand. At the gate he encountered the decapitated spectre of the man he had slaughtered in his hasty anger. He retreated in an extremity of terror, and rushing through a window, fled up the river. Upon turning his eyes to the tower he had just quitted, he saw it in a blaze, and the ghost of the murdered man wondrously increased in size, stood upon the battlements, grasping a burning rafter.

(1) Shakspeare's Henry V.

The bale fires, or beacons we have mentioned before, formed in Scotland a fiery chain of communication between the border and the capital. An act of the Scottish Parliament in 1455, directs that one bale or faggot should forewarn the approach of the *English* in any manner; two bales that they were indeed coming; four bales that the enemy was unusually strong. The striking appearance of these beacons blazing through the gloom like prophetic comets, and startling the night, has been graphically sketched by Scott in his *Lay of the Last Minstrel*.

"On the high turret sitting lone,
Her blue eyes sought the west a-far,
For lovers love the western star.
Is yon the star, o'er Penchyrst Pen,
That rises slowly to her ken,
And spreading broad its wavering light
Shakes its loose tresses on the night?
Is yon red glare the western star?
O, 'tis the beacon blaze of war!
Scarce could she draw her tightened breath,
For well she knew the fire of death!
The warden viewed it blazing strong,
And blew his war note loud and long;
The blast alarmed the festival hall,
And started forth the warriors all;
Far downward in the castle yard,
Full many a torch and cresset glared;
And helms and plumes confusedly tossed,
Were in the blaze half seen, half lost.

* * * * *
'Ride, Alton, ride for death and life,
And warn the Warden of the strife;
Young Gilbert, let our beacon blaze,
Our kin, and clan, and friends to raise.'
The ready page, with hurried hand,
Awaked the need-fire's slumbering brand,
And ruddy blushed the heaven;
For a sheet of flame, from the turret high,
Waved like a blood flag in the sky,
All flaring and uneven:
And soon a score of fires, I ween,
From height, and hill, and cliff, were seen;
Each with warlike tidings fraught:
Each from each the signal caught;
Each after each they glanced to sight,
As stars arise upon the night.
They gleamed in many a dusky tarn,
Haunted by the lonely eern;
On many a cairn's gray pyramid,
Where urns of mighty chiefs lay hid;
Till high Dunedin the blazes saw
From Soltra and Dumpender Law;
Till Lothian heard the Regent's order,
That all should bowne them for the Border."

The first lord warden on the *English* side, with whose name history has made us acquainted, was Robert de Clifford, Lord High Admiral to Edward II., slain in the disastrous battle of Bannockburn. The fine old ballad of Chevy Chase, that stirred Sir Philip Sidney like the sound of a trumpet, and celebrates the battle of Otterbourne, fought in 1388, between Percy Earl of Northumberland, and Earl Douglas, in which the former was killed and the latter taken prisoner, had its rise in a quarrel respecting their marches. It would seem an unfit office for an ecclesiastical dignitary to hold; nevertheless amongst the names of secular warriors we find those of the bishops of Durham and Carlisle, and a dean of St. Paul's, who were wardens. But in the olden time there was many a prelate besides the haughty cardinal Wolsey, who was

"More like a soldier than a man o' th' Church,
As stout and proud as he were lord of all."

In one great battle three bishops "translated themselves out of the speech of peace," and doffed their "white investments" to assume armour and grasp the sword. When Edward I. undertook his expedition against Scotland, Anthony Beck, Bishop of Durham, accompanied him, and, if Blind Harry the minstrel is to be credited, he narrowly missed having the "grinning honour" to die by the hand of Wallace in a skirmish on the street of Glasgow. There is a pleasant anecdote told by Lord Bacon, in his *Apophthegms*, of a certain military bishop, on whose account, (having been taken prisoner in battle by the King of Hungary,) the pope addressed a monitory letter to the king, telling him that he had broken the privilege

of Mother Church, and taken his son; whereupon the king in reply sent a message to the pope, with the armour in which the captive had been habited, with this inquiry: "Can this be the clothing of a son of yours?" And even Popes themselves have sometimes exchanged the tiara for the helmet, and laid down the crozier to take up the sword. When Michael Angelo was engaged on the colossal statue in bronze of Julius II., which is not now in existence, his holiness was asked if a book was to be put into his left hand. "No," was the reply, "give me a sword, I am no bookman."

In the reign of the eighth Harry, Sir Thomas Wharton, Governor of Carlisle and Warden of the Marches, performed so brilliant an exploit that it gained him a peerage. With an army of 1400 horse and foot he routed 15,000 Scotch at Solway Moss, taking seven noblemen and almost every other person of distinction prisoners. Eight hundred common soldiers, with all the baggage and artillery, also fell into his hands. It is reported that the Scotch army being deeply offended by the conduct of their monarch, James V., in placing it under the command of Oliver Sinclair, his upstart favourite, utterly refused to strike a blow. It is not improbable that Wharton had beforehand received intimation of the true state of the case, otherwise it is scarcely credible he would have ventured to attack a force so greatly superior to his own. If revenge was the object of this suicidal act, that object was completely attained, for the unhappy monarch died of a broken heart within a month of the engagement. Henry, who hated the Scotch even more intensely than he did the Pope, was overjoyed at the news of this occurrence. He rewarded Sir Thomas with a barony, giving him a special augmentation to his arms in memory of the event, and bestowed on him several valuable estates, the produce of ecclesiastical confiscation. He was continued in his offices, and there is a letter from the king to his Warden yet extant, in which his majesty declares an intention of prosecuting his enterprise against Scotland, "whereby the wars cannot shortly be determined, but be like to have a long continuance." The *carte blanche* presented to his lordship for the diversion of slaughter on a large scale, was not filled up by him with a low figure, as we may gather from a document preserved in the State Paper Office, which professes to give an account of four months' foray. The substance of it is that 192 towns, towers, churches, farmsteads, &c. were cast down or burned; 403 Scots slain, 816 prisoners taken, upwards of 10,000 head of horned cattle, and 12,000 sheep carried off, &c. &c. A large fund of amusement here for those who liked excitement and carnage! Possibly this raid is one of those recommended in "the openyons of Sir Thomas Wharton and others for annoyance as they trust in God shal be done to Scotland this wynter by the West Marchers of Yngland;" another document in the State Paper Office.

A few years later, we find Thomas Lord Dacre filling the office of Warden. A letter from this warlike baron to Cardinal Wolsey (written in 1514, the year after Flodden Field was won, and printed in Ellis's collection), contains this passage, indicative alike of the times and the man: "There never was so mekyl myschiefe, robbery, spoyling and vengeance in Scotlande then there is now without hope of remedye which I praye our Lord God to continewe." It should not be forgotten that this was written by a person whose office was to preserve peace, to a minister of religion. The impiety of these invocations to the Almighty on the subject of deeds so savage and brutal, can only be exceeded by the desecration which the churches of the God of peace have occasionally suffered, when *Te Deums* have been sung, and thanks returned, for sacrifices previously offered up at the temple of Moloch; such as Catherine of Russia commanded after the siege of Ismail, and *le Grand Monarque*, after the devastation of Heidelberg. In another letter addressed to the Cardinal by Lord Dacre, he gives an account of an inroad made upon his estate,

by Nixons, Armstrongs, and other clans, inhabiting the debateable country, to the number of three hundred, who killed eleven of his servants, and took others of them prisoners.

Fuller, the church historian, reckoned the border marauders amongst the wonders of Cumberland, and gives, in his own quaint way, an account of their increase, height, and decay. "When England and Scotland were united in Great Britain, they that formerly lived by hostile incursions, betook themselves to the robbing of their neighbours. The sons are free of the trade by their father's copy. They are like to Job, not in piety and patience, but in sudden plenty and poverty; sometimes having flocks and herds in the morning, none at night, and, perchance, many again next day. They may give for their motto, *vivitur ex rapto*, stealing from their honest neighbours what they sometimes require. They are a nest of hornets; strike one, and stir all of them about your ears. Indeed, if they promise safely to conduct a traveller, they will perform it with the fidelity of a Turkish Janisary; otherwise, woe be to him that falleth into their quarters! Height—amounting forty years since to some thousands. These compelled the viceroy to purchase their security by paying a constant rent to them. When in their greatest height, they had two great enemies, the laws of the land, and the Lord William Howard, of Naworth. He sent many of them to Carlisle, to that place where the officer always does his work by daylight. Yet these moss-troopers, if possibly they could procure the pardon for a condemned person of their company, would advance great sums out of the common stock, who, in such a case, cast in their lots amongst themselves, and all have one purse." The Lord William Howard mentioned by Fuller was "Belted Will" of Naworth, whose rigorous measures struck such terror amongst the moss-troopers, that "with his name the mothers stilled their babes," a use to which, according to Shakspeare, the French mothers applied the name of Lord Talbot, who rendered himself so dreaded in the wars with France.

In concluding this account of the Borders and their inhabitants in former days, we may remark, that the two most renowned of all the Paladins, Orlando and Rinaldo, were both border lords, and they are accordingly represented by the poets as possessing that union of courage and rapacity, begotten and fostered by their situation.

"Near a border frontier in the time of war
There's no'er a man but he's a freebooter."

LAST WORD OF THE SINGER.

(Conclusion.)

The physician, Lange, proposed that he should himself have the pleasure of accompanying the singer, when she should appear in public again, the first time after her illness: to this the signora most readily agreed. Doctor Lange had indeed, by his true kindness, his paternal care, won a claim to her warmest gratitude. They appeared together at the masquerade, and it seemed even to the doctor himself, while by the side of the fair and interesting girl, that he was a person of no small consequence. The people in B— were a strange set. At first every one, from the visitors in the highest and most fashionable drawing-rooms, down to the frequenters of the beer shops, had spoken ill of Bianetti; but, when men of consequence took her by the hand, when respectable dames publicly defended her, the weathercocks turned with the wind, and the inhabitants of B—, affected by the fate of the poor girl, ran about the streets almost dead with joy because she had recovered. When she entered the room, it seemed as if she had been waited for as the queen of the festival: people shouted,

clapped their hands, and cried "bravo!" just as they were wont to do when she had executed some difficult roulade. The doctor too came in for a share.

"Look! there he is!" they said; "that is the skilful physician who saved her life."

Giuseppa felt herself pleasingly affected by this applause of the crowd; indeed, she had almost forgotten, in the midst of so many whispered good wishes, that a more serious object had brought her to that place; but the four robust dominoes who followed her steps, and the questions of the doctor, "whether she had yet observed the grey eyes of the chevalier," kept her in remembrance of her purpose. It soon became evident to both the doctor and herself, that a tall, thin man, in the costume of a Turk (called in the city of B—, that of Ali Bassa) kept always near them; as often as the stream of masks forced him away, he returned again and again to their side. The singer made a sign to the doctor, looked significantly at the mask, and said—

"I have observed him for a long time."

The Turk approached with rather uncertain steps; the signora clung more closely to the arm of the physician; two grey eyes were now seen peering from out the mask, and a hollow voice said—

"I am delighted beyond measure, most excellent Mademoiselle, to see you in such desirable health."

The signora turned away in terror, and appeared to tremble; the mask likewise, seeing her draw back, disappeared among the crowd.

"Is it he?" asked the doctor; "compose yourself, for we must proceed quietly, and with much precaution. Do you think it is he?"

"I am not quite certain," she answered; "but I thought I recognised his eyes."

Dr. Lange gave the dominoes the hint to have their eyes on the Turkish mask, and went to another part of the room with the signora. Scarcely had they gone a few steps, when they saw the same figure, who seemed to be watching every movement of the singer.

The medicinalrath went into the banquetting-room with Giuseppa, as he thought she would be the better for some refreshment after her fright: he looked round; there was the Turk standing close by! The Pacha, who had now some sweetmeats and a glass of lemonade on a small plate, approached the singer: his eyes trembled; the glass seemed ready to fall, and made a sad noise on the shaking plate. He had now come close up to her, when he presented the plate, and said—

"Madam, would you not like a glass of lemonade and a few sweetmeats?"

Bianetti stared at him, became pale, pushed the plate from her, and cried—"Horrid man! It is he, it is he; he wishes to poison me."

The Pacha of Janina stood dumb and motionless; he seemed to give up all thought of defence, and quietly allowed himself to be led off by the four dominoes.

Almost at the same moment the doctor felt some one pull his black cloak with violence; he turned round, and saw the deformed little valet from the Hôtel de Portugal, standing beside him, pale, and evidently in extreme terror.

"For the love of God, sir, come with me directly to No. 53, before the devil drags away that French gentleman."

"What are you babbling about?" said the doctor, impatiently, seeking to push him aside, that he might follow the prisoner to the police station.

"I implore you," cried the dwarf, almost howling; "he may perhaps still be saved; you are the principal physician—indeed, the city doctor; and it is your duty to come and visit the strangers in the hotels."

The physician swallowed an expression of impatience and vexation he was on the point of uttering; he saw he had a duty to perform, however disagreeable it might be; he beckoned to the music director Boloni, gave Bianetti to his care, and quickly left the room.

Lange hastened with the valet to the Hôtel de Portugal. It was nearly midnight; all was still and desolate

in the large building; the lamps in the passages and in the staircases burned faintly and dimly, and the doctor experienced an uncomfortable sort of feeling stealing over him, as he ascended the steps to visit this lonely invalid. The valet threw open the door; the doctor entered, but almost felt inclined to go back; for a being whose form and appearance had haunted him continually both when asleep and when awake, now lay before him in reality. He was a tall thin elderly man, and had a high pointed woollen nightcap drawn far over his forehead: his contracted chest and his bony arms were clothed in flannel; from beneath the cap projected a large sharp nose, a haggard yellow face, which might have been that of a corpse, had it not been for the keen grey eyes, which gave him an appearance of life, and a most hideous fear-inspiring expression. His long thin fingers with their meagre joints were hanging far out of his sleeves, and with a hoarse delirious laugh he was twisting the coverlet of the bed.

Like this, precisely like this man, the doctor had conceived the Chevalier de Planto to be; those cunning grey eyes, those demonlike features, that withered form, all were here, just as the signora had described him. But might not another man have grey eyes? Was it to be wondered at if a sick person looked pale and ghastly? And had he not just come from the capture of the chevalier?

The doctor smiled to himself, drew his hand across his brow as if to banish such thoughts, and approached the bed. Yet in all his practice he had never experienced such fear and horror as now oppressed him, while he stood at the bed of this man; the shuddering which he felt was inexplicable to himself, and he in vain sought to free himself from it; he involuntarily drew back when he touched the damp cold hand, in order to feel the pulse.

"That stupid fellow," said the sick man, in a hollow voice, mixing French, bad Italian, and broken German together; "that stupid fellow has, I believe, brought me a doctor. You will pardon me, but I never had much faith in your art. The only thing which can cure me are the baths of Genoa; I have already told that villain to order post horses; I shall leave this place to-night."

"He will, indeed, leave this place," murmured the dwarf, "but with six coal-black horses, and not for Genoa, where the holy Fiesco drank, but to a much worse place."

The doctor saw that little could be done; he perceived the fearful approach of death in the eyes of the sick man; his restlessness and wish to be removed were all symptoms of a speedy close. He advised him to lie down and keep himself quiet, and promised to prepare for him a cooling draught.

The Frenchman laughed fiercely. "Lie! lie quietly down! Were I to lie down I should cease to breathe: I must sit up in the carriage, I must sit, and away, far away! What are you saying, fellow? Have you ordered the horses? Dog, have you packed my trunk?"

Dr. Lange took again the hand of the man. "Have confidence in me," he said; "my art may yet be able, by the blessing of Heaven, to do something for you. Your servant tells me that an old wound has broken out; will you permit me to examine it?"

Pointing to his side, the dying man grumblingly assented. The physician removed a badly-made bandage, and found—a dagger wound near the heart. Strange! it was the same size and of the same description as that of the singer.

"This is a fresh wound," said the doctor, looking at the sick man very suspiciously; "how did you get this?"

"You think perhaps that I stabbed myself! No; I had a knife in my breast pocket, fell down a stair, and scratched myself a little: that is all."

"Scratched himself a little!" thought Lange; "and yet he is dying from this wound!"

Meanwhile he had prepared some lemonade, and

offered it to the invalid, who carried it with an unsteady hand to his lips; it appeared to refresh him, and for a few moments he was calm and quiet. When he perceived that he had spilled a few drops on the coverlet, he began to curse and swear, and asked for a handkerchief. The valet ran to a small box, opened it, and took out one. The doctor looked at it—a fearful suspicion entered his mind—he looked again; it was of the same colour, the same sort of material, as the one found by the signora. The doctor shook in every limb; there was no longer a doubt. The Chevalier de Planto, the murderer of Bianetti, lay before him. It was a helpless, sick, dying man who lay there; but to the doctor it appeared as if every moment he might leap out of bed and seize him by the throat. He snatched up his hat, and hastily left the presence of the miserable being.

The terrified valet laid hold of him by the coat when he saw him going away.

"Ah, noble sir!" groaned he, "you surely will not leave me all alone with him. I cannot stand it; if he should now die, and then, as a flanneled ghost, with that pointed cap on its scull, walk up and down the room! For heaven's sake, do not leave me!"

The dying man grinned fearfully, laughing and cursing by turns; he seemed as if coming to the help of the dwarf: he stretched one long withered limb out of bed, and extended his bony fingers towards the doctor. The latter could stand this no longer; he threw off the desperate valet, and hurried out of the room. Even on the lowest steps of the house, he heard the horrible laugh of the assassin.

Next morning a handsome carriage stood before the door of the Hôtel de Portugal; three persons alighted from it, a veiled lady and two elderly gentlemen, who entered and immediately went up stairs.

"Is the referendary Pfälle above?" asked one of the gentlemen of the waiter who was attending them.

The latter answered in the affirmative, and the other continued—

"A most singular interposition of Providence, that he should fall down stairs, wound himself with his own dagger, so that he was prevented from getting away; and that you, Lange, should have been called to him!"

"Certainly," added the lady. "There was likewise a peculiar Providence in his leaving his handkerchief with me, and asking for another like it at the very time the doctor was beside him!"

"So it was to be!" said the second gentleman; "and nothing can be said on the subject but that so it was ordered. But in this whirlpool I had almost forgotten something: tell me, what have you done with the Pacha of Janina? The signora must surely have been mistaken. Have you set him at liberty? Who was the poor creature?"

"On the contrary," replied the other gentleman, "I have convinced myself that he is an accomplice of the chevalier. I have had my eye on him for some time past, and have commanded that he should be brought here, to confront him with the prisoner."

"Not possible!" exclaimed the lady; "an accomplice?"

"Yes, yes," said the gentleman, smiling slyly; "I know various things, though people do not choose to tell me them. But here we are at No. 53. Mademoiselle, have the kindness in the meanwhile to step into No. 54; the director Boloni permits it, and will not turn you out. I shall remain here; and when you are to be examined, I shall send for you."

It is not necessary to say that these three persons were the singer, the physician, and the inspector of police; they came to accuse the Chevalier de Planto of an attempt to murder. The physician and the official entered. The sick man was sitting up in bed, as the doctor had seen him the night before; but now, in the light of day, his features appeared more hideous—the expression of his eyes, which begun to be fixed, more awful. He looked,

first at the doctor, then at the police director, with vacant looks; then he seemed to be reflecting on what was passing around him. The referendary Pfälle had placed a table before him, laid on it a pile of paper, and held in his right hand a pen, ready to note down the evidence.

"Beast!" cried the invalid, "what do these gentlemen want? you know I receive no visitors."

The police functionary stood close to him, looked at him steadfastly, and said emphatically:

"Chevalier de Planto!"

"Qui vive?" replied the sick man, lifting his right hand to his cap, as if saluting him in military fashion.

"Sir, are you the Chevalier de Planto?" continued the other.

His grey eyes began to sparkle: he threw piercing glances upon the referendary and the inspector, scornfully shook his head, and replied:

"The chevalier has been dead some time."

"Indeed! who are you then? Answer me; I ask in the name of the king."

The Frenchman laughed. "I am called Lorier. Fellow, give these gentlemen my passport."

"It is not necessary. Do you know this handkerchief, sir?"

"Why should I not know it? You have taken it from my seat. Wherefore are all these questions? What is all this about? Gentlemen, you annoy me."

"Be pleased to look at your left hand," said the inspector, "there you will find your handkerchief; but this one was found in the house of a certain Giuseppa Bianetti."

The sick man cast a look of fury on those around him; he clenched his fist, ground his teeth, but remained doggedly silent, although the inspector repeated the question. The latter now gave the doctor a hint, who went out of the room, and soon returned with the singer, the director Boloni, and the ——— ambassador.

"Baron Martinow," said the inspector, turning towards that gentleman, "do you know this man to be the same person whom you knew in Paris as the Chevalier de Planto?"

"I recognise him to be the same," replied the Baron, "and again repeat the statements I made formerly, when called upon to give my deposition."

"Giuseppa Bianetti, do you know this individual to be the same person who took you from the house of your stepfather, who led you to his house in Paris, and who lately made an attempt on your life?"

The signora shuddered at the sight of the wretched being; she was going to reply, when he spared her by his own confession. He raised himself higher in his bed, his woollen cap seemed to stand up more pointedly, his arms were rigid, he appeared to move them with great difficulty, and his fingers bent convulsively; his voice came faintly and hoarsely from his breast, even his laugh and his oaths had sunk into a kind of whisper.

"Do you come to visit me, Schepperl?" he said.

"Well, that is kind of you. Are you not delighted with my appearance? I am truly sorry that I did not hit you better; you would then have been spared the pain of seeing your uncle insulted, before his departure, by these German brutes."

"What need have we of farther evidence?" observed the inspector. "Mr. Referendary Pfälle, make out a writ of imprisonment against——"

"What are you about?" exclaimed the doctor. "Death is already at his heart. He cannot live many hours. Make haste, if you have any more questions to ask; or rather go and send for a priest, if yet the wretched being may have time to confess his sins, and repent."

The inspector left the room. The dying man however appeared to sink more and more rapidly; his eyes became fixed; yet, as he turned them towards Giuseppa, rage and fury were still perceptible.

"Schepperl," he went on to say, "you have made me miserable; you have ruined me, and for that you deserve death. You have also ruined your father, and sent him to the galleys, because he sold you to me for gold; he entreated me to destroy you. I am sorry I trembled. Cursed be these hands, which did not at once strike surely!"

His frightful oaths, uttered against Giuseppa and himself, were interrupted by a message from the inspector, that Bianetti's presence was required in another apartment. There a singular sight presented itself. Two officers of justice led in a man attired as a Turk; it was the unfortunate Pacha of Janina; the turban covered the head of the sorrowful Counsellor Bolnau. All were astonished, and the music director seemed in a state of great excitement; he became red and pale by turns, and turned away his face.

With a most rueful countenance the Turk looked around him.

"I knew it would come to this," he began, in a melancholy tone. "I had long foreboded it. But, Mademoiselle Bianetti, how could you bring upon an innocent man so much misery?"

"What do you want with this gentleman?" asked the singer. "I do not know him. What has he done?"

"Signora," replied the inspector, gravely; "there should be no tampering with justice, nor forbearance shown to any one. You must know this gentleman: he is the Counsellor Bolnau. Your own waiting-maid declared that at the time of the accident she heard you call out his name."

"Dreadful!" exclaimed the Pacha, "to have my name mentioned in connexion with such suspicious circumstances!"

Giuseppa was amazed; a deep crimson suffused itself over her beautiful countenance; she seized the director by the hand in great emotion.

"Carlo!" she cried, "now you must speak; I cannot any longer keep silence. Yes, I may have uttered this name at that awful moment, yet I meant not this gentleman, but——"

"Me!" said the choir-master, stepping forward; "I am called not Carlo Boloni, but (if my dear father there permits it) Charles Bolnau!"

"Charles! musician! American!" exclaimed the counsellor, embracing him; "that is the first sensible word you have spoken in your life; you have rescued me from a great calamity."

"If the matter stands thus," said the man of justice, "you are at liberty; we have only now to deal with the Chevalier de Planto."

* * * * *

They returned to the sick-room. Here an awfully different scene was before them. The inspector approached the bed of the terrible being. There stood the doctor, in a solemn attitude, holding the hand of the murderer; he laid it slowly and quietly on the cover, and closing the fixed eyes—

"Inspector," said he, "now he stands before a higher Judge."

All understood him; and they quitted the apartment of the dead, filled with thoughts too awful to admit of farther conversation at that time.

The next meeting of the singer and the doctor, with the counsellor and his now restored son, was a happy one. The singer hid her face on the bosom of her lover, and wept; but these tears were the last she shed over the unhappy events of her life. The counsellor went smiling away from the affectionate pair, and seemed to have come to some great determination: he spoke aside to the doctor, and then returned to his son and the signora.

"Dearest young lady," he began, "I have suffered much on your account. You have mentioned my name under such sad circumstances, that I beg you will exchange yours for it. Yesterday you despised my offers of attention, will you push me away again when I pre-

sent to you Master Charles Bolnau, my musical son, and request you to accept him as your husband?"

Bianetti did not this time say, No; she kissed with tears of joy the hand of the counsellor. Charles folded her with rapture in his arms, and seemed for the present entirely to have forgotten his sublime speeches. Counsellor Bolnau grasped the hand of the physician.

"Lange," said he, "could I ever have fancied that it should lead to this, when you made me tremble in every limb, when you recounted the story of Bianetti's accident, and when you said to me her last word was Bolnau!"

"And what could have been better?" replied the doctor, smiling; "it was well I told you that, for who knows if all this would have happened, but for THE LAST WORD OF THE SINGER!"

POPULAR YEAR-BOOK.

(March 22 to 30.)

March 22d.—This day received the appellation of Mid-lent Sunday, because it is the fourth, or *middle* Sunday between Quadragesima, or the first Sunday in Lent, and Easter Sunday. It has also been called *Dominica Refectionis*, or the Sunday of Refreshment, probably from the Gospel for the day (St. John vi. 5), which treats of our blessed SAVIOUR'S miraculously feeding five thousand persons, and from the first lesson (Gen. xliii.) in the morning, which contains the relation of Joseph entertaining his brethren. It is also named *Rose Sunday*, because the Pope on this day carries a golden rose in his hand, which he exhibits on his way to and from the celebration of the Mass. *Mothering Sunday*, however, is the name by which it is popularly known, a term expressive of the ancient Catholic usage—practised by the faithful in each diocese—of visiting their mother or cathedral church, and making their voluntary offerings at the high altar. Although this custom (probably derived from the *Hilaria*, a festival celebrated by the old Romans, in the ides of March, in honour of the mother of the gods) has long been discontinued, we retain the ancient epistle for Mid-lent Sunday, which expressly alludes to Jerusalem, the *mother* of all Christian churches. The public processions formerly usual on this day, have ceased since the middle of the thirteenth century, and the contributions, above mentioned, have dwindled into the dues now known by the name of *Easter offerings*. It is still a usage on Mid-lent Sunday, in Monmouthshire, Cheshire, and some other parts of England, for servants and apprentices to visit their *natural* mother, instead of the mother *Church*, and present her with cakes, money, trinkets, or other small tokens of filial affection, and receive, in return, her blessing and a regule of firmity,⁽¹⁾ a porridge composed of whole grains of wheat boiled in milk, sugared and spiced, and sometimes mixed with currants and raisins. The following allusion to this usage in the seventeenth century occurs in Herrick's *Hesperides*:—

"I'll to thee a simnel bring
'Gainst thou go'st a-mothering,
So that, when she blesseth thee,
Half that blessing thou'lt give me."

"This mark of filial respect," says Brady, "has long since been abolished in the south, though another custom to which it gave way, of the landlords of public houses presenting messes of this nature to the families who regularly dealt with them, is much within the memory of many persons yet living."

On this day, in former times, the boys carried about the villages, with acclamation, a figure of *Death* made of straw, suspended on a pole. Some persons received this pageant kindly, and, after refreshing those who

(1) So called from the Latin word *Frumentum*, i.e. wheat. The connexion of firmity with Mid-lent Sunday, may arise from the mention of "Benjamin's Mess" in the first lesson in the morning.

brought it with milk, peas, &c., the usual diet of the season, sent it home again. Others, considering it a presage of coming evil, forcibly drove it away from their respective districts. Hone supposes that this "mawkin" "purported the death of winter," and was "only a part of another ceremony conducted by a larger number of boys, from whom the death-carriers were a detachment, and who consisted of a large assemblage carrying two figures to represent spring and winter." The author of the "Popish Kingdom" thus describes this pageant and its accessories, which, however, he asserts, was displayed on *Care*, or *Carle* Sunday, i.e. the fifth Sunday in Lent.

"The boys with ropes of straw doth frame an ugly monster here,
And call him Death, whom from the town, with proud and solemn cheer,
To hills and valleys they convey, and villages thereby,
From whence they straggling do return, well beaten commonly.
Thus children also bear, with spears, their cracknels round about,
And two they have, whereof the one is called Summer stout,
Apparelled all in green, and drest in youthful fine array;
The other Winter, clad in moss, with hair all hoar and gray;
These two together fight, of which the palm doth Summer get.
From hence to meat they go, and all with wine their whistles wet.
The other toys that in this time of holy fasts appear,
I lothe to tell, nor order like, is used every where."

The custom here described appears to have been only a variation of those before referred to. We learn from "Doblado's Letters," that, on this day, at Seville, there is a usage, evidently the remains of an old custom. Children, of all ranks, appear in the streets fantastically dressed, somewhat like English chimney sweepers on May-day, with caps of gilt and coloured paper, and coats made of the "crusade bulls" of the preceding year. During the whole day they make an incessant din, with drums and rattles, and cry, "Saw down the old woman." At midnight, parties of the commonalty parade the streets, knock at every door, repeat the same cries, and conclude by sawing in two the figure of an old woman representing Lent. This division is emblematical of Mid-lent.

In a sermon preached by the Dean of Canterbury, in the cathedral, on Mid-lent Sunday, 1808, he introduced the mention of a custom, in some parts of the country, of private families assembling in the house of the head or senior of their respective branches, and making it a day of innocent and cheerful festivity, upon the purest principles of religious and moral consideration; for the express and laudable purpose of consigning to oblivion, and thus happily terminating, all domestic differences; renewing and strengthening the ties of relative connexions, and impressing on their hearts and minds those important duties, on which the happiness of private life so essentially depends.

March 25th.—The Feast of the Annunciation, commonly called Lady Day.

Passion or Carle Sunday.

March 29th.—"This," says Bishop Sparrow, "is called *Passion Sunday*; for now begins the commemoration of the Passion of our Lord, and, after a long funeral pomp and train, the corpse follows on Good Friday." According to some writers, it was so named because certain rites peculiar to Good Friday were formerly solemnized on this day, to dispose the minds of the people to a due feeling for the sufferings of the Redeemer. Durandus says, that, on Passion Sunday, "the Church began her public grief, remembering the mystery of the Cross, the vinegar, the gall, the reed, and the spear."

Among the other old ceremonies of this day, soft hallowed beans were distributed, as a kind of dole, to denote this season of sorrow: a custom probably derived from paganism, and sanctified by the Church: offerings of that species of pulse having been considered by the heathens peculiarly propitious in appeasing the ghosts of the departed. It is possible, however, to cite a modern author, that there may have been no connexion

between the heathen funeral rite of giving beans, and the Church donation, if the latter was given in mere charity; for there was little else to bestow at such a time of the year, when dried pulse, variously cooked, must have been almost the only winter meal with the labourer, and a frequent one with his employer. An old writer attributes the practice to an imitation of the conduct of the Disciples, when they plucked the ears of corn, and rubbed them in their hands. "Instead of beans," says Brady, "our northern countrymen use peas in their repast of this day, especially in Northumberland: in some places they are first par-boiled, and then parched; in other districts they are only parched." Mr. Brand remarks, that at Newcastle-upon-Tyne, and many other places in the north of England, peas, after having been steeped a night in water, are fried with butter, given away and eaten, at a "kind of entertainment," on the Sunday preceding Palm Sunday. The peas so eaten were called *carlings*, and the mess seems to be identical with that alluded to in a Scottish song of the close of the 17th century:—

"There'll be all the lads and lasses
Set down in the midst of the ha',
The Sybows, and Rifarts, and *Carlings*,
That are both sodden and raw."

The day is still known by the name of *Care*, *Carl*, or *Caring* Sunday, in Durham, Northumberland, and the adjacent counties,—titles it once universally bore in England, though they are now no longer noticed in our kalendar. Why it is called *Care* Sunday is very uncertain. Brady affirms that it signifies "a day of especial care or devotional attention." The only attempt, says Hone, at the derivation of the word *care* is, that "the Friday on which Christ was crucified, is called in German both *Gute Freytag* and *Carr Freytag*;" and he thinks the inference is corroborated by the fact (above alluded to) of the Good-Friday ceremonies having been formerly used on this day. A writer in "Chambers' Edinburgh Journal" suggests that it took its name from the parched peas or carlings, and that the word *carling* "in time softened into *care*." "But how is it," inquires another author, "that *Care* Sunday is also called *Carl* Sunday, and *Carling* Sunday; and that the peas or beans of the day are called *carlings*? *Carle*, which now means a churl, or rude, boorish fellow, was anciently the term for a working countryman or labourer; and it is only altered in the spelling, without the slightest deviation in sense, from the old Saxon word *ceorl*, the name for a husbandman. The older denomination of the day, then, may not have been *care*, but *Carl* Sunday, from the benefactions to the *carles*, or *carlen*. These are still the northern names for the day; and the dialect in that part of the kingdom is nearer to Saxon etymology."

Mr. Nichols, in 1785, remarks that he had heard an old Nottinghamshire couplet, in the following words:—

"Care Sunday, care away;
Palm Sunday, and Easter Day."

"The vulgar," says Brand, "in the north of England, give the following names to the Sundays of Lent:—

'Tid, Mid, Misera,
Carling, Palm, Paste-egg-day.'

The first of the above lines is supposed to have been formed from the beginning of the psalms, *Te Deum*, *Mi Deus*, *Miserere mei*.

We learn from the last-cited authority, that in Yorkshire the rustics go to the public-house of the village on *Care* Sunday, and spend each their *carling* groat; i.e. that sum in drink, for the carlings are provided for them gratis: and a popular notion prevails there, that those who do not do this will be unsuccessful in their pursuits for the following year.

March 30th.—The memorable massacre of the French in Sicily, known by the name of the SICILIAN VESPERS, commenced at Palermo, on this day, 1282. The French had become hateful to the Sicilians, and a conspiracy

against Charles of Anjou was already ripe, when the following occurrence led to develop and accomplish it. On Easter Monday, the chief conspirators had assembled at Palermo, and while the French were engaged in festivities, a Sicilian bride happened to pass by with her train. She was observed by one Drochet, a Frenchman, who, advancing towards her, began to use her rudely, under pretence of searching for arms. A young Sicilian, exasperated at this affront, stabbed him with his own sword, and a tumult ensued; two hundred French were instantly murdered. The enraged populace now ran through the city, crying out, "Let the French die!" and, without distinction of rank, age, or sex, they slaughtered all of that nation they could find, to the number of eight thousand. Even such as had fled to the churches found no sanctuary there; the massacre became general throughout the island.

SKETCHES AMONG THE ALPS.

No. I.—EN ROUTE.

"SWITZERLAND again!" the reader will exclaim; "those everlasting Alps; are we never to have done with them?" Truly, it seems so, for descriptions continue so to abound of the mighty mountains, and the land they barricade, as almost to rival in number the travellers who gaze upon them. Pens and pencils are worn down in illustration of their wonders, till we might fancy description embodied in an avalanche of paper sufficient to overwhelm us. Without apology we add a few sheets more to the pile—principally to please ourselves—it may be to please others, or at least for an hour to cheat them out of the common occurrences of every-day life; make them turn aside from the monotony of its dull beaten track, and walk for a while amidst the sunshine of the grand and the beautiful.

Long had there flitted before us visions of the stupendous Alps; their bases fixed indeed on earth, but their magnificent heights towering as it were into the very heavens. In our imagination hovered pictures of valleys higher in surface than the mountains of other lands; and of lakes, wherein the lofty images of their mountainous protectors were shadowed forth in the rarest clearness and splendour. But these illusions, like the most graphic descriptions and the most artistic sketches, were as nothing to the sublime beauty of the reality, a reality which, the longer it was enjoyed, became only the more fascinating; which the more it was receded from, was only coveted the more; and in whose presence it was vain to attempt to deceive ourselves with the hope that absence would occasion indifference, when remembrance could alone be retained. It seemed then, as now, that those who behold this most scenic portion of Europe may afterwards wander where they will, but "never expect to look on the like again;" the attractions of other countries may recall, but can never efface, the delight and awe which is felt in traversing Switzerland.

As we are no poet, our present attempt may be considered presumptuous by those who maintain "that none but they who are poetical should describe scenery." Yet, since the land of Tell lacks not poets, its glories having been celebrated as much in verse as in prose, we are content to bear the odium, and indulge our prosaic mood.

From a height of two thousand feet above the sea level, the mighty walls of rock, the shooting summits of the proud bulwarks, were first apparent. During the ascent,

the view had been entirely cut off; but the height once gained, the superb scene had all the advantage of the deprivation in the contrast. How many have said of their first sight of the Alps, that such a sight was never to be forgotten! and how many have experienced, years afterwards, that memory, treacherous memory, could not, with its utmost efforts, recall anything like the same distinctness of vision, or depth of sensation, which were then, the one so clear, and the other so vivid; and are reminded how inadequate are the most minute details, or the most emphatic language, to do justice to the scene which once lay before them! The wide extent of mountains was still many miles distant, but their snowy sides glanced in the summer mid-day sun; masses of white clouds hung over their frost-bound pinnacles, somewhat obscuring the horizon there, while the sky overhead was of the most serene blue, in which the central planet moved on, its dazzling light reflected from the vast surface whose fair purity rivalled the effulgence which had travelled to meet it. We miss much in life for want of knowing where and how to look upon it; and thus might it then have fared with us, through an unprepared or transient glance at the Alps, had we not been aware of deceived vision, unaccustomed to gaze on snowy mountains, unused to look upwards to such airy heights, or downwards on such deep abysses; when cloud may be taken for mountain, and mountain for its fleecy attendant—for a moment. To the lengthened gaze the gigantic outlines belonging to earth became more distinct, and the bright reflection more dazzling, while the masses around were discovered to be poised in air; the huge cold solitudes, their peaks shrouded in their atmospheric veil, might be fancied as lost where no human eye could follow them, while their desolation beneath awed while it enchanted. Let no one look on them unless alone; the thrill of wonder and of delight is lost amidst society.

Some sagacious reader will here perhaps ask, how much of this wonderful Switzerland we could explore alone—alone without any one to help us? Could we climb Mont Blanc, or storm the Jungfrau? and what is the rest of the wild country to them? Jacques Balmont was nearly crazed when he set out to explore by himself; and, probably, if we heard a right account of the matter, so was the solitary chamois hunter, when he lost his road, and wandered to the top of the Jungfrau for want of knowing a nearer way home. Now we grant the truth of these observations, and further, that travellers who abide by steamboats and stage coaches, if they have money, can renew the fares when others cannot renew their frost-bitten feet or their snow-blinded eyes; moreover that, when danger must happen, it is a consolation to share it in company. The education of guides may be improved by making them speak in tongues foreign to them, and talking may possibly keep evil thoughts out of their heads, such as taking us prisoners, or tumbling us over a precipice. But, withal, we like not, amidst such sublime loneliness, the rumbling of carriage-wheels, or the chattering of the guide-machine, unconscious, seemingly, of the splendour around him, perhaps wearied of its daily recurrence, yet, in its absence, often becoming the despairing nostalgic patient, morbidly attracted to his mountainous parent without knowing why, except that the home was his.

In the descent we crossed a turbulent river by a covered bridge, whose roof was rude and strong; strong as was needed to resist the enormous pressure that at times found rest on it, and steep-sided was it to help the snowy fall. Entering a wide plain there arose before us the remains of some ancient Roman structures, telling of the death of man and the so-far life of his deeds; names are superfluous, for they are in every hand-book, labelled on every sketch. Next, on an imposing height stood an old and ruined castle, a time-worn relic of the middle ages, whose owners then were great,—as they are yet, but whose rule is now over another country. The outline of the dark and crumbling edifice stood

clearly out, the setting sun throwing his parting beams with power and brilliance upon its one side, while the whole of the solitary tower was distinctly defined against the cloudless sky; it stood in the deep repose which no living thing was there to break; solemn was the silence around it, still as the voices of those who once dwelt there, but were now passed away from that mouldering remnant of Helvetian feudality. There, from its commanding platform, centuries since jealous eyes had looked down on the extended plain beneath, and on its doubtful vassals; there imposing trains had passed through the portals to dazzle by their gorgeous pageantry, or to overawe by their stern and warlike array. The grey watchtower had a near companion, too, and years ago in its desertion, a fitting and a noble one; but the tenants of the latter are now the drivelling idiot and raving maniac; where the nun worshipped in "breathless adoration," amid the solitude of the cloister, the madman howls. On this spot was royalty, in the hour of death, deserted by its followers, and aided by a stranger—a female peasant, one who had perhaps trembled at the very name of the imperial ruler whom she then fearlessly assisted; and here, too, did the blind fury of feminine royalty scruple not to sacrifice a thousand of such peasant victims, to atone for the regal relative it had lost. Woman's nature in excitement often startles us; much of devotion followed the outburst, yet a stubborn priest thought that the penance had more to do with the head than with the heart.

As evening advanced the valley at whose termination we rested for the night, was long bathed in a flood of golden light, shone upon by a glow which might have streamed on paradise; while, however, its brightness, deep and rich as it was, allowed the sight to rest upon it in perfect repose, unlike the distraction of vision caused by the glare of noon. The flowing river, and the verdant plain, the mounted castle and the compact town beneath, glittered with radiance; it was a scene to rivet the eye of the observer for a far longer time than the scorching of the sun permitted him to enjoy; and as the darkness crept stealthily but inevitably on, regret could only be mitigated by the hope that some such other feast was yet in store. Each dawn in the transit through this varied country, brings before us a different view; yet we wonder at our departure from each, whether novelty can still abound, and we think, were but the ocean here, the eye would embrace perfection. We were now to be charmed with fertility in fields, vineyards and gardens, in this low part of Switzerland, where the valleys were neither guarded nor contrasted with the mighty elevations of the high Alps. We hastened through some places devoted to the bustling importance of traffic, fearful lest a picturesque ruin might be seen, reared up anew, for a location for steam, or some fairy spot beheld transmuted into the tortured producer of food.

An old inn was sought out, where no throng of guests beset the entrance, in whose neighbourhood, and within whose walls, complete repose might be expected, though in an age of luxury, amidst what must be called inconvenience to a considerable extent. The town rejoices at once in dismembered battlements and busy industry; therefore it is to be hoped, also in peace and plenty. Thanks to the ambition of the Roman Church, and the piety of its followers, the cathedral still towered in architectural majesty high above the town, the murmuring waters in its vicinity nearly the only object, except the old battlements, with which it might be supposed to have communion.

We had now skirted a lake, having little pretension to grandeur of scenery, but the whitewashed cottages on its shores brought England to our recollection. Perhaps no Swiss lake can be rightly called tame; yet tame this lake might be considered, when compared with the others. This was forgotten, however, when, through the trees that lined the road, were once more seen the white sides of the Alps, shining in the morning sunlight,

pure and lustrous, overtopping by thousands of feet the wooded hills that bounded the lake; scorning proximity to the haunts of men, whose fuel and food came from the humbler, though more friendly eminences at hand. What was the buzzing of machinery to their proud masses! impelled, though it were, by the streams they had created, then spurned, they condescended not to yield productions, to be squeezed, pinched, and wrought upon; but in stern defiance ranged afar and aloft, claiming kindred only with barrenness and unapproachability, waiting for Titans like themselves to tenant them.

There came through the clear air the sweet sound of a church bell, calling perhaps to the mid-day repast, perhaps to prayers; the tones were distinct and beautiful, while the long pauses between the strokes gave time for the music to dwell on the ear; heard thus, amidst silence and solitude, every object around in accordance with such harmony, we need not wonder that the old Catholics held their bells in reverence; to them, they were associated with life and death, joy and sorrow, with subjects of most interest in this world, and those of a future one.

The mountains on one side of the lake, rivalling the loftiest in our own country, were now dwarfishly reduced, and the lake had become like a river; a poor *char-a-banc* rattled past, swinging fearfully from side to side; it rushed down the steep descent, apparently all but upset, an event of perhaps no great moment in such a vehicle; down the slope it went, its pace far excelling the aristocratic and heavier carriages of the great highways.

A thickness came on in the atmosphere, which made the form of the mountains appear confused and diminished in height, though it had the effect of bringing them nearer to the observers.

A combination of perfections, it may be supposed, would weary us, and therefore it is seldom met with; if a bird has bright plumage, it has not song; if a woman is fair, she is often a fool; and no landscape exists, which has not some defect, or at least what we think such. The Right, on which we shortly afterwards stood, may appear in the mind of a poet as if intended for a standing place of easy ascent, from whence to look upon its greater neighbours, and therefore its homely form ought not to disappoint us; should it give way some day, like its opposite companion, we shall miss it; not so much, however, for its beauty, as its utility.

A DEVONSHIRE FAIRY TALE.¹

NEAR a Pixy field in this neighbourhood there lived, on a time, an old woman, who possessed a cottage and a very pretty garden, wherein she cultivated a most beautiful bed of tulips. The Pixies, it is said, so delighted in this spot, that they would carry their elfin babies thither, and sing them to rest. Often, at the dead hour of the night, a sweet lullaby was heard, and strains of the most melodious music would float in the air, that seemed to owe their origin to no other musicians than the beautiful tulips themselves; and whilst these flowers waved their heads to the evening breeze, it sometimes seemed as if they were marking time to their own singing. As soon as the elfin babies were lulled asleep by such melodies, the Pixies would return to the neighbouring field, and there commence dancing, making those rings on the green which showed, even to mortal eyes, what sort of gambols had occupied them during the night season. At the first dawn of light the watchful Pixies once more sought the tulips; and, though still invisible, they could be heard kissing and caressing their babies. The tulips, thus favoured, retained their beauty much longer than any other flowers

(1) From Mrs. Bray's "Description of the Part of Devonshire bordering on the Tamar and Tavy."

in the garden, whilst, though contrary to their nature, as the Pixies breathed over them, they became as fragrant as roses; and so delighted at all this was the old woman who possessed the garden, that she never suffered a single tulip to be plucked from its stem. At length, however, she died, and the heir who succeeded her destroyed the enchanted flowers, and converted the spot into a parsley-bed—a circumstance which so disappointed and offended the Pixies, that they caused it to wither away; and, indeed, for many years, nothing would grow in the beds of the whole garden. But these sprites, though eager in resenting an injury, were equally capable of returning a benefit; and, if they destroyed the produce of the good old woman's garden when it had fallen into unworthy hands, they tended the bed that wrapped her clay with affectionate solicitude, for they were heard lamenting, and singing sweet dirges, around her grave: nor did they neglect to pay this mournful tribute to her memory every night, before the moon was at the full; for then their high solemnity of dancing, singing, and rejoicing took place, to hail the queen of the night on completing her silver circle in the skies. No human hand ever tended the grave of the poor old woman, who had nurtured the tulip-bed for the delight of these elfin creatures; but no rank weed was ever seen to grow upon it, the sod was ever green, and the prettiest flowers would spring up without sowing or planting, and so they continued to do till it was supposed the mortal body was reduced to its original dust.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

COPERNICUS.

BY S. M.

THE Mountain church of Frauenburg
Hath many a narrow bed,
Where the oaken cross points upward
And peasants weep their dead;—
Stand we beside yon graven stone,
And veil the reverent brow,
And muse upon the mighty one
Whose body lies below.

Earth lay in darkness;—as a Star
He rose upon the night,
And outlines of the things that arc,
Shone dimly by his light.—
How dreamy seems the World's wild youth
To us of elder time,
Familiar with God's steadfast truth,
So simple—so sublime!

He first it was, whose piercing eye
Through the thick midnight saw,
In endless changes, Unity,
And in confusion, Law.
Though other hands unwound the clue
To realms of clearer day,
All honour to the First is due
Who pointed them the way.

He moved through Life, as one who hears,
And answers from within,
Faint music from celestial spheres
Through Earth's discordant din.
Well might he stand with brows inclined,
In silence and apart,—
A thought of the Creator's mind
Had passed into his heart!

What nights of happy toil were his,
Toil that itself repays,
Scanning creation's mysteries
With no irreverent gaze!
Oh, hour of hours, when first he seemed
To grasp the truth, long sought,
And the solitudes of starlight teemed
With multitudinous thought!

Strange is the destiny of Life,
Wondrous is Fame's behest,
Passing the labour and the strife—
Crowning the time of rest!
Long years of lonely watching o'er,
There came at last the hour,
When to the dying Sage, they bore¹
The Record of his power.

They would have kneeled around the place
Where, pale and faint, he lay,
But, silent, with unaltered face,
He motioned them away;
Earth's greatness vanished there, as snow
Melts from the summer sod—
His soul had done with time, and now
Stood face to face with God!

ST. DOROTHEA.

A LEGEND.

WHEN our bless'd Saviour Lord, to whom
Be glory for evermore!
Had suffer'd all his bitter doom,
In heathen days of yore;

In Greece there liv'd a gentle maid,
Who tended her garden bowers;
To whom our Lord his love display'd,
Among the trees and flowers.

She nurtur'd her garden, so fond, so kind,
With a gay and childlike joy;
And the faith was pure of her innocent mind,
As gold is without alloy.

And once, when in her garden shade,
In sleep the maid reclined,
The Lord a dream of bliss display'd
To her pure and holy mind!

That hallow'd vision of love was given
From the bright and the blissful land;
An angel came down from the gates of heaven,
With three roses in his hand!

He gave her the roses, with looks of love,
And he gave her a holy kiss;
Then he flew at once through the realms above,
Back to his home of bliss.

And as she awoke from this joyful rest,
She thought of that vision of heaven;
And she found three roses on her breast,
Which her angel love had given!

And her young heart glow'd beyond control,
To reach those bowers above;
And she praised the Lord in her inmost soul,
For the gifts of heavenly love!

And two days more the daylight woke,
And chased the midnight gloom,
And as soon as ever the third day broke,
The roses began to bloom!

On the fourth day the angel flew to her side,
As a bridegroom flies to his love;
And he bore the roses, and bore the bride,
To the bowers of bliss above!

Kürner.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

CHANNEL ISLANDS OYSTER FISHERIES.

THE English reader is aware that the British Channel is distinguished as the seat of a very extensive and lucrative oyster fishery. Connected as this fishery is with the island of Jersey, it forms one of the staple branches of its commerce. Fortunes have at former periods been made from success in this species of traffic, and the value of the annual exportation of oysters from Jersey is probably as great as from any other single fishery in the kingdom. Prestonpans, a small seaport in the vicinity of Edinburgh, is considered the principal oyster fishery in the British dominions. It is that locality whence come the famous Pandore oysters, which, from their peculiar shape and flavour, command a higher price than any other species brought to the London market. The oysters alluded to are rarely above two inches in diameter, and the clear transparent nature of their shell is a quality altogether peculiar to themselves. The oysters of Jersey, unlike those found on the eastern coast of Scotland, are remarkable for their magnitude. At full growth, their shells are seldom less than five inches in breadth. They are of a dark brown colour, and their rough and rugged appearance constitutes a general distinction, which, to the oyster dealer, is a never-failing characteristic in determining their place of breeding. It has become frequently a matter of inquiry what peculiar influences tend, through the course of time, to cause a departure from original generic identity. Fish of the same genus are to be found in a hundred different seas, but certain peculiarities which one possesses in opposition to another have warranted naturalists in classifying them under different species. The several sorts of oysters found in the different waters of the globe claim each the same generic origin; yet in size and general appearance they are all essentially different. The richest pearl in the tiara of royalty is extracted from the shell of the oyster inhabiting the Indian main; the oyster of the Pacific is sometimes not less than a foot in diameter; the Irish oyster is larger than the Scotch; and those found in the English Channel are considerably larger than either. To attempt to trace the circumstances to which all this difference is owing were fruitless, involved as these differences must be in physical circumstances, which even philosophy will probably never be able to unravel. First established at the period when the celebrated Sir Walter Rayleigh was governor of the island, the traffic in oysters for many years formed the staple commerce between this country and England. With the retirement, however, of that illustrious man, the trade so well began gradually dwindled away, and two centuries had been allowed to elapse before it began again to emerge into any sort of importance. The date of the revival of the fisheries may be assigned to about the year 1797. Situated as Jersey is, in almost immediate contiguity to France, the trade in oysters carried on in connexion with this island has always been subjected to not a little vexatious interference on the part of the latter country. The disputes which have from time to time occurred have given rise to various legislative enactments. In 1822, according to a stipulation entered into between the two countries, it was agreed that the French and English should have an exclusive right to fishing oysters to an extent of one league between water marks along their respective coasts, and the space intervening between these lines of demarcation to be enjoyed by both, but in the exclusive right of neither. This stipulation, however, was never properly adhered to, and in the year 1824 another was drawn up, which limited the approach of British fishermen to the coast of France to the distance

of three leagues. This latter resolution is the law which regulates differences between the fishermen of the two countries. Since its enactment, however, disputes have by no means lessened. A strong feeling of hostility still as formerly pervades both parties. Blood has not unfrequently been shed, and two boats' crews of opposing fishermen have only to meet together to cause a skirmish of sometimes even a deadly nature on the open sea. The larger portion of individuals engaged in the Jersey oyster fisheries are not natives of the island, but of England—chiefly from the coasts of Kent and Sussex. The season annually commences on the 1st of September, and finishes on the 1st of June. Vessels begin to arrive about the close of August, gradually increasing in number as the season waxes later. The real activity of the trade, however, is only to be witnessed between the months of February and May. Between these periods the weekly value of the exports to England is not less than 5,000*l.* sterling. It is only oysters, however, of a certain size, which are allowed to be thus exported. According to an act of the local legislature, no oyster can be brought to shore of a diameter less than two inches and a half. This enactment was passed with a view to prevent the beds being drained and ruined by the withdrawal of the younger oysters. The oysters, however, generally exported, are of a size immediately bordering upon the prescribed limits. When taken to England they are deposited in what are technically called "parks," along the coast of Essex and on the margin of the Thames. From these "parks" they are gradually withdrawn to the London market as occasion may require. The average price at which oysters are purchased from fishermen may be stated at about 3*s.* per tub, each tub containing three bushels. They are to be purchased in small quantities throughout the island at about the rate of 2*d.* per dozen. The harbour in which the oyster vessels rendezvous is that of Gorey, a small town situated on the eastern coast of the island. There are sometimes a fleet of not less than 500 sail to be witnessed at one time in quest of oysters, and upon a moderate calculation 3,000 individuals may be said to be employed in the busy season in this species of traffic.—*Jersey Newspaper*.

It has been said (and, with regard to one of them, with truth) that Tacitus and Machiavel, by their cold way of relating enormous crimes, have in some sort appeared not to disapprove them; that they seem a sort of professors of the art of tyranny; and that they corrupt the minds of their readers, by not expressing the detestation and horror that naturally belong to horrible and detestable proceedings.—*Burke*.

THE mixture of those things by speech which by nature are divided, is the mother of all error.—*Hooker*.

WHOEVER has the regulation of the associations of another from early infancy, is to a great degree the arbiter of his happiness or misery.—*Stewart*.

A good conscience is better than two witnesses—it will consume your grief as the sun dissolves ice. It is a spring when you are thirsty, a staff when you are weary—a screen when the sun burns you—a pillow in death.

THE RIVER TEES AND ITS POETICAL ASSOCIATIONS.

And last and least, but loveliest still,
Romantic Deepdale's slender rill.

SIR WALTER SCOTT. *Rokeby*.

THE scenery of this country is excelled in grandeur by that of other lands; yet, in variety of hill and dale and level ground, and in a peculiar sweetness of landscape effect, it stands unrivalled. The intermixture of wood and cultivation enriching our distant and widely extended views, the embellished and park-like

appearance of a large portion of the country, and the taste and elegance of our landscape gardening, cannot fail to strike the eye of a foreigner as great and peculiar beauties. Neither are we deficient in the wilder features of landscape. Our rivers, lakes, and mountains, are extremely varied and beautiful; and the haziness which often invests them, like a thin veil, sweetening their hues, and softening them into harmony, is another feature adding greatly to their charms, though not always considered as a desirable part of English scenery.

The beauty and variety of our rivers call for especial

notice. In different parts of their course many of them assume every character that can be desired by the lover of varied scenery. They are spreading, winding, or rapid, according to the nature and acclivity of their beds; and these often present sudden and numerous variations.

The river Tees, sung by the author of *Rokeby*, and by other poets, is, perhaps, one of the most romantic and lovely of English streams, on account of the great variety of moorlands and mountains through which it flows in the early part of its course; the delightful pastures traversed by it in the middle course; and the fine promontories and commanding scenery where it joins the ocean. The pen of the accomplished Gilpin has recorded some of the charming scenery of this river. Describing the forest of Langley-dale, or Tees-dale, which latter name it assumes from running along the banks of the Tees, he says: "When the woods of this forest were in perfection, they must have afforded a great variety of picturesque scenery; for the Tees is one of the most romantic rivers in England, and forms many a furious eddy, and many a foaming cascade, in its passage through the forest, particularly that celebrated cataract which, by way of eminence, is called 'The Fall of the Tees.'"

The Tees rises on the eastern side of the mountain of Crossfell in Cumberland. This mountain is nearly three thousand feet high, and forms the highest portion of the ridge called Crossfell, running northward in that county. The other great ridge to the south-west reaches a still greater elevation, the principal peak being that of the noble Skiddaw, 3166 feet above the level of the sea. Some accounts, however, make Crossfell the higher mountain of the two.

Crossfell is characterized as a mountain that is generally ten months buried in snow, and eleven in clouds. Being encompassed by other desolate and barren mountains, it retains the snow much longer than other British heights. Skiddaw, on the contrary, is surrounded by the most romantic and attractive scenery; and is, therefore, proclaimed in terms of the warmest admiration by travellers, while we seldom hear the praises of the more wild and desolate Crossfell; indeed, few persons like to encounter the dreary and wearisome ascent. One who took it many years since, thus described the immediate rise of the mountain itself, after a journey over what he calls "almost impervious wastes." "We were now so much environed with large and extended morasses, rocks, and mountains, that they exhibited a frightful appearance; not the vestige of a house, except some old *shielas*, where formerly the people had resorted, like the Asiatic Tartars, to graze their cattle in summer—a practice now disused. There were a few sheep, but no deer that we could see; and, notwithstanding the extraordinary drought, the water followed our horses' footsteps, for miles together. At the place called Bulman's Cleugh there are some lead works. When we had gradually ascended about three miles, through very broken morassy wastes, the mountains began to rise in three very formidable ascents, steep, and, like Mount Lebanon, piled one above another, with large and extensive plains to each of them, and loose, shivery stones on their brows, very troublesome to the horses, which we were now sometimes obliged to quit. This continued for two miles more, when we arrived at the summit of the highest, which forms a capacious plain of several hundred acres, if you reckon from the east ascent, but of such a barren soil that there was not a single leaf of grass, herb, or plant to be found." Other persons have found the ascent much less difficult than is here represented, and have seen the whole of the summit covered with moss of various kinds, intermixed with the mountain hair-grass, heath mat-grass, and mountain dock. These observations were made in August, when the snow had entirely disappeared; and, if so much of a gloomy character invested the mountain at that beautiful season of the year, we may easily suppose, that it must be a

bleak and dreary scene when wrapped in fogs and covered with snow. The Rev. Thomas Hartwell Horne, when tracing the beautiful scenery of the English lakes, seems to have given only a passing glance at Crossfell. He says: "As we proceeded towards Penrith, the bleak Crossfell arose to view in the distance on our right; a long ridge of mountains, 2,907 feet above the level of the sea, whose summits were covered with snow. From the force and direction in which the wind met us, we were informed that the *helm-wind* was then blowing down that fell and the adjoining Token-fell. We observed a thick cloud on the summit, covering it like a helmet (whence this phenomenon takes its name), and at some distance from it, in an opposite direction, a thick undulating mist, apparently more dense than those which usually rise from the lofty mountains of this country. These appearances, we were told, were certain indications of the existence of the *helm-wind*, which blows with tremendous fury."

Such is the birth-place of the Tees, which takes its rise on the eastern side of this mountain, traversing barren moors and wild scenery through the early part of its course, and receiving those lesser mountain-rills and rivulets which gradually augment its bulk and importance. For the first few miles of its course, it forms the boundary between Cumberland and Westmoreland. It is then joined by two *becks*, or smaller rivers, called Trout and Crook becks. At its junction with the latter it forms the southern boundary of Durham, separating it for a few miles from Westmoreland, and then from the North Riding of Yorkshire. The course of the river is at first tolerably direct; it flows through a narrow valley among the hills, and receives various tributary streams from the counties of which it marks the boundary. Among those on the Westmoreland and Yorkshire bank, the chief are the Maize, the Lune, and the Bolder; while, on the Durham side, the Harwood, in junction with the Langdon-beck, the Eitersgill, the Bowles, the Hadshope, and the Eglestone, are the principal.

At the junction of the Maize, or Mary's-beck, the waters of the Tees swell out into a kind of lake, called the Wheel, and then discharge themselves in the most beautiful cataracts which England can boast of. These are caused by a ridge of trap-rocks, across which the river flows at Caldron Snout, about three miles above the grand falls at High Force. The scenery in the vicinity of Caldron Snout is exceedingly wild and romantic, and a sensible tremor is communicated to the adjacent rocks by the rushing of the torrent, where "the maddened Tees with maniac fury foams." For several miles a succession of beautiful falls, and the most picturesque scenery, delight the eye of the tourist. Highly attractive is that part of the river where the waters—

"Still gathering, as they pour along,
A voice more loud, a rush more strong,"

hurry over another ridge of coarse-grained grey columnar basalt, which crosses the torrent, and causes the majestic fall, called High, or Mickel Force.

Speaking of the falls of this river, Surtees remarks on the different kinds of cataracts which may be observed in this country. He says: "High up the Tees, in this parish (Cotherston), but not till after it has become a considerable river, is one of the finest cataracts in the island, whose roar is audible long before it is perceptible to the eye. Its character is that of the falls of Aysgarth, but the scale is beyond comparison more magnificent, the projection much deeper, the mass of waters more entire, and equally precipitous. Cataracts in this country may be divided into two classes; first, the falls of considerable rivers, of which the expanse is necessarily grand, while the depth is seldom very great, because their course has ceased to be very precipitous before they acquire so great a bulk of water; the second consists of mountain torrents, of no ample dimensions, but precipitated down the abrupt and

often perpendicular chasms of glens and gullies, with a force, and to a depth, which amply compensate for their narrowness. Of the former kind, the falls of Aysgarth and Tees stand, perhaps, unrivalled in Britain. To the latter, which are far more numerous, may be referred the Welsh *pietils*, the forces of Cumberland, Westmoreland, and Richmondshire, as also those of Ambleside and Airedale, the singular fluid column of Hardraw, the falls of Fyers, and a hundred others in Scotland."

A few miles below High Force, and about three above the village of Middleton in Teesdale, the banks of the river are formed of similar rocks, which support a slight bridge composed of a plank two feet wide, with low handrails, suspended by iron chains across the river, which is here sixty-three feet wide. This apparently dangerous bridge has an elevation of fifty-six feet above the water; and its tremulous motion is such that few travellers are disposed to trust themselves on it, with an impetuous river rushing beneath their feet. The scenery near Winch Bridge is exceedingly picturesque. Waters boiling over a rocky channel; bold promontories extending on either side into the river, and giving a winding character to the stream; rich foliage occasionally fringing the banks in wild profusion, and relieving the bleak appearance of the rocks; a massive background of distant hills;—all these, blended and combined, with "a grace beyond the reach of art," make up the enchanting picture. Several of the glades of the Tees, and also the tributary streams, are distinguished by names that seem little accordant with their character. Some of these names were given by the Danes; and are thus noticed by Sir Walter Scott:—

"When Denmark's Raven soared on high,
Triumphant through Northumbrian sky,
Till, hovering near, her fatal croak
Bade Reged's Britons dread the yoke;
And the broad shadow of her wing
Blacken'd each cataract and spring;
Where Tees in tumult leaves his source,
Thundering o'er Caldron and High Force;
Beneath the shade the Northmen came,
Fix'd on each vale a Runic name,
Rear'd high their altars' rugged stone,
And gave their gods the land they won.
Then, Balder, one bleak garth was thine,
And one sweet brooklet's silver line;
And Woden's Croft did title gain,
From the stern Father of the Slain;
But to the Monarch of the Mace,
That held in fight the foremost place,
To Odin's son, and Sif's spouse,
Near Startforth high they paid their vows,
Remember'd Thor's victorious fame,
And gave the dell the Thunderer's name."

To these lines the following note is appended:—

"The heathen Danes have left several traces of their religion in the upper part of Teesdale. Balder-garth, which derives its name from the unfortunate son of Odin, is a tract of waste land on the very ridge of Stanmore; and a brook, which falls into the Tees near Barnard Castle, is named after the same deity. A field, upon the banks of the Tees, is also termed Woden's Croft, from the supreme deity of the Edda. Thorsgill is a beautiful little brook and dell, running up behind the ruins of Eglistone Abbey. Thor was the Hercules of the Scandinavian mythology, a dreaded giant-queller; and, in that capacity, the champion of the gods, and the defender of Asgard, the northern Olympus, against the frequent attacks of the inhabitants of Jotunheim. There is an old poem in the Edda of Sæmund, called the Song of Thrym, which turns upon the loss and recovery of the mace, or hammer, which was Thor's principal weapon, and on which much of his power seems to have depended. It may be read to great advantage in a version equally spirited and literal, among the miscellaneous translations and poems of the Hon. William Herbert."

SKETCH OF THE LIFE OF ST. LOUIS, KING OF FRANCE.

"The noblest and holiest of monarchs."

DR. ARNOLD. *Lecture on Modern History.*

"Perhaps the most eminent pattern of unswerving probity, and Christian strictness of conscience, that ever held the sceptre in any country."—HALLAM'S *Middle Ages*, vol. i. chap. i.

Among the multitude of ideas which we are wont to cherish from a very early age—ideas which, if not very formed and definite, are at least most real and important in their influence upon character—few hold a more prominent place than a belief in the spirit of Christian chivalry; that is to say, both in its actual existence and excellence. Knightly faith, and honour, and heroism, combining with whatever is truly great and noble in heathen example, the far loftier virtues which are inculcated by a purer faith, are to the young, for the most part, something more than day-dreams. The best among them commonly yearn to see some proofs of such a tone around them, even though its old forms of expression may have long since disappeared. But, as manhood comes onwards, the vision fades: either an examination of the records concerning days of chivalry has convinced them that the seeming gold was dross, and that fraud and violent wrong were the main characteristics of the period—they have been told by cold-hearted instructors, such as Sismondi,¹ that "*chivalry never existed, save in brilliant fictions*;" or really earnest and well-meaning, though mistaken, teachers have assured them that its temper is incompatible with the highest kind of character; or the tendencies of a material age have proved too strong for them, and they conclude that its hour, if it ever lived, has now gone by; or (worst and saddest cause) the loss of innocence in their own hearts has induced that miserable scepticism in the goodness of others, which almost invariably attends long-continued error of life and conduct, and the distrust in the purity of motive of all among the living, is soon transferred, or rather extended, to the memory of the dead. The "*glory and the dream*" are vanishing, while they are yet in youth:—

"At length the *Man* perceives it die away,
And fade into the light of common day."⁽³⁾

Now, it is not our present purpose to analyse these various forms of objection; indeed, the attempt to prove to some of those who urge them, that they stand upon insufficient grounds, were a task as hopeless as to convince a thorough match-maker of the reality of wedded love. We shall be content to express our firm conviction of the actual existence and excellence of a truly chivalrous spirit, and proceed to some notices of the character and conduct of one, whose life appears to us to afford irrefragable proof of the justice of our position.

Louis, afterwards the Ninth French Monarch of his name, and better known by the title of canonization which was given him after death, was born in the year of Grace 1214. His father, King Louis VIII., had subsequently three sons, (christened respectively

(1) The chief authorities for this article are the "*Life of St. Louis*, by his Seneschal, the Sire de Joinville;" the 20th volume of the "*Modern History*;" and Hallam's "*Middle Ages*" (vol. i.); Gibbon and Mosheim have likewise been referred to. With regard to the credibility of the first-mentioned, it may be useful to give the judgment of Hallam: "Joinville is a real witness, on whom, when we listen, it is impossible not to rely."

(2) *Hist. des Français*. Introduction, p. xxii. Quoted in the "*Broad Stone of Honour*," p. 86.

(3) Wordsworth.

Robert, Alphonse, and Charles), whose names appear again in history; but, he dying in the year 1226, Louis found himself, at the early age of twelve, the inheritor of one of the great kingdoms of Europe, with his mother, Blanche of Castile, as the regent. His position appeared far from enviable; for, although much had been achieved, both by his father and grandfather, towards consolidating the power of the crown, the feudal barons were still too influential and too ambitious to acquiesce quietly in the state of submission to which they had been reduced, and eagerly watched for opportunities of emancipating themselves from any semblance of subjection. In England, scarcely twenty years had passed since the great lords had compelled their sovereign to grant the famous Magna Charta; and Louis's contemporary, Henry III., had obtained pecuniary aid from his parliament on the sole condition of renewing it. But while the rulers of the two countries each dreaded the baronial influence in their own territories, they had been most ready to assist and support it in the dominions of their rivals; and the English king appears to have looked forward to the regaining, by this means, the French provinces which Philip Augustus had wrested from Richard and from John. A more apparently favourable opportunity for revolt could scarcely occur: a prince yet in boyhood, a woman holding the regency, and that woman, by reason of her foreign extraction, possessed of few friends on whom she could rely, and a foreign monarch, naturally believed to be intent upon re-acquiring lost domains, and therefore fostering dissension as a mean thereto. But the malcontents were utterly unprepared for the energetic conduct displayed by Blanche, who, if (as is reported by some historians) she were wanting in some feminine graces of character, and of a rather imperious disposition, bore evidently a high-toned mind, and was possessed of extraordinary ability and firmness. The unbounded respect always paid to her by her son, his assertion of the admirable nature of her precepts and example, and the results of the excellent education which she afforded him, ought to silence for ever the silly slanders which unscrupulous and vindictive opponents were but too ready to invent and circulate respecting her.

The barons were headed by Philip, Count of Boulogne, the king's uncle, to whom they wished to assign the crown. Among the most prominent were Peter de Dreux, Count of Brittany, in right of his wife; Tybalt, Count of Champagne; Raymond, Count of Toulouse; and his friend and ally, Berenger, Count of Provence. Peter de Dreux was anxious for entire independence; Raymond, to recover some lost lands; and Berenger acted from motives of friendship to Raymond. Joanna, the Countess of Flanders, joined the league, from personal hatred of the queen-regent, Blanche. One cannot but be struck with the utter absence of anything like principle in these rebellions of the feudal chieftains. It formed, however, a feature in their character which was but too often exhibited. Their final display of power in England furnishes a remarkable exemplification. It is notorious that, throughout the wars of the Roses, nothing was more common than for a nobleman, on grounds of mere private pique or personal ambition, to shift sides with the whole of his retainers; and this without consideration of the justice of either cause, and little loss of confidence or respect among his new allies, or degradation in public opinion generally.

For a time the king and his mother were afraid to leave Montleheri, where they were quartered, and return to Paris. But their rightful claims seem to have been popular among the poorer classes, who everywhere invoked blessings upon the head of Louis, even though they might not always dare to resist the martial force of the great lords. The queen-regent found means of treating with several of the malcontents, and cleverly frustrated the ambitious designs of the Countess of Flanders, by giving liberty to her husband the earl, at a time when his lady was attempting to get the marriage dissolved, in order that she might wed the Count of Brittany, who had become a widower. The generosity of Blanche, as contrasted with his wife's want of affection, secured his services on the royal side for the future. The clergy likewise came to their support with a large subsidy; and two fresh plots to seize the king's person failed, in consequence of the conversion of Tybalt of Champagne, who informed them of the one, and came unexpectedly to the succour of Louis on the second occasion. The lords were thus for a time repelled; and one of their body, the Count of Toulouse, made ample submission, giving his daughter, whom he made his sole heiress, to the king's brother in marriage, while the Count of Brittany resigned the provinces of Anjou and of Perche.

But Tybalt had thus made himself an object of great dislike to his brother peers; and their attempted mode of revenge affords a curious picture of the times. It occurred to Tybalt's enemies, apparently for the first time, that the count's first cousin, the Queen of Cyprus (who was the daughter of an elder brother of Tybalt's father), was the true inheritor of his estates. But the lord of Champagne was too great a personage to be rashly driven away, finally and hopelessly, from their alliance; and they made one more effort to regain him to their side, by planning a matrimonial alliance between him and the daughter of the Count of Brittany. The time of the contemplated marriage was even fixed, when the king, hearing of it, despatched a hasty message to Tybalt, expressing a hope that he would never become the son-in-law of one who had so grievously offended his sovereign, as the Count of Brittany. How this announcement affected the inmost feelings of the betrothed parties does not appear, but Tybalt paid attention to the wishes of Louis, and annulled the match. The lords were furious: they sent for the Queen of Cyprus, and entered with armed forces into Brie and Champagne. The Duke of Burgundy brought assistance from other quarters, and they attempted to take Troyes. The king advanced to meet them; and sad ravage ensued on all sides. Resentment, however, was directed mainly against Tybalt; and the leaders of the opposed confederacy actually besought the king not to expose himself to the dangers of a battle, but to leave them to settle their own disputes. But Louis was far too brave a soldier, and too firm a friend, to listen to such proposals; and either his resolution in preparing for fight intimidated his adversaries, or a growing respect for his character made them shrink from actual combat. Negotiation ensued; and Tybalt agreed to give the Queen of Cyprus land to a large amount, and a still greater sum in money. Since, however, the pecuniary restitution was made by the sale of many of the districts which he governed to the king, the crown gained fresh power and influence from the transaction.

From this time the spirit of resistance, though unsubdued, became less violent; and, in a time of comparative tranquillity, Blanche married the young monarch to Margaret, daughter of Raymond, Count of Provence, and sister to the queen of our Henry III. She was a virtuous and affectionate princess, and followed her husband through much distress and danger. In the course of the ensuing year (A.D. 1234), the Count of Brittany, who had vainly sought aid from England, was completely humbled, and presented himself to the king with a halter round his neck. Tybalt, who, in right of

his mother, had become king of Navarre, changed his tone, and sought to regain by factious means the lands which he had sold to the Crown, but shared a similar fate; and first set the example to his peers of assuming the Cross, and departing for the Holy Land.

For some years the land enjoyed a great degree of quiet; but the same nobles, on their return from Syria, commenced fresh plots in conjunction with the Count of Toulouse. Henry III. of England, attempted some succour; but partly from the difficulty of gaining supplies from his parliament, and partly from disgust at the inefficient support given to plans by the French lords, soon retired from the confederacy, which was twice defeated by St. Louis, and thus compelled to leave the sovereign undisputed master of the field.

Louis had now become as powerful a monarch as, perhaps, had ever occupied the throne of France; and the edicts which, with the consent of his parliament, he now promulgated, all tended to consolidate his authority and secure him against fresh revolts. Alliances between the noble families and foreigners had already been forbidden; and he now compelled all, who were vassals of himself and the king of England, to make their election once and for ever as to which ruler they would serve. Both these laws had the effect of diminishing foreign influence in France, but they were certainly just and salutary, and there was always moral weight attending the king's enactments, because he never seems to have promulgated them with a view to mere selfish aggrandisement. They were necessary for the security of the crown, the quiet of the country, and the happiness of his people; but when the nobles complained, that, by this compulsory choice, they were sure to lose their estates in one country or the other, he indemnified, as far as possible, the loss. True that the funds arose partly out of the lands resigned by those who adhered to England; but this was previously arranged, and Henry III. had it equally in his power to reward his vassals, if it pleased him.

And now, before we arrive at the second great epoch of the life of Louis, it may prove some relief from the tedium of these details, to mention a few particulars (which are furnished by Joinville) concerning his private life. Both in words and in actions he set the best of examples to those beneath him. No temptation could induce him to depart from truth, or break his word; he spoke ill of none; and love of his Maker, and horror of sin, seemed alike deeply seated in his heart. "*Leprosy*," said he, on one occasion, to his biographer, "*would at least depart with life; but who could say if a man had so repented of mortal sin as to obtain God's pardon?*" He did not order delicacies for meals, but took whatever came; and drank a very limited quantity of wine. He daily attended the church services; and had private prayer with a single chaplain. He was much struck by a sermon, wherein the preacher showed that the kings who are recorded in holy Scripture, as having lost their crowns and territories, had been deficient in justice; and did everything in his power to cultivate that habit. In all dangers he displayed the most noble reliance on Providence; and towards his brother monarch of England, who had shown every disposition to take advantage of his difficulties, he felt no ill-will; and was willing to forego even just claims, because they had married sisters. The psalm, "*Ad te, Domine, levavi animam meam*" (the 25th), which was chanted at his coronation, expressed, says Joinville, the feelings of his heart towards Him who guarded and blessed his reign.

His court, (continues the same authority,) was admirably managed. The king and his guests dined in halls resembling cloisters, which had been built by one of the English Henrys; the high peers joining their liege lord at one table, the bishops and archbishops sitting at another, and the queen-mother, Blanche, at a third, served by the count of Boulogne and other noblemen. The meeting here referred to, took place upon the Feast of St. John.

Having mentioned some of the king's great merits, it would be unfair to omit all notice of what are commonly considered the defects in his character. That any man professing Christianity, can mean *seriously* to condemn him for habits of self-mortification by fasting and abstemiousness, we can hardly imagine, and with those who treat such a subject otherwise than seriously we can have no wish to argue. But a more solemn charge must not be passed in silence—we mean that of intolerance. It must indeed be confessed, that he believed it a duty to exterminate all enemies of the Christian faith, and, in common with his age, considered that the right of punishing opponents of the truth by the civil power, which appears to have existed under the Patriarchal and Judaic dispensations,¹ appertained also to Christian governments. Upon this question we will not enter; but dismiss it with two considerations. Firstly, that whereas anything like persecution *on principle*, however shocking and painful to our feelings, does at least show faith in him who exercises it, and a conviction of the truth of the creed which he professes, it may well be doubted whether those are in a position to condemn such, who have themselves no faith, who disbelieve in the very existence of objective truth, and regard all views with equal favour. Secondly, that the legitimacy of such proceeding, (impotent as it has appeared to prove, whether to resist the spread of truth or error,) was admitted by all the best and wisest men of Louis's age, and of some succeeding centuries, including both the British and Continental Reformers. Should it be urged that to mention this is only shifting the blame from King Louis to his times, then, be it remembered, that we are not undertaking a general defence of those ages. Our present object is merely to point out, that if they exhibited many forms of evil, (and even this narrative has already shown something of their selfish turbulence,) they were yet capable of throwing up plants of no ordinary beauty and vigour; that if what was bad in them was *very* bad, that which was good was *very* good; and this view is indeed no more than that which is advocated even by M. Guizot;² who, while he convicts the feudal ages of failure, so far as regards public rule and order, yet declares that they exercised a vast and salutary influence in the development of individual character, producing noble sentiments and generous actions.

Not long after the last-mentioned events, the king fell extremely ill, insomuch that he was given up for dead. On recovering speech, he asked for the cross, and, receiving it from the Archbishop of Paris, vowed to make a crusade in person. This resolution much afflicted his mother, who asserted that she would as lief behold him dead. But remonstrance, whether from her or his ministers, was in vain; he would on no account forego a course of action to which he had so solemnly pledged himself, although he readily consented to use every possible precaution, whereby the expedition might be rendered less prejudicial to his dominions, than had been those of his predecessors on the throne.

And this would naturally lead to some review of the character and effect of the Crusades. But this is a theme, which we desire to leave untouched. It is sufficient for our purpose to remark, that they had, whether rightly or wrongly, been countenanced by men of unquestionable excellence, whose examples King Louis was thus following.

But whatever be thought concerning the justice or prudence of the expedition itself, the mode of preparation cannot but excite our admiration. "Never," says one author, "was so imprudent a design so prudently conducted." The king's address in gaining the consent of the nobility, and persuading even some of the most turbulent to accompany him, was very great: and, with the pope's consent, he received from the clergy a tithe

(1) Job xxxi. 28; 2 Kings xxiii. 20; &c. &c.

(2) Hist. de la Civilisation en Europe, Leçon IV.

of their revenues. He was likewise fortunate in obtaining for his brother, Charles of Anjou, the hand of a younger sister of his queen, Beatrice, daughter of the count of Provence. She had been left heiress of her father's property, to the prejudice of her elder sisters, and was, consequently, much sought. Louis had not, however, travelled southward with a selfish end in view, but in the hope of terminating the fierce disputes carried on between the emperor of Germany (Frederick II.) and the bishop of Rome, (Pope Innocent IV.) though in this he was frustrated. By this match the district of Provence ultimately became the property of the crown. This unworthy brother, as he afterwards proved, subsequently became king of the Two Sicilies, and played a most important part on the theatre of Italian politics.

These are exemplifications of skill and clever policy on the part of Louis, which may incline us to doubt whether his abilities have not been slightly underrated by some historians, although none would claim for him the prerogative of high genius. But it was not by mere good sense and able worldly management that Louis prepared for his crusade. His course of proceeding calls to mind the noble language placed by Shakspeare in the mouth of Henry the Fifth—"Therefore should every soldier in the wars do as every sick man in his bed, wash every mote out of his conscience: and dying so, death is to him advantage; or not dying, the time was blessedly lost, wherein such preparation was gained." He made proclamation of restitution to all who had just claim, of redress to any whom he had wronged; and when Henry III. of England sent over his brother to demand, on this plea, the restoration of Normandy, he did not refuse without first putting it as a case of conscience to the bishops of that province, who declared that he was in no wise bound to deliver it.

N. N. E.

(To be continued.)

THE THREE MEETINGS.

We have been so often told that the improbable is not always the untrue, that we may be sometimes too prone to credit even the impossible. However this may be, what we are about to relate is strictly true as to circumstances; we have altered the names of places and persons, and no farther has our inventive faculty stretched. Occurrences that seem the most common, when viewed with the hasty eye that looks not through the telescopic mind, are frequently, when earnestly examined, rife with uncommon purposes and effects. We pass lightly over events which the future will show us to have been crowded with influences—evil or benign—destined to sway the lives of ourselves or others; and in the thick walks of the world, we are thrown upon persons in whom we take an interest we know not why—whom we encounter seldom, but always at some juncture marked by peculiarity of circumstance,—and we go on blindly, never asking ourselves *why* these chances have occurred. *Chances* we miscall them, and as such deal with them—ignorant in our nomenclature, and dim-sighted in our classification. Thus hath it ever been: man alters not as the earth he treads alters; our creeds are still fallacies, our waking life still pregnant with dreams. The present, like the past, passes in alternations of joy and sorrow, pride and shame, hope and disappointment. Wisdom is still a word in men's mouths, truth still a treasure in its deep well, life still flies fast to death, and the same dim shadow falls from the shape of futurity on our paths!

Three times only was it my lot to meet with the lovely woman who is the heroine of my brief sketch. It was a day bright with the flashing sunbeams of June; nothing could surpass the serene beauty of the all but Italian skies; and the sea of Dover looked like a huge and speckless mirror, stretching from British cliff to Gallic

strand, one mass of pure crystal. Yet the scene wanted not life; parties were promenading all about, catching the summer air; numberless vessels, from the vast trader laden with merchandize to the humble craft of the fisherman, were visible; and, on the picturesque heights commanding the town, military pageantries were going on; while, from the artillery fort, a salute was firing, announcing the arrival from Ostend of some foreign potentate. On the eastward cliff, which soared majestically over the sea, arose the castle, looking, what indeed it is, a noble specimen of the architectural powers of our ancestors.

As I stood on the beach, studying the animated beauty of the scene, I beheld a pleasure-barge approach the shore; it was full of gay faces and merry voices; laughter and mirth were there; but, conspicuous amongst the party of young and fair who filled it, was one lovely creature, whose image struck upon me like the vivid memory of some bright phantom of former dreams. As she stood up, the only one who stood, her light summer bonnet flung carelessly back, her long dark hair waving about her fair neck and glorious bust, her black eyes raining joyous influences all around, I know not how it was, or whence the accident sprung, but a sudden movement of the boat overbalanced her, and ere one could tell two, or say "twas done," she was overboard and in the water! A gentleman of distinguished appearance stood near me; in a moment he was struggling with the waves, and before the countless myriads who gazed on the scene could express their terrors or tender their assistance, he had borne her vigorously and unaided to the shore. She had not even fainted; though terrified and speechless, animation had not deserted her; and hurriedly, but safely, she was conveyed away.

"Who is she!" said I, accosting the nearest bystander. "Miss Singleton, the rich heiress of Whitfield," was the reply. "The gentleman, who has assuredly saved her life, is Lord Eythorne, the most extravagant man of fashion of the day; a fine, generous fellow, too, but a determined gambler. Report alleges that the young lady has already twice rejected his addresses; gratitude may now induce her to be less severe."

My informant was right; not many weeks thereafter, they were united; and the enormous wealth of the beautiful heiress was right acceptable to the handsome but needy and dissipated nobleman.

* * * * *

Two years passed away, and I was in London. The winter had come on suddenly and sullenly—

"Bitter cold it was,
The owl, for all his feathers, was a-cold!"

Snow had fallen for several days; the streets were dark, dirty, and dangerous; all things looked wretched and filthy—as all things invariably do in the metropolis at such seasons; but, though the voice of the furnishing beggar was heard clamouring in the nocturnal streets—though destitution, and despair, and vice walked abroad—the former twain too often causing the latter—fashion and pomp held their continued revels in courtly halls and gorgeous saloons.

I had been invited to a party at the mansion of one of the leaders of fashion, and I dared not neglect the invitation; which, however, I would fain have done, but for a consideration that need not be thrust upon the reader's attention. Slowly and reluctantly I left my little room, *au second*; and, betaking myself to a cab, whose *mauvaise odeur* of what a modern farce-writer calls "ingans and grigs," totally overwhelmed the "*Fantaisie de Rachel*" with which I had scented myself, I ordered the vehicle to be driven to Eaton Square. The rooms were crowded, for it was late when I entered. After passing some time in lounging about, speaking to the few whom I knew, and looking at the many to whom I was unknown, I retired to a corner ottoman, the only occupant of whose downy cushions was an elderly gentleman, who appeared as willing as myself to remain a silent observer of the surrounding gaiety. Behind us, in the embrasure

of a large window, and nearly shrouded from us by drapery, was a seat, whence to our ears came the sounds of three female voices.

"Who is the lady who persisted in making over Lord Eythorne (I started at the name) to the tender mercies of her gigantic '*esposo*,' as she called him, at the card-table?"

"Oh! it is that terrible, fussy Lady Nightshade," was the answer, in a voice so rich, so soft, that the tones trickled on my ears like music.

"Sir Simon Nightshade is the most inveterate gamester about town," growled a gruff-speaking dame, whose thin, precise, sharp features, were the only ones of the trio that were distinguishable from our seat. "Very few escape the avaricious and expert baronet's clutches; his poor wife always looks as if she had mislaid her mind, and was engaged in a perpetual search for it."

"I am sure George will not play deeply to-night," said the same sweet voice; "he has *promised* me, and he—he was very unwillingly led away by Lady Nightshade."

"*Promised! unwilling!* ha, ha, ha! my dear madam, by this time you should know at what rate to estimate such promises," said the angular lady; "besides, Lord Eythorne is never loth to join a card-table, and his powers of resistance did not appear to be very strenuously exerted."

A sigh escaped from the sweet-voiced lady. "I wish he would come," said she, almost in a whisper.

A short peevish laugh *trotted* out of her tormentor's thin lips, as she exclaimed, "It is quite time, dear Lady Eythorne, for you to resign your husband to clubs and cards, and every other possible or impossible coterie, where wives are forgotten or neglected."

"My dear Miss Sowerby," interfered the third lady, "do not alarm Lady Eythorne; her husband is just like other husbands, and *you* can know nothing of what we wives endure."

"I assure you," grumbled Miss Sowerby, "that I have no inclination to know either what Lady Eythorne's, or any other lady's husband, can do in the way of creating sorrow. I confess I do not know the temptation that could induce me to become a wife."

A silence ensued, when the old gentleman beside me, eyeing me closely, and perceiving that, like himself, I was a listener, said, *sotto voce*—"Miss Sowerby is on the verge of fifty, and has been accused of offering herself and her two thousand per annum to more than one man, Lord Eythorne included, whom she used to pester so unconscionably with all sorts of *petits soins*, that he was fairly obliged to insult her; since when she has been most bitter in her attacks on him and his lovely wife; for no enemies are so severe against us as those who have formerly been our warmest admirers."

"Lady Eythorne, then," cried I, "is the *ci-devant* Miss Singleton, of Whitfield?"

"Alas, yes, sweet lady," was the reply.

"And is she not, then, happy? Is her husband still the gambler he was before marriage?"

"I am sorry to say that neither is she happy, nor he reformed; yet I do not believe that he loves her the less, and he treats her kindly; but this sad passion for play defies all control. He is a ruined man; and unfortunately his wife's wealth, which no judicious management made solely her own, has been swallowed up by the same insatiable vice that has engulfed his own limited property. But hush!"

As he ceased, the party behind us arose; and, just as they passed, Lady Eythorne turned her face towards us, and for the second time in my life I saw her. Dazzlingly beautiful in her advance into womanhood had she grown; tastefully appraised, no dress could render more distinguished a loveliness unsurpassed. But yet there was a shadow on that fair brow—the careless glee of happy maidenhood had passed away, and in its place were the artificial smiles which the world teaches its votaries to

put on, to cover the secret sadness of the heart. Her figure was larger, and gave promise of future maternity; while there was a noble grace in every movement, that formed a striking contrast with the light and lively attitudes of the heiress of Whitfield, two short years before. As she drew near, my companion arose; when, recognizing him, she advanced towards him, holding out her hand.

"Ah, dear Doctor Percival, is it you? Pray lead me to the card-room. I wish to go home, and George promised to accompany me."

I followed them. Deep in the (to me) perfectly recondite mysteries of some fascinating game, whose very name I knew not, I observed the handsome Lord Eythorne. So intently occupied seemed the whole party, that the few intruders who entered that room were wholly unnoticed. Lady Eythorne approached her husband's chair, and she saw at a glance—what was in truth visible to less interested observers—that he had lost, and was still losing. Once she placed her hand gently upon his shoulder, when, turning round almost fiercely, and perceiving who it was, he gave a short, nervous laugh, and told her to go away, for he would soon join her. Presently, however, some disturbance took place among the players. Lord Eythorne, starting up, declared he was "*ruined*," and would play no more. The party was broken up, and all was confusion.

"Lead me to the carriage, George," whispered Lady Eythorne, as she seized her husband's arm. "Did you not promise me not to play to-night?"

A savage oath escaped him as he replied, "Do you not see that we are observed? No lecturing here, I beseech you."

She made no reply. Whether it was that words of unkindness, coupled too with an oath, were so new to her as to overcome her, or whether some sudden indisposition incidental to her situation, and accelerated by confusion and circumstance, caused the accident, I cannot tell,—but I saw her shiver violently; and had not Dr. Percival darted forward to render assistance, she would have fallen on the floor. She *did* faint, this time!

* * * * *

I left London for Paris, a few weeks after the incident I have just narrated had taken place; but previously to my departure I learnt that such was the embarrassment of Lord Eythorne's affairs, that both he and his lady had retired to the Continent. I had been a month in Paris; it was a cold and disagreeable night in March, when, returning home to my apartments in the Rue Louis le Grand, I became entangled in one of the narrowest and darkest streets of the Palais Royal, and suddenly came upon a group of people, who were collected before the door of a large gloomy house. A plaintive voice, whose tones sounded familiar to me, was appealing piteously to the *concierge* for admittance, which he in vain assured her he dared not grant; and no sooner did I perceive that among the numbers who crowded around her there was not one who stood her protector, than I made a step forward, demanding at the same time of a woman who stood near me, if she could tell me the nature of the case.

"Elle est folle, la pauvre,"¹ said the woman; "this is a gambling-house, and she declares that her husband is detained there against his consent."

"But there are no gambling-houses in these days?"

"No *public* ones, Monsieur—*mais*—"

"Let me go in, I implore you," interrupted again the melancholy voice of the suppliant; "let me save my husband!"

That voice—I could not be mistaken. I stepped forward, and beheld, indeed, Lady Eythorne. She looked wild, wan, and haggard; her tall form was shrouded in a large shawl, which concealed the outlines of her shape; but a sad change had already been worked on her countenance. Advancing to her, and accosting her in English, I told

(1) "She is mad, poor thing!"

her who I was, and entreated her to put herself under my protection. With a look of speechless thankfulness she unhesitatingly placed her arm within mine, but, before I had time to reflect what course to pursue, a loud noise from the interior of the house reached us; and, soon after, the door was forced open, revealing to us a ghastly figure, from whose head and neck streamed a current of blood. Rushing, or rather staggering, down the steps that led to where the concierge stood, he fell at the feet of Lady Eythorne; but one glance sufficed to assure that unfortunate creature that the being who lay lifeless before her was her husband!

Brief and hasty details must wind up this sad narrative. Police officials were soon upon the alert about us; seizures were made of desperate criminals; and loaded dice, with every other auxiliary of fraud resorted to by the infamous, were discovered. Lord Eythorne and his wife were conveyed to their hotel; and it was ascertained that the infatuated dupe of systematic villany, after losing large sums, had detected unfair play in his opponent, accusing him of the same in loud and opprobrious language. A blow succeeded,—and unarmed, at the mercy of his assailants, he was severely wounded, ere, forcing his way to the door, he burst it open, and fell senseless, but not dead, at the very feet of his hapless wife, who had followed him unobserved to the squalid precincts of the *maison de jeu*.

Of Lord Eythorne's future career time only can tell the tale; but I had seen the unfortunate Heiress of Whitfield for the third and last time. The newspapers of the following week detailed the sudden death of the beautiful Anne, Lady Eythorne, after a premature *accouchement*!

C. C.

ON THE RING MONEY OF THE CELTÆ,

AND THE USE OF OUR TROY WEIGHT BY THAT PEOPLE.

WE have the testimony of Cæsar, that, when his victorious legions invaded Britain, they found the island populous; that the inhabitants had good houses, an abundance of cattle, and large ships, with which they traded to Gaul, Spain, and Germany; and that they had for money "gold and iron rings of a regulated weight." The great abundance of gold found by Cæsar in Gaul absolutely diminished its value in Italy; and in Britain and Ireland many specimens have been found of torques, chains, and breastplates of that metal. In the latter country especially, the amount of articles of manufactured gold dug up in the course of twelve months, is surprising. The surface of the earth has been less disturbed by agricultural undertakings in Ireland than in our own island; and, therefore, until the cultivation of the potato, of late years, many valuable remains of antiquity had lain hidden. The immense extent of bog land in Ireland, where such articles might be securely concealed from the invader, and the tendency of peat or bog to grow, and overflow the adjoining lands, and thus cover even the habitations of men, have been additional causes for the less early discovery of metallic relics. Captain Mudge, who was recently employed in making a survey of the coast of Ireland, discovered, in cutting a bog, a series of wooden buildings of a very rude character; and the stone axes, with which the timbers had been hewed into shape, were found on the spot, which were, no doubt, covered by the moving bog while in the very act of construction, and so remained until discovered by Captain Mudge. These must have been built at a period previous to the Celtic invasion, as stone axes were the implements of the Tuath de Danaans, which Sir W. Betham translates, "Northern people." Ancient silver articles are of much rarer occurrence than those of gold, which has been attributed to the ease with which the latter metal may be collected, in a pure state, from the soil washed down by mountain torrents, while silver requires all the labour

and skill of mining and refining operations. Besides this, we have no record of silver mines; but tradition asserts that there was anciently a gold mine in the county of Wicklow. Moore, who has seized the ancient legends of his country to embellish the productions of his genius, says:—

"Has Love, to thy soul so tender,
Been like our Lagenian mine,
Where sparkles of golden splendour
All over the surface shine?
But if in pursuit we go deeper,
Allur'd by the gleam that shone,
Ah! false as the dream of the sleeper,
Like Love the bright ore is gone!"

Ireland was, perhaps, indebted to Spain, the Peru of the ancient world, for her silver.

Among the antiquities found in Ireland are rings of gold, silver, Celtic brass, and likewise some of jet, coal, or ebony. Cæsar tells us that the Gauls "use for money, gold and iron rings, by certain weight;" and Sir W. Betham adds, that such money seems to have been a new idea to Cæsar. Herodotus mentions the Lydians as being the first coiners of money, 600 years before Christ; and we may imagine that, in 560 years, the Roman world may have lost all remembrance of the earlier form of money. In the paintings that have been recently discovered in the tombs at Thebes, in Egypt, are representations of people bringing, as tribute, to the foot of the throne of Pharaoh, bags of gold and silver rings, at a period before the Exodus of the Israelites.

Vast quantities of articles in gold and brass are also found, the use of which has not a little puzzled the learned antiquaries; but it is now clearly shown by Sir W. Betham, that they were the larger species of money. The above gentleman has traced the gradual degrees between the common ring and the strangely formed specimens, which Vallancey supposed to be sacrificial cups, and which other writers have suggested might be fibulæ, or buckles. The opinion of Vallancey seems untenable, because many of these articles have flat surfaces instead of cups, and would hold no liquor whatever; and the objection against their being buckles is, that a fastening of gold, *fifty-six ounces* in weight, appears absurd, besides that undoubted fibulæ of the precious metals and brass (a mixture of copper and tin), are found in Ireland in great quantities, and of convenient shapes.

Sir W. Betham's opinion is, however, placed beyond dispute, by the regular scale of weight which he found both the rings and other articles to bear; all being multiples of twelve grains, or half a penny-weight. The smallest ring was of that weight; and of thirteen which he examined of different sizes, all bore a correct proportion to the smallest, except two. These, however, contained each two fractional thirds of twelve grains; and, "it is possible they may have been so graduated for convenience of exchange, as our half-crown is contrived to represent 2s. 6d., or as the old quarter of a guinea, represented 5s. 3d." Mention is made in the Irish Annals of rings having been presented by the princes of Ireland to the Corb, or successor of St. Columbkil. In 1151, Cooly O'Flynn presented one, weighing two ounces; and in 1153 another, weighing one ounce. In 1004, Brian Borholme presented to the altar at Armagh, a ring of gold weighing twenty ounces. It is observed that all are described as of equal weight in ounces. The other gold specimens, those of uncertain shape, also were of regular weight, either in ounces, or multiples of half a pennyweight, except two or three, having apparently lost a small part of their weight by attrition. Sir W. Betham examined, also, six silver rings, which were equally correct as to weight, and three cast brass rings, the weight of which was of equal pennyweights. The smaller specimens of the brass ring-money which were perfect, were not quite so accurately balanced as the gold and silver; and of eight

it is singular that, with one exception, they exhibited odd multiples of half a pennyweight.

The foregoing examination proves that the Celtic ring-money was formed upon the same scale as what we denominate Troyweight. A pound Troy of gold formed 480 rings, each weighing half a pennyweight, 40 of which were equal to an ounce. "The Troyweight is said to have been brought to Europe from Palestine and Egypt, by the Crusaders; and obtained its present name from the town of Troyes, in France, where it was first used at the great fair held there. There is reason to believe that it is the old Phœnician mercantile standard weight, which once prevailed all over the East, and that, like most other commercial improvements, it originated with that great commercial people, as they must have first felt the necessity for such a means of adjustment of those commodities which were disposed of by weight. The old Celtic *unsha* was the exact ounce Troy; it is a compound word, *one* and *sixth*, or the one-sixth part of a given weight, containing the quantity of our half pound Troy; the name of this weight, I (Sir W. Betham) have not yet been able to ascertain. The weight of twelve ounces, now called a pound, having eventually prevailed in general computation of larger quantities, the word *unsha*, as the *twelfth part* of a pound, became the Celtic, and from thence the Latin word, signifying the *twelfth part of anything, even of time*."

We do not refer to what we have said as a corroboration of the early colonization of Ireland, by the Phœnicians, a fact now we apprehend too fully established, to need corroboration; even prejudice has yielded the point; but we must observe that it carries us very far back as to date.

We will now refer to papers read by Sir W. Betham before the Royal Irish Academy, November 1836, and January 1837, in which he says, that corroborating information, and evidence have crowded upon him on this subject.

A vessel going to Africa, to trade with the natives, was wrecked near Cork, in the summer preceding. Among the articles on board for barter, were some boxes of cast-iron pieces, so exactly like one species, (that heretofore termed *pateræ* or *fibulæ*), of gold articles found in Ireland, that it is quite impossible to refuse assent to the notion of their being of the same use and intent. "These articles are manufactured at Birmingham, and are a composition of brass and copper; they are called *manillas*, and are worn as ornaments, and pass as the representative money in Africa. They send out about forty chests annually." "The ship, which was lost, was bound to the river Bonney, or New Calabar, which is not far from the kingdom of Benin. The trade to these rivers for palm oil and ivory, is cotton goods of great variety, gunpowder, muskets, and an extensive number of other articles, and *manillas*, both of iron, and copper mixed, which is the money that the people of the Ebor and Brass country, and all the natives in that neighbourhood, go to market with." In Sennaar also, pieces of gold in the form of rings pass current; they have a cut in them, and the gold is so pure, that they are looped together, and the cut easily closed, forming a chain.

The name of *manilla* is remarkable, and it is no doubt the name which the articles bore in Phœnicia, and by which they were known when first introduced to the knowledge of the African negro nations, who have preserved it to our day. In the Celto-Phœnician it literally means *the value or representation of property*. "Main," riches, patrimony, goods, value, and "callac," cattle, or any description of property; whence our word *chattels*. Thus it appears that as *pecunia* had its name from *pecus*, cattle, because flocks and herds were the first riches, and the number of cattle were the standard of value before money existed, and where it was not to be had; so *manilla* means literally *the value of cattle or goods*, or the representative of the value of cattle, or any *chattel* property.

Benin and Calabar are situated on the Gulf of Guinea; in latitude from 7 to 10 North, longitude 5 to 10 East of London. It would appear from the above facts that the Phœnicians had penetrated to the Gulf of Guinea, and were acquainted with the whole of this coast, probably beyond the line. We know that they circumnavigated Africa, by order of Pharaoh Necho, King of Egypt; and that afterwards the Carthaginians under Hanno, reached to the southward of Sierra Leone; but we may now suppose that either the latter people or their parent state traded regularly to the Coast of Guinea, and there introduced a money which still bears a Phœnician name, and is still in as much estimation as it was when the merchants of Tyre supplied them with *manillas* in exchange for their gold, ivory, and palm oil.

"The Romans knew nothing of the western coast of Africa beyond Sallee; the coast of Guinea, within ten degrees of the equator, was far beyond their cognizance; consequently during their sway, the inhabitants of that district, having no intercourse with any great commercial people, their customs and habits of commerce received no impetus likely to produce any change in their ancient mode of traffic; and the metallic currency they learned from the Phœnicians, remains to this day unchanged. The English, finding the *manillas* current, naturally availed themselves of the facilities which they possessed of *fabricating* them; it can scarcely be justly called *counterfeiting*, because they bear no impress nor marks of authority. The Carthaginians may have carried on the trade with these coasts after the destruction of Tyre, but there is no evidence that they or the Romans ever visited them. The intercourse of European nations is of very recent date.

We here close our remarks upon the earliest medium of exchange with which we are yet acquainted; but the extremely ancient time at which this was used, leads us to conjecture that the system of barter did not long, if at all, survive the Deluge, at least among the civilized nations who speedily sprang up from that visitation; indeed, admitting the possibility of the existence of scientific instruments and discoveries, previous to the Deluge, we can see no reason why a convenience so important as some form of money, should have remained neglected or undiscovered. Perhaps future researches may throw some light upon the first years of the new birth of the world.

F. C. B.

THE BENEFITS RESULTING FROM THE EXISTENCE OF PAIN.

It was a fine summer evening at Ashford Vicarage; —Mr. and Mrs. Dalton were sitting at the window of their little drawing-room, which opened upon the lawn, where their three boys were playing at trap-ball, when Mr. Dalton, looking at his watch, suddenly called out, "Boys, who will go with me and meet the coach at Ashford Bridge? I expect a parcel to-night, from London."

"Oh, I will, and I, and I!" was heard from the lads; and, in less than five minutes, bats and balls were put away, jackets and caps picked up, and all four were on their way to the village inn, which stood at the foot of the hill, where the coach changed horses.

The coach was just at the top of the hill, as they came in sight of the bridge; it was heavily loaded, the wheel was corked, and as it swayed from side to side, down the steepest pitch of the hill, Mr. Dalton and his boys feared for the safety of the passengers.

In a moment, the chains of the skidpan which held the wheel broke, and the coach, having nothing now to retard its progress, pressed harder and harder on the tired horses, till they were driven into a gallop, unable to resist the weight of the coach, or to guide it in its descent. That which might be feared soon came to pass. The road turned at a sharp curve at the entrance of the bridge, and the coach, continuing in a straight

line, dashed against the left hand pier, and was instantly upset. The cries and shrieks of the poor passengers soon told that some injury had been done. The horses had been thrown down by the shock, and one of them lay groaning most piteously, having his thigh broken by the wheel falling upon it. The inside passengers had escaped without broken bones; but were bruised by the fall, and cut by the glass of the broken windows.

But the outside passengers were not so fortunate: the coachman had his collar bone broken by the fall; while a soldier's wife, travelling to meet her husband after a long absence, lay senseless on the ground, clasp- ing in her arms a young child of two years old, and endeavouring to protect it from the weight of a large and heavy packing case, which had fallen upon her. All who were comparatively less hurt, immediately hastened to assist her: the box was speedily, but gently, lifted off, but the truth was too plain; the arm of the mother was broken, and the poor child, which had been struck severely upon the head and several parts of its body, lay apparently in great agony.

Not a moment was to be lost; fortunately the inn was close at hand, and all did their utmost to relieve the sufferers. One lady held her smelling-bottle to the fainting woman, supporting her head in her lap; another bound up her wounded arm with her scarf; and others, having made for her a soft bed with shawls and cloaks on a loose gate which lay at hand, carried her to the Ashford Arms, where she was soon placed with her suffering child, in the best and softest bed, and medical aid was immediately sent for. The coachman was sufficiently strong to go on in the coach, which had not been materially injured, to the neighbouring town, where he was taken to the Infirmary, and soon placed in a clean and comfortable bed, and his broken bone was set. Mr. Dalton having, with his boys, rendered all the assistance he could, and given full directions to the master of the inn to let the soldier's wife want nothing, returned to his own house. The boys were sad and silent as they walked along: they were evidently thinking of the scene they had witnessed, and they did not fail to give their mother a full account of the accident.

At last, when they were sitting at tea, after a long pause, Alfred, the eldest boy, began:—

"I can't help thinking, papa, of that poor woman, and her dear little child; how sad it was to hear it cry out so piteously, and no one to be able to know how to relieve it!"

"And the coachman, too," said Edmund, "how well he bore his pain! I am sure it pained him a good deal, for I saw him bite his lips and clench his hand; and yet he never cried out once, but was only busy in showing how to relieve his passengers."

"And I am sorry, too, for the poor horse," said Cyril, the youngest, "for it could not speak, or ask for anything; and nobody seemed to care about it, except one man, who said, 'Poor thing! we had better kill him, and put him out of his pain.'"

"It is sad, my boys," said Mr. Dalton, "to behold any one in pain, whether it be a dear child, a strong man, who tries to bear up under it, or a poor dumb creature, that feels, but cannot tell us, its sufferings; but I have no doubt, if we knew all the reasons why pain was sent into the world, that we should see it was 'all for the best.'"

"All for the best, papa!" said Alfred; "pain and agony all for the best! how can that be, that anything can be a good thing, which we heartily wish to get rid of, such as pain and trouble?"

"I did not say it was a 'good' thing, Alfred," said his father, "but only that it was 'all for the best.' Many things are for the best, which are not good and pleasant in themselves. The pain to which the doctor put the soldier's wife in setting her arm was 'all for the best,' and yet it was not good in itself."

"But, papa, what good can there be in pain? who

would not say that it was all bad? it causes us trouble—it makes us uneasy in our bodies—fretful and ill-tempered—and, even if we are not in pain ourselves, it hurts our feelings to see those whom we love in pain. Would it not be a good thing if pain had never come into the world? does it do us any good? should we not be much happier without it?"

"Alfred," said his father, "you have asked too many questions to be answered at once: but I will answer them one by one."

"Now, first, it is of no use our asking whether we should not be happier without pain, for that cannot be;—it has pleased God to send pain into the world, and to give us bodies capable of feeling pain, and pain we shall have as long as we are in this world: and, therefore, it is no use thinking whether we should not be happier without it, because we must have it."

"But, secondly, I doubt if we should be happier without it: I mean to say, that I doubt if we are not better off now, both in our bodies and minds, than if there had been no such thing as pain in the world."

"Oh, papa, how can you think so! now do tell me one single good which you think has come from our being able to feel pain."

"Well, then, to begin:—First, if your body was not able to feel pain, you yourself might injure yourself without knowing it; a child, in play, might do you serious harm; or a wild beast, or a spiteful enemy, might come upon you while you are asleep, and put out your eyes, or maim your limbs, or disfigure your face with wounds and bruises, if you felt no pain to awaken you; and so you might be robbed of some of your limbs or senses, because you had not this useful watch-dog, Pain, to guard your body, and tell you when any one was going to do you harm."

"Well, papa, so they might; I never thought of that."

"Or you yourself might eat something which would destroy your life, or your limbs, and if it gave you no pain so as to make you dislike it, you might do yourself a great injury. Do you remember meeting Sam Burton, when he had just eaten some of those berries from the hedge?"

"Yes, that I do; and how he roared out with pain, and flung the rest he had picked into the ditch."

"Well, those berries were deadly poison, and if they had given him no pain, he would probably have gone on eating, till he had poisoned himself, or injured his health."

"O, now, papa, I see some good from our bodies being able to feel pain."

"So then, you see, pain is the great guardian and watch-dog to warn us to protect our bodies, and the advantage of it is very much missed in those cases where our bodies may be injured, without our feeling pain. For instance, in the polar regions, a man's ears or nose may be caught by the frost—it gives him no pain—and, unless some kind friend is nigh to tell him of it, and to use the proper remedies, the man's nose or ears are lost. Again, a poor man lately went to sleep near a brick kiln, with his feet towards the fire, for the sake of the warmth; the vapours from the kiln soothed him to sleep, and he felt no pains; but in the morning, his feet were both burnt off at the ankles!"

"O, how sorry he must have been to have not felt pain, and so saved himself from being a cripple!"

"Indeed, if our bodies are not in a state to feel pain, but all numbed, and without feeling, we may be sure they are not in a good state of health; and the worst sign of all after violent pain in inflammation is, if we feel no pain, for then we may be sure mortification is begun; the part is dead."

"Well, papa, I am sure I did not know it was of so much consequence to be able to feel pain, although there is no pleasure in feeling it."

"Yes; you see the power to feel pain is necessary as a protection to our weak, perishable bodies, not only against wilful and malicious injury, but against uninten-

tional or accidental harm. And, although we do not doubt that excess and frequency of pain was laid upon man as a punishment for sin, yet it may be questioned, whether, even in Paradise, there was not so much power of feeling pain as was sufficient to secure our first parents from harm. I mean, whether, even in Paradise, the bodies of our first parents were not made so far liable to pain, as they might be liable to injury if they had not this secret monitor to warn them against accidental injuries, or their own well intended but mistaken efforts for their good.

"If the sharp thorn, or the pruning knife had caused no pain, if the heavy stone had caused no bruise, even Adam might have unintentionally injured his body, or his senses, and so far lost some of his happiness and usefulness; and though we believe thorns and thistles to have been multiplied, and pain to have been made more frequent and excessive in consequence of sin, we cannot but think it probable that some slight capability of feeling pain may have existed in man even when in innocence, sufficient to warn him against hurting his own powers, and so diminishing his happiness."

"But, papa, you said you thought that we were even upon the whole happier now, than if pain had never existed. I cannot understand that."

"Yes, I do think so.—I think that, in trying to find out remedies for those in pain, we have found out comforts for those in health; like the farmer's sons in the fable, we have found treasures which we did not seek. Pain has been the means of increasing our knowledge, our skill, and our comforts. Look to the discoveries made in Science, in Botany, in Chemistry, in Anatomy; what a knowledge have we gained of the structure and uses of plants, while we were seeking some herb to soothe pain or cure disease!—what a knowledge have we gained of drugs, and salts, and earths, useful for agriculture or for the fine arts, while we have been seeking only to find an ointment or a medicine;—we have sought a draught to allay the burning thirst of a fever, and we have found a dozen delicious beverages to drink for our pleasure or relief. We studied Anatomy to find out the seat of disease, and how to attack it, and we found what we did not seek, a thousand wonderful works of God; a thousand most curious contrivances, most admirable delights! We found a model for the ribs of a ship—we found a pattern of a telescope in the eye—we found joints, and straps, and knittings, and valves which have been copied into the workshop of the mechanic, and the study of the philosopher. Yes, my boys—we may thank our liability to pain for these—for if pain had not existed, who can tell whether these things would have been so soon, if at all, discovered?"

"But, papa," said Edmund, "you said that pain had been the cause of finding us comforts, did not you?"

"Yes, I said that in trying to find out remedies for those in pain, we had found out comforts for those in health. Does no one use an easy chair but a sick man? Does no one use a leg stool but a gouty man? Cyril, I caught you sipping your little sister's jelly last week, when it was taken up to her, when she was ill. How many nice dishes, invented just to please the palate of the sick man, are now found on the tables of those who are in health!"

"Yes, papa," said Cyril, "and Edmund, though he was not ill, asked nurse to warm his bed with the pan of coals, when it came from sister's room."

"There again, do you think a warming-pan was invented for men in health? yet how many of us delight in this luxury on a cold winter's night, even when not unwell! Look to the number of helps to indolence, and luxury, soft footstools, spring-seated chairs, tables for meals in bed, reading-desks, which, first invented for those who were unable to move without pain, are now used as comforts by the aged, or luxuries by the idle! Have not skill and invention been stimulated and encouraged by these requirements for the sake of relieving pain? And has not the discovery first made for

the sake of the sick been advanced for the benefit of the healthy? Have not magnifying glasses, invented for those who cannot see clearly, been used as microscopes by those who can see? Have we not studied how to make the deaf hear, till now we have learnt how to build churches and public halls in that shape which shall best convey sound? Yes, depend upon it, my boys, to pain and infirmity we owe the discovery of most of the comforts and luxuries of life; and although they are too often now made to serve for the encouragement of indolence and effeminacy, yet be sure, they were invented for good, for the soothing of pain, and the relief of infirmity."

"Papa," said Edmund, "you said that pain was given us as a watch-dog, to warn us against any injury offered to our bodies, but you know the poor woman felt pain when her arm was set, although the Doctor does not wish to injure her, but to do her good. Why should we feel pain when it is a friend coming to benefit us, not an enemy to injure us? Our watch-dog, Lion, does not bark at friends, but only at strangers."

"Very true, Edmund," said Mr. Dalton, "but remember it is the watch-dog's business only to awaken the household, if he sees any one coming to do violence, whether with a good or bad intent. It is for the master to see whether he is a friend or a foe; and so either to permit the violence, or to resist it. Don't you remember how our dog Lion flew at our old friend, Mr. Bush, because he pretended he was going to strike me?"

"O yes, and almost pulled him down to the ground."

"Well, the dog did not know that it was in fun. He only saw some one attempting to do me hurt, and without delay he gave me notice of it. So the first act of violence done to our body arouses up pain to give us warning of it, whether it be done by friend or foe: it is then our part to see whether it is done with an intent to benefit or to injure us, and so to bear it patiently, or to resent and remove it."

"But, papa," said Cyril, "this relates only to men and their pain. What has this to do with brute animals? Why should they suffer pain, like that poor horse to day? they have not sinned, like men: why should they suffer?"

"Ah, Cyril," said his father, "you have asked as hard a question as any of them. Why should the brute creation suffer pain? It is true, my boy, it can not be for their sin, as we believe it to be for ours; but may it not be to make us think more of the wickedness of sin, which has thus plunged the whole creation into pain and suffering, even that part of it which has not sinned? Perhaps the intention may be, so far as we are concerned, only to make us think, and fear God's anger, and fly from it. That as often as we see a worm writhing in our path, or a poor horse groaning in pain and killed as a mercy, we should be led to think on the evil of sin, and to be more watchful over our conduct. But whatever may be the real reason for this mysterious infliction of pain and suffering on the brute creation, it is no doubt a great mercy to man that they are so capable of feeling pain."

"A mercy to man, papa," said Edmund, "that animals should be able to feel pain! How can this be?"

"Yes, my boy, it is so," replied Mr. D., "for it gives to man the power of subduing all animals to his will. It was God's gift to man at the creation, that the fear of man and the dread of man should be upon all the beasts of the field; and what could they dread if they had not been capable of feeling pains of body? No, it is man's superior power of inflicting pain, joined to the brute beasts' dread of it, that gives to man that dominion over the beasts of the world that makes them useful to him for his work or pleasure. How should man be able to make the mighty elephant do his bidding, if the animal did not know his power of inflicting pain if he refused? How could man curb the fiery horse, or goad on the stubborn ass, if these animals were not capable of feeling pain? Have we not seen even lions tamed

through fear of the lash, and leopards and tigers taught to obey man's commands? Yes. I repeat, whatever may be the real reason for this mysterious dispensation of suffering to brute animals, to man it is a great mercy that they should be capable of feeling pain, for it is the consciousness of this in the minds of the brute creation by which man is enabled to maintain his authority over the beasts of the field, and to make them subservient to his own purpose."

"Well, papa," said Alfred, "what a number of benefits you have shown us to arise from our power of feeling pain: I did not think there were any at all."

"Oh," replied Mr. Dalton, "I have, as yet, mentioned only one class of the good results of it—the physical benefits of pain, as regards its influence on our bodies. I have many more to mention yet; viz. the moral and religious benefits we derive from our liability to pain. But we have talked enough for to-night; I see you are tired, so we will leave these till to-morrow evening. Good night, my boys."

"Good night, papa," said each of the lads; "and thank you, papa, for what you have told us."

(To be continued.)

INDIAN TRADITION.¹—No. II.

ONCE upon a time, a young Indian hunter said to his sister, who was a medicine woman, or conjurer, "Sister, where does that deep path in the wood lead to?"

"Oh! my brother," she replied, "you must not go along that path, for many people have gone down it, but none ever return."

"Well, sister, but I cannot stay here all my life. I must travel, and be a man, and seek a wife. There is plenty of dried meat to last you two or three years. Will you make me some shoes?" She at length consented, and made him a dozen or twenty pairs, and he set off.

After travelling two or three days he came to a village, and was conducted to the chief's tent, or "lodge." After supper, the chief said he was very sorry he had come, for a great giant, called Windego (or Mandego), came every morning to the village, and took away and ate two men, and had destroyed nearly all their people. But he replied, that he had had many dreams, and had never dreamt of being eaten by a giant, and was not at all afraid. So in the morning the giant came to the tent, and demanded the stranger; but the chief begged he would not insist upon it, for he was a stranger, and must be treated hospitably and sheltered. He, however, persisted in his demand; upon which the young man came out singing and praying to his gods. When Windego saw him, he was very angry, and said, "What do you mean, boy, by coming out and making that noise? I am going to eat you."

"Oh! no," replied he; "I will kill you instead." So he let fly an arrow which struck him in the heart and killed him. His own tomahawk was too small, so he took the giant's, and with it cut off his head.

He then went forward to another village, where the same events happened; and this was repeated ten times. When in the last village, the chief told him he would meet no more Windegos, but would come to three lodges, a day's journey from each other; that there would be an old woman in each, who would treat him very kindly on his arrival, but would kill him during the night, if he fell asleep; so that he must on no account go to sleep, however tired he might be.

Accordingly he arrived by night-fall at the first lodge, and, going in, addressed the old woman with, "Well, Granny! what cheer?" who replied, "Come in, my grandson." He then told her that he was very hungry,

and she gave him some dried blackberries for his supper. There were not more than he could hold in his hand, and he thought, "I shall never be satisfied with so little as this;" but, as he ate, the berries became more numerous, and he could not finish them. He then lay down, and pretended to go to sleep; but watched, and soon saw the old woman rise, take a tomahawk, and come towards him, upon which he jumped up, and seizing his own, he killed her.

The third night, the old woman told him, after he had eaten his berries, that he would come to no more lodges, but would reach a river without any ford, where he would see a mud turtle that would carry him over if he gave it some tobacco. She also intended to kill him, as the others had done, but he killed her instead.

About noon, the next day, he came to the river, and saw a large turtle, to which he said, "Turtle, I will give you some tobacco if you will carry me over the river."

It agreed to it, and took him upon its back; but, when half over, it said, "I have a great mind to let you sink, by swimming from under you."

"You had better not, for if you do I will shoot you." It then carried him safely across.

He soon came to an old man's lodge, who wished him to stay; but he would not. So the old man told him he would come that night to a lodge, through which the path lay, and through which he must pass, if he would continue his journey. He added that ten young girls lived in it; nine of whom would offer him black fruit, and try to pull him towards her, and invite him to stay with her; but the tenth, who was at the furthest end of the lodge, would offer him a white fruit. He must push on till he came to her, and he might stay with her in safety. He then gave him two large round stones, and twelve long sharp-pointed bones, saying that they might, perhaps, be useful to him, and regretting that he had nothing more valuable to offer him.

He then proceeded on his journey, and by night reached the lodge, through which he pushed his way, being in some degree assisted by each one trying to pull him from the other, so that he came at length to the tenth, who offered the white fruit, with whom he stayed. After supper he asked his companion what was the meaning of the nine girls that he had seen. She told him he was very fortunate in having passed them, for if he had not, he would have been killed that night. They were ten sisters; and the first nine were married, the husbands being all large serpents. In general, the traveller, being tired, did not care with whom he stayed, and the husband then came out and killed him. Upon this he looked and saw nine large serpents asleep in the tent, and the women asleep also. So he put the two stones into the fire, and when they were hot he choked first one and then another, until he had killed them all, by thrusting them down their throats.

The next morning he went on his way, but could scarcely distinguish the path. Many previous travellers had come as far as this lodge, but here they had always been killed; so that the path was good up to this point, but, beyond it, the untrodden grass and wild flowers left scarcely a mark to guide his steps. He, however, went on, and by night came to a steep hill, on the summit of which was a lodge. This he entered, and saw an old woman and her daughter, the former of whom he saluted as before, with, "Well, Granny! what cheer?" She invited him in, and made him some supper; after which she said that she wished he would marry her daughter, for she had never before seen any one to whom she had liked to give her.

In the night the daughter awoke him, and told him he must not stay, for her mother meant no good to him; and she wished he would go away and take her with him. She said her mother would pretend to be sick in the morning, but it would only be to lay some trap to do him harm. But he replied, "Oh! I have dreamt many dreams in my fasting days, and nothing was ever to hurt me."

(1) This tradition, like the former, (see page 125,) was communicated to the writer by a North American Indian.

In the morning the old woman did pretend to be sick, and he said, "Well, Granny! what's the matter with you?"

"Oh, my son, I am sick. I want some lion's flesh. That would make me well again."

So he said he would try to get her some; and she showed him a ledge of rock, where were many of them, intending him to go amongst them, when they would kill him. But he went upon a higher ledge and met one by itself, which he killed and took home. Another morning she again pretended to be sick, and said, "Oh! I remember, when I was a girl, I used to ride on a carriage down such a beautiful slope; if I could have a ride now I should be quite well." He offered to accompany her; so she got the carriage, and took him to the summit of a slope, and desired him to get in in front, and she would sit behind. When he was seated she gave the carriage a push, and sent it down the slope and right over the edge, for she had taken him to the end of the world. (The Indians think that the world ends abruptly in a steep hill.)

Whilst he was falling, he prayed to his gods that he might not be much hurt; and when he came to the bottom he looked up, and saw that he had fallen from a tremendous height. However, as he had his long sharp bones with him, he thought he might climb up again; so he took two of them, and by sticking them into the side of the rock, one above the other, and pulling out first one and putting it in higher, and then the other, he got up very slowly. He wore out one pair every day, and it took him six days to get up; and just as his last pair was worn out, he could put his hand upon the top, and get upon the world again. He then went back to the lodge, and simply said, "Ah! you old woman, you played me a nice trick." She pretended to be very sorry; and she was very sorry to see him come back.

At night his wife wished him very much to go back to his own home, and to take her with him. So he took her and tied her to one of his arrows, and shot her in the direction of his lodge, and she fell a few yards from the tent door. He then set off running, and his gods helped him, so that he reached home in a few minutes. And when he came to his wife he said he must go and tell his sister, before he took her to the lodge. When he got there, he saw his sister looking very dirty and neglected, and he called, saying, "Sister, I have come home again." But instead of looking up, she only threw ashes in his face, and said, "Get away, you idle foxes; you have cheated me so often." For he had been away a long time on the whole; and soon after his departure the foxes used to come and cry out, "Sister, sister, I have come home;" so she thought it was merely they that had returned. But he went in, and then she was very glad to see him; and he brought his wife to her, and they lived very happily together all his life.

THE POPULAR YEAR-BOOK.

April.

APRIL is the only month of the year which is not called after Roman deities, or according to its place in the old Kalendar. Its name is derived from the Latin word *aperire*, to open, because the earth seems now to open itself and produce its fruits. The Romans dedicated this month to Venus. The Saxons termed it *Ester*, or *Easter-monat*, either from the feast of their goddess Eastre, Easter, or Eoster, or because the winds blow generally from the east, at this season.

April is sometimes pictured as a youth or maiden, winged, and robed in green; crowned with a garland of myrtle and hawthorn buds: holding in one hand primroses and violets, and in the other the zodiacal sign, *Taurus*, or the Bull, into which constellation the sun

enters on the 19th of this month. It is thus portrayed by Spenser:—

"Next came fresh April, full of lusty-hed,
And wanton as a kid whose horn new buds;
Upon a bull he rode, the same which led
Europa floating through th' Argolick floods:
His horns were gilden all with golden studs,
And garnished with garlands goodly dight
Of all the fairest flowers, and freshest buds
Which th' earth brings forth, and wet he seem'd in sight
With waves, through which he waded for his love's delight."

April is proverbial for its variableness. It generally begins with raw and unpleasant weather, the influence of the equinoctial storms still in some degree prevailing. Then come bright and warm days of sunshine, but they are frequently overcast with clouds, and chilled with rough wintry blasts accompanied with showers. Still, April has been celebrated as the sweetest month of all the year; partly because it ushers in "the May," and partly for its own sake. "It is worth two Mays," says a modern author, "because it tells tales of May in every sigh that it breathes, and every tear that it lets fall. It is the herald, the promise, the prophecy, the foretaste of all the beauties that are to follow it—of all, and more—of all the delights of summer, and all the 'pride, pomp, and circumstance of glorious autumn.' It is fraught with beauties that no other month can bring before us, and

'It bears a glass which shows us many more.'

Its life is one sweet alternation of smiles and sighs and tears, and tears and sighs and smiles, till it is consummated at last in the open laughter of May."

Early in this month the swallow returns. The kind first seen is the chimney or house swallow, known by its long forked tail and red breast. This harbinger of summer is followed by the martin, the swift, wryneck, cuckoo, redstart, wagtail, nightingale, black-cap, pied fly-catcher, wren and willow-wren, lark, white throat, ring-ouzel, turtle-dove, lapwing, and tern. The bittern booms; and all the birds are now busied in pairing, building their nests, laying, &c. As their singing is "the voice of courtship and conjugal love, the concerts of the groves begin to fill with all their various melody." The nightingale is audible soon after the arrival of the swallow. He sings by day as well as by night; but in the day-time his notes are drowned by those of his feathered companions: in the evening these are heard alone; whence his song has ever been associated with the vesper time.

In April poultry broods are hatched in numbers. Most of the insects awaken from their winter lethargy. Moths, butterflies, dragon-flies, beetles, ants, flies, worms, mole-cricket, spiders, and slugs, are very numerous. Fish bask in the sunshine, on the surface of the water. The changes of the weather above alluded to, have a potent effect in hastening vegetation; and perhaps "the great charm of this month, both in the open country and the garden, is the infinite green which pervades it every where, and which we had best gaze our fill at while we may, as it lasts but a little while, changing in a few weeks into an endless variety of shades and tints, that are equivalent to as many different colours." The black-thorn, ground-ivy, box-tree, sycamore, and many fruit-trees are loaded with flowers or blossoms.

"Now daisies pied, and violets blue,
And lady-smocks all silver white,
And cuckoo-buds of yellow hue,
Do paint the meadows with delight."

The chequered daffodil, primrose, cowslip, harebell, wood anemone, and some orchis plants, also enliven our fields and woods. Lilacs, ranunculuses, polyanthes, hyacinths, tulips, and honeysuckles, bloom in our gardens: and the wood-crowfoot and marsh marigold, in wet marshy places. Early potatoes and mangel-wurzel, carrots and Swedish turnips, and evergreens are planted. The farmer is still employed in sowing different sorts of grain, and seeds

for fodder; for which purpose dry weather is yet suitable; though plentiful showers at due intervals are desirable for the young grass and springing corn. April, indeed, was considered by our ancestors as most favourable when wet, and they expressed this opinion in such proverbs as the following:

"March winds, and *April showers*,
Bring forth May flowers."

"In April, Dove's *flood*
Is worth a king's good"—

or *ransom*, which would seem to have been a favourite and strong expression with the people. "The Dove," says Brady, "is a river of Staffordshire; and when it overflows in consequence of a great fall of rain, the adjoining meadows are fertilized, and hence, by analogy, similar favourable results are inferred to the kingdom at large."

April consists of thirty days, which was the number assigned to it by Romulus. Numa Pompilius deprived it of one day, which Julius Cæsar restored, and which it has ever since retained. It held the first station in the Alban Kalendar, and then consisted of thirty-six days.

BILLS OF FARE FOR APRIL.

I.

Veal and bacon, or pullet and bacon.
Green geese.
Roasted veal, or roasted with a pudding in it.
Spring, or lumber pye.
A tansie.
Rabbits and tarts. You may add salmon and lobsters.
Frauns, or asparagus.(1)

II.

FIRST COURSE.—A brisket. Cold lamb. A roasted haunch of venison. A goslin. A turkey. Chickens, custards, and almonds.

SECOND COURSE.—A side of lamb in joints. Eight turtle doves. A cold neat's-tongue pye. Eight pigeons, four of them larded. Lobsters, and a collar of beef tansies.(2)

April 1.—On this day the old Romans abstained from pleading causes, and the Roman ladies performed ablutions under myrtle-trees, crowned themselves with myrtle, and offered sacrifices to Venus. "This custom," says a late writer, "originated in a mythological story, that as Venus was drying her wetted hair by a river side, she was perceived by satyrs whose gaze confused her:

'But soon with myrtles she her beauties veiled,
From whence this annual custom was entailed.'"

The first of April was anciently observed in Britain as a high festival, in which an unbounded hilarity reigned through every order of its inhabitants. Brady remarks, that our almanacs generally, until about a century since, and many of them to a much later period, used to distinguish the first of April by the title of *ALL FOOLS' DAY*. The origin of the usage which gave rise to this appellation is involved in obscurity; but the practice of fool-making on the first of April, is, doubtless, very ancient and very general. Some have conjectured that it has an allusion to the mockery of our Blessed Lord by the Jews. By others, the custom is said to have begun from the mistake of Noah sending the dove out of the ark before the water had abated, on the first day of the month among the Hebrews, which answers to our first of April. In England, the fun of the day is to deceive persons by despatching them upon frivolous and nonsensical errands; to pretend they are wanted where they are not; or, in fact, in any way to betray them into some ludicrous situation, so as to entitle them to the epithet of "an April fool."

Poor Robin's Almanac for 1760 contains the following metrical allusion to these "fooleries":—

"The first of April, some do say,
Is set apart for *All Fools' Day*;
But why the people call it so,
Nor I, nor they themselves, do know.
But on this day are people sent
On purpose for pure merriment;
And though the day is known before,
Yet frequently there is good store
Of these forgetfuls to be found,
Who're sent to dance Moll Dixon's round;
And, having tried each shop and stall,
And disappointed at them all,
At last some tell them of the cheat,
And then they hurry from the street,
And straightway home with shame they run,
And others laugh at what is done.
But 'tis a thing to be disputed,
Which is the greatest fool reputed,
The man that innocently went,
Or he that him designedly sent."

A writer in the *Spectator* observes:—"In proportion as there are more follies discovered, so there is more laughter raised on this day, than on any other in the whole year. A neighbour of mine, who is a haberdasher by trade, and a very shallow conceited fellow, makes his boast that for these ten years successively he has not made less than a hundred fools. My landlady had a falling out with him about a fortnight ago, for sending every one of her children upon some sleeveless errand, as she terms it. Her eldest son went to buy a half-penny worth of incle at a shoemaker's; the eldest daughter was despatched half a mile to see a monster; and, in short, the whole family of innocent children made April fools. Nay, my landlady herself did not escape him."

Hone remarks that the tricks that youngsters, and sometimes "children of a larger growth," play off on the first of April are various as their fancies. They send one who has "yet to know the humour of the day," to a cobbler's for a pennyworth of the best "stirrup-oil;" the cobbler receives the money, and gives the novice a hearty cut or two from his strap in return. Others are persuaded to go to some shop for half a pint of "pigeon's milk," or to a bookseller's for the "Life and Adventures of Eve's Mother," &c.

The practice of making fools on this day in some of our Northern counties is very similar to that in the South; but the persons imposed upon, instead of being called "April fools," are sometimes named "gowks." In Scotland they have a custom (termed "Hunting the gowk") of sending a person from place to place by means of a letter, in which is written

"On the first day of April—
Hunt the *gowk* another mile."

Brand observes that a *gowk*, or *gowk*, is properly a cuckoo, and is used here metaphorically in vulgar language, for a fool: "this," says Hone, "appears correct; for from the Saxon '*geac*,' a cuckoo," is derived *geck*, which means 'one easily imposed upon.'"

All Fools' Day is celebrated in France in the same manner as in England; and the person imposed upon, on this occasion, is there styled "Un poisson d'Avril," i.e. "an April fish." The same name is given by the French to the mackerel, a fish easily caught by deception, singly, as well as in great shoals, at this season of the year. The usage of making April fools prevails all over the continent. On the Sunday and Monday preceding Lent, it is thought at Lisbon very jocose to pour water on any person who passes, or throw powder on his face; but to do both is the perfection of wit. A lady relates that the first of April is marked in Provence by every body, both rich and poor, having for dinner, under some form or other, a sort of peas, peculiar to the country, called *pois chiches*; and, while the convent of the Chartreux was standing, it was one of the great jokes of the day to send novices thither to ask for these peas, telling them that the fathers were obliged to give them away to any body who would come for them. So

(1) "The Second Part of Youths' Behaviour," &c. 1664.
(2) The "Family Dictionary," &c. 1705.

many applications were in consequence made, in the course of the day, for the promised bounty, that the patience of the monks was at last usually exhausted, and it was well if the vessel carried to receive the peas was not thrown at the head of the bearer.

In some parts of North America, the first of April is observed like S. Valentine's day, with this difference, that the boys are allowed to chastise the girls, if they think fit, either with words or blows. The Hindoos at their Huli festival keep a general holiday on the 31st of March, and "one subject of diversion," says Colonel Pearce, "is to send people on errands and expeditions that are to end in disappointment, and raise a laugh at the expense of the persons sent. They carry the joke so far as to send letters, making appointments in the names of persons who, it is known, must be absent from their houses at the time fixed upon; and the laugh is always in proportion to the trouble given." Maurice, in his "Indian Antiquities," remarks, that "the jocund sports prevalent on the first day of April in England, and during the Huli festival," just mentioned, "have their origin in the ancient practice of celebrating with festive rites, the period of the Vernal Equinox, or the day when the new year of Persia anciently began."

Reading for the Young.

THE PET BULLFINCH.

His history was this. "Caught and caged"—I know not when nor where. My acquaintance with him began about ten years ago, when he came accidentally into the possession of an old lady of my acquaintance, with whom he soon became a great pet. He did not, at the time, appear to be a young bird: he was very tame, and had been taught to pipe a tune prettily. With this lady he lived four years. His aged mistress and himself passed hours in each other's society, and their mutual fondness was displayed in various ways. She reserved for her little favourite all the apple pips and crumbs of cake, which were considered by him as the greatest dainties; and he appeared to do every thing in his power to cheer her solitude, by piping the notes of his song, which was a very plaintive air; and by all those little endearments by which he so well knew how to express his regard. The door of the cage was usually left open; and he would fly out, perch on the arm of his mistress's chair, and take food from her mouth. To some of her visitors he showed a decided preference, which he testified by sitting on the shoulder or head of the chosen friend, and singing the few notes he remembered of his little song. To others who approached his cage his beak and threatening attitude plainly proved that he considered them unwelcome intruders. When his kind mistress died, he was taken by her daughter, Mrs. F. to her distant residence in the West of England. He soon selected Mrs. F. and her youngest daughter Mary for his peculiar favourites: to the other members of the family he seemed for some time perfectly indifferent. Mary scarcely knew at first how to manage with all her pets. Her little dog and her tortoiseshell cat, (a most accomplished bird-catcher,) had long been established as inmates of the parlour, and would not patiently brook the indignity of being discarded for a new friend. This difficulty, however, was soon overcome; it was not long before they became so well acquainted as to take little notice of each other; and the cat and the

bird have been accidentally left together, without any disastrous consequences. It is impossible for those who never saw this bird, to imagine the fondness he displayed for those who were the objects of his affection. The reasons which guided his choice were not always apparent; and his dislike in some instances was as striking as his partiality in others. His fondness for Mrs. F. was uniform, until about a year after he came into her possession, when he became very ill during the moulting season. After that time he did not discover any particular fondness for her, though no offence could be remembered. The person whom he fixed on as the object of his most active hostility was Mrs. F.'s eldest daughter. Though she was not so fond of animals as her younger sister, and had never taken so much notice of him, still she frequently offered him his favourite apple-pips, and had never, in any way that she knew of, vexed or hurt him. Sometimes he wrought up his little spirit into such animosity against her, that when he was hopping about the table after dinner, partaking of the fruit, he would suddenly fly into Anne's face, and try to peck her; and once he actually suspended himself by his beak fastened to her lip. After having exhausted himself by these assaults, he would fly across the table to Mary, and in a moment assume a different character. He would begin his little song, his head and tail keeping a sidelong motion to the tune; he would sit on her shoulder, and rub himself against her neck or face, as if he scarcely knew how to show all the fondness he felt for her. Sometimes the mere sound of Anne's voice would impel him to renew his hostile attacks against her; and, leaving Mary, he would fly again to Anne, like a little fury. Many were the attempts made to deceive him, by the sisters changing their seats, but he quickly discovered the imposition. The only thing which ever deceived him was when Mary threw a handkerchief over her head; he then, for a moment, mistook her for a stranger. From some cause his claws became diseased, and at last dropped off; so that he could no longer grasp his perch. He was therefore obliged to remain on the floor of his cage: still, in other respects, he appeared to be in perfect health, and the beautiful state of his plumage, always bright and smooth, not a single feather ruffled, was a proof of this. In all probability he would have lived much longer, had it not been for the inconsiderate deed of some little boys who were visiting Mrs. F. They had often been warned not to frighten the Bullfinch. But one day, when he had quitted his cage, and was enjoying the free range of the sitting-room, these little boys, seized by one of those sudden impulses which often hurry lively children into thoughtless acts of disobedience, sprung from their seats, and before any one could stop them, chased the poor bird round the room, till he dropped down quite exhausted. He was immediately taken up, and his feet put into warm water, in the hope of restoring him, but in vain. His delicate frame could not sustain so rude a shock, and the pet Bullfinch was no more. Every one lamented that his last moments should have been rendered so unhappy; and it will readily be believed that the death of so interesting a bird was sincerely regretted. Tears were shed for his loss, and an honourable place of sepulchre appointed for him, at the foot of a cedar on the lawn.

Poetry.

[In Original Contributions under this head, the Name, real or assumed, of the Contributor, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE DYING FATHER TO HIS DAUGHTER.¹

To me, my sweet Kathleen, the benahee has cried,
And I die,— ere to-morrow I die;
This rose thou hast gather'd and laid by my side,
Will live, my child, longer than I.
My days, they are gone like a tale that is told—
Let me bless thee, and bid thee adieu;
For never to father, when feeble and old,
Was daughter so kind and so true.

Thou hast walk'd by my side, and my board thou hast spread,
For my chair the warm corner hast found;
And told my dull ear what the visitor said,
When I saw that the laughter went round.
Thou hast succour'd me still, and my meaning express'd,
When memory was lost on its way;
Thou hast pillow'd my head when I laid it to rest;
Thou art weeping beside me to-day.

O Kathleen, my love, thou couldst choose the good part,
And more than thy duty hast done:
Go now to thy Dermot, he clasp'd to his heart—
He merits the love he has won.
Be duteous and tender to him as to me;
Look up to the Mercy-seat then;
And passing this shadow of death which I see,
Come, come to my arms back again.

Professor Smyth.

THE STORM.

SOFT be thy sleep, my darling child,
Thou dream'st not of the tempest wild,
That strips the garden of its flowers,
And even the knotted oak o'erpowers.
The heavens are like the ocean, dark;
The clouds are driven like shatter'd bark;
The lightning-flash dissolves the rock;
Earth reels beneath the thunder's shock.
Sweet image of a tranquil mind,
Thou hearest not the howling wind;
The bliss of heaven is in thy dream;
Thy smile is evening's placid beam;
The tempest's soften'd to a song,
Echoing th' angelic host among;
The rolling thunder's awful roar
Seems but the dance that shakes the floor.
Thou seest not the yawning tomb
Where many a pale lip shuts in gloom:
The lightning's flash ne'er startles thee,
Thou sleep'st in sweet tranquillity,
While o'er thee bends thy mother's arm
To guard her darling child from harm.
She wraps thee round, and cradles thee,
And whispers many a prayer for thee;
She knows that flowers are weak and frail,
And perishes 'neath the sweeping gale:
Already o'er her head it's past,
With woe and weeping on its blast;
For many a treasure'd hoard it stripp'd,
And many a budding joy it nipp'd.
From earth and time, far, far above,
To God she turns in faith and love,
Who with a father's heart beholds,
And in His arms His children folds.
'Tis this that, while the tempest sweeps,
Her heart in calm composure keeps;
She knows that God is watchful still
To guard His children from all ill.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

DIALOGUE IN AN AMERICAN STAGE COACH.

(The speakers are strangers to each other.)

"WHERE are you going? Middle on?" "Yes."
"Do you keep at Boston?" "No."
"Where do you keep?" "Fairfield."
"Have you been a lengthy time in Boston? eh? say."
"Seven days."
"Where did you sleep last night?" "— Street."
"What number?" "Seven."
"That is Thomas Adonis —'s house?" "No. It is my son's."
"What, have you a son?" "Yes; and daughters."
"What is your name?" "William Henry —, I guess."
"Is your wife alive?" "No, she is dead, I guess."
"Did she die sick right away?" "No, not by any manner of means."
"How long have you been married?" "Thirty years, I guess."
"What age were you when you were married?" "I guess mighty near thirty-three."
"If you were young again, I guess you would marry earlier?" "No; I guess thirty-three is a mighty grand age for marrying."
"How old is your daughter?" "Twenty-five."
"I guess she would like a husband?" "No; she is mighty careless about that."
"She is not awful (ugly), I guess?" "No; I guess she is not."
"Is she sick?" "Yes."
"What is her sickness?" "Consumption."
"I had an item of that. You have got a doctor, I guess?" "Guess I have."
"Is your son a trader?" "Yes."
"Is he his own boss (master)?" "Yes."
"Are his spirits kedge (brisk)?" "Yes, I expect they were yesterday."
"How did he get in business?" "I planted him there. I was his sponsor for a thousand dollars. I guess he paid me within time; and he is now progressing sick."—*Fearon's Sketches of America, published in 1818.*

CRUELTY to dumb animals is one of the distinguishing vices of the lowest and basest of the people. Wherever it is found, it is a certain mark of ignorance and meanness; an intrinsic mark, which all the external advantages of wealth, splendour, and nobility cannot obliterate. It will consist neither with true learning nor true civility; and religion disclaims and detests it as an insult upon the majesty and the goodness of God, who having made the instincts of brute beasts minister to the improvement of the mind, as well as to the convenience of the body, hath furnished us with a motive to mercy and compassion toward them very strong and powerful, but too refined to have any influence on the illiterate or irreligious.—*Jones of Nayland.*

THE MILLER'S NIECE.

A STORY OF CIRCUMSTANTIAL EVIDENCE.

It is not without a purpose that we translate the facts upon which the following strange story is founded, out of the dry records of legal processes into a more popular style. As, however, we have no wish to surround the facts of the tale with an array of fictitious decoration, in order to fill a given number of pages, we shall throw aside all the devices of romantic narrative, and relate a singular case of circumstantial evidence in a very simple way.

Near to the town of C—— (now a flourishing place of manufacture), in Yorkshire, there lived, in the last century, an old bachelor, who had thriven well as a miller. His name was John Smith; but he was generally known in his neighbourhood only by the title of "Old Johnny." He was a man of, at least, average honesty, not ill-disposed, very illiterate, and wholly devoted to worldly gain. Old Johnny was never seen at church: his mill was his place of worship. He was a sincere money-worshipper; and never attempted to disguise the fact by contributions to any charities or religious institutions. He considered it to be man's business to get money and to keep it; and, if any one failed to do so, he regarded him as an unfortunate fellow

or a simpleton. He said he could understand why the parson troubled himself about religion; it was his *business*, and every man ought to mind his business: but what had other people to do with it? This is almost all that we can learn of his character; but it is only fair to his memory to add, that some of the evidence before us shows that he could be sometimes kind to a neighbour, and that he was a good master. In person he was tall, stout, and good-looking. The house in which he lived was situated close behind his mill, on the bank of the river which flows at the foot of the hill on which the town is built. On that side of the stream, in Old Johnny's time, there were no other houses; but, within a stone-throw of his mill, on the side of the river nearer the town, there was a collection of cottages known by the name of Fording-place, and noted as a resort for vagabonds. About half a mile further up the river, there was a respectable house inhabited by Stephen Bracewell, an attorney, and his only son Richard, who belonged to the same profession. But to return to Old Johnny's house: it was one of those substantial stone-built farm-houses, with a large porch, low windows, and stone floors, which are still to be seen in many of the rural districts of Yorkshire and Lancashire. Within all was clean and bright, and bore witness to the fact, that though Old Johnny had never considered matrimony a profitable

business, he could appreciate the advantages of having a tidy housekeeper. The kitchen, where Old Johnny generally sat, was a spacious apartment, with a floor of flag-stones, well washed, scoured with sand-stone, and sprinkled over with sand every morning. In the capacious window-seat were some flower-pots. On a wooden rack, suspended from the ceiling, hung oat-cakes. Hams were hung in the chimney, and fitches of bacon lined the white-washed walls. Such was the apartment where Old Johnny would sit during the greater part of the Sunday when the mill was not going, requiring neither the solace of a pipe nor a book to help his meditation, and only giving, now and then, a slight symptom of ennui, by wishing to hasten on the heavy finger of the old clock towards the hour of dinner or supper. "Margaret," he would sometimes say, "I'm thinking again the auld clock must be losing time."

This brings us to the miller's niece, who presided over his domestic economy. Margaret was a sensible, shrewd, and well-domesticated young woman, the only relative of whom the old man took any notice, and had made herself seem indispensable to the miller's comfort by her good management of his household. In person she was of rather low stature and full womanly form, of a dark complexion, with good features, dark grey eyes, and dark brown hair, with a strong curl in it. There was only one point of disagreement between the miller and his niece, and this was in the encouragement which she gave to the addresses of Richard, the son of the attorney whom we have mentioned. Though Richard was a young man of good character, he had no great worldly prospects; besides, in some business which they had transacted together, Old Johnny had quarrelled with Stephen Bracewell. This, added to his dislike of losing a good housekeeper, made the miller violently opposed to the proposed match, and he never failed to show a discontented aspect when Richard had visited the mill. Besides this opposition, Richard had to encounter a rival candidate for Margaret's hand in a man of a very singular character. There lived a few woollen-weavers at Fording-place, and among them was a man rather beyond the middle age, of the name of Singleton. In some way he had acquired more knowledge than his neighbours; for he could read, and even write. He was a tall gaunt figure, with a meagre face, a high-crowned head, and eyes habitually turned upwards. His hopeless passion for Margaret, or some other cause, had impaired his intellect, and he excited the curiosity of his neighbours by the accounts of his "visions," which he committed to paper, and in which Margaret often, much to her own dissatisfaction, played the most prominent part. Though certainly crazy, he was frequently consulted as a medical adviser by his ignorant neighbours, and even by people who came from a distance for the purpose; for he was deep in all the mysteries of an old herbal, which told wondrous tales of the "starry influences" of Mars, Jupiter, Saturn, and all the other planets, upon medicinal plants.

In this collection of cottages there was one miserable old house, notorious throughout the neighbourhood as the resort of a gang of very disorderly characters. An old woman, of a most unfavourable aspect, with her daughter Nell, a stout bold-looking young termagant, were the tenants of this old building, in which they sheltered a party of vagabonds, of whom the two most notorious were known by the names of Will and Ned Crooks. A frequent visitor at this infamous abode was a young man of the most dissolute character, whose relatives kept a public-house in the town. He had, it appears, some independent property, which he consumed among the basest of companions in the practice of the lowest debauchery. There is nothing in the details before us to tempt us any further into the description of the set of characters implicated in our story.

Old John the Miller had frequently had serious disputes with the inmates of Nell Crooks' establishment on account of their inroads upon his property; and, at the

time when our story opens, he had threatened a prosecution against the brothers, Will and Ned, for stealing his poultry.

It was in the afternoon of a November day that young Nell made her appearance at the mill, to urge a petition, in behalf of her friends, that Margaret would persuade the "auld fellow" not to proceed with the prosecution. "The like o' him, wi' all his brass," said she, "to be making all this clatter aboot a coople o' fools! And the lad that stole them, if stolen they be, is far away out of the country, I'll warrant ye."

Margaret only answered that she should not interfere in the business at all; but that her uncle's patience was quite worn out by the numerous depredations made upon his property. Still the stout young advocate urged her petition,—"Well, let him keep his tongue aboot this then, and we'll never plague him mair. Wha'd be for setting a' the country after twa young lads for sic a thing as a bantam chick?"

But Margaret still persisted in her refusal, and, after trying in vain the force of a climax of entreaties, Nell had recourse to abusive and threatening speeches. "May be," said she, "there's that ye ken aboot, Mistress Margaret, that would fash the auld man far waur than his fools, gin he kenn'd it. And let them as meddles so much with ither's take care of their own business, like. There's master Richard,—I could say a thing aboot him ye wadna like to hear; but ye shall just find it out as ye may."

This insinuation called forth a very angry and indignant reply from Margaret, which only heightened the fury of the unhappy girl, who poured forth volley after volley of gross abuse, and retired at last across the ford, still shouting threats and imprecations, and shaking her fist violently towards the miller's house.

In the evening of the same day, both Margaret and her uncle went out to transact some little business with a man who rented a small piece of land belonging to the miller. The house of this little farmer was situated up in the fields, about half-a-mile distant from the mill. The path to it led along by the mill-stream, as far as a little copse, where the stream joined its parent river, from which it had been separated awhile that it might turn Old Johnny's wheel. Little did the old miller suppose, as he crossed the plank over his mill-stream, in good health and in good humour, except with regard to the stolen poultry, that he should never cross it again! At the farmer's house he drank, during his talk on business, rather more than his usual quantity of good ale; but, when he left the house, he flung aside the proffered assistance of Margaret's arm.

"Nay, lass," said he, "I can find my way to the mill, I'll warrant ye, without being led like a bairn."

The night was misty, and Margaret frequently lost sight of her uncle's figure, as he walked a few yards in advance; but he now and then declared his presence by breaking forth in some half-tipsy ejaculation:—"I'll clear the neighbourhood of the thieves,—and of the lawyers too! Mind thee, Meg, if I catch Master Richard at the mill again, if I don't clout him!"

About half-past nine o'clock Margaret arrived at home, and immediately asked the servant-maid if her uncle had not just entered the house, when the housekeeper answered "No;" but added, that a young man had shortly before crossed the mill-stream, and gone over the ford. The niece expressed some surprise, but said that her uncle must be somewhere about the premises, and would soon be coming in. Half an hour passed away, and then a footstep was heard in the porch.

"That is not the master," said the servant-maid.

"No," said Margaret, "it is Richard Bracewell," as she rose and opened the door for her visitor.

Shortly afterwards the servant-maid left the house, professing to feel great anxiety on account of her master's non-appearance. She did not enter the house again until Richard Bracewell had departed. When she came in, Margaret asked, "Have you seen my uncle?"

"No," replied Susan.

"Then have you seen Master Richard Bracewell?"

"No," said Susan.

"Strange!" exclaimed Margaret; "for he has just left the house to search for my uncle."

"Then he has not crossed the ford," said Susan, "for I have only just now come over."

"But what should you be doing on the other side of the river?" said Margaret.

"Why, looking for my master, to be sure," the girl replied.

"Why should you think he had crossed the ford?" said Margaret.

"Nay, gracious Heaven only knows where he is," said the girl, with a confused look.

We pass over the further conversation at the mill as the night wore on, and the master of the house did not appear, and turn our attention to another scene.

In introducing the reader to the conversation which took place at Nell Crooks' house on the evening of the miller's mysterious disappearance, we shall omit all the gross expletives and interjections with which the heroes who frequented this den of vice thickly strewn their remarks, and only give the substance of their speeches, which is necessary to explain our story.

"Then you protest and swear to me, Ned Crooks, that you have not seen Will Naylor this day?" said Nell the younger, (who, by the bye, was *not* the daughter of the old woman who kept the house.)

"I have not set eyes upon the man this day," said the individual addressed.

"And you tell me that this young limb of the law is on the look-out after him? What should that be for?"

"Nay, I have business enough of my own to look after," said Ned; "but this much I can tell ye, young Bracewell has been after him all this day, and called at the Black Dog for him this evening. You know Will is in debt all over the town, and it's not bad to guess what business a lawyer has with him."

Here followed several violent execrations on the whole tribe of lawyers, magistrates, and prosecutors, with which we need not garnish our pages.

"And what did the lawyer say to Will, at the Black Dog?" Nell asked.

"Why he asked after Naylor, to be sure; but Will would know nothing of him."

"I'll tell ye what," exclaimed Nell, with great violence, "I've done more, and put up with more, for that Will, than for any man alive; but if he has laid a finger upon Naylor, I'll sing out, as sure as I'm a woman!"

"You'll hold your noise,—that you will," answered Ned, with equal violence; but he added, in a softer tone,—
"Is it likely Will would be such a fool as to touch Naylor? What good could that do him? Is it not enough to account for Naylor's being shy, when this young limb o' the law is hunting the country for him?"

This turned the violent execrations of the girl again upon young Bracewell, and she was in the midst of a violent denunciation of the brood of lawyers, when Susan, the servant at the mill, burst into the room.

"What's the matter, Suky?" said Ned; "has your young jade of a mistress turned you out of doors this misty night?"

"No,—that's not it," said the girl, in breathless agitation; "but something's up at the mill."

"Ha, ha!" exclaimed Nell, fiercely; "the mistress is in trouble, is she? I told her something would come upon her this very afternoon."

"Nay, I don't know as mistress is in trouble," said the girl, with a knowing look; "she takes it very coolly to be sure; but master is lost!"

"Master lost! how? when?" exclaimed Ned.

"Nay, how I can't say," replied the girl; "but there it is. He went out and hasn't come home yet."

"Went out? where? Did he go alone?" Ned asked in a breath.

"Well, not a word must you breathe to a living creature," said the girl; "but here it is. About six o'clock he went out with mistress, to call on old Rob Wilkinson, I believe, and about ten minutes since, in comes mistress all alone, and asks me if I'd seen master. I told her 'No.' Then she sits down coolly till somebody comes to the door. 'That isn't uncle,' says she, 'it's Richard Bracewell,' and so she goes to the door, and he comes in, looking tired and flushed-like; and there I've left them, just now, sitting together. But say not a word about it. There's something up, as I guess, and now I must be off; for she never sent me to look after master."

So saying, the girl left Ned and Nell to moralize on the news she had brought.

For three days no tidings were heard either of the dissolute Will Naylor, or of the old miller; and all the neighbourhood was full of excitement about these mysterious disappearances. We need not relate the conduct of Richard Bracewell and Margaret at this time, as it will be told in the sequel. The excitement of the people rose higher, when it was observed that Will Crooks was also missing. But on the evening of the third day the whole neighbourhood was amazed by a singular incident.

Jonas Singleton, the crazy weaver, was in the habit, when his work was done, of taking a walk in the fields over the ford, (no matter what the weather might be,) either for the purpose of seeing "visions" (as he called his hallucinations), or of collecting medicinal herbs at the proper conjunction of the planets, or at the right age of the moon. This subserviency to some imaginary laws of nature, or impressions upon his imagination, was characteristic of his mental infirmity. He frequently returned from one of these rambles with a long story of some "vision" he had seen in the fields, and in which realities and strange fancies were most curiously intermingled. Accounts of these "visions" he would write out in a fair legible hand; then throw them aside and soon forget them, or give them to the first person who asked him if he had any "new visions!" Sometimes he would put one of his papers into the hand of a child, telling him to give it to his father, and saying, "there is something in it which concerns him." He also had frequently sent his papers through the hands of Susan to her mistress, until Margaret had forbidden the girl to receive any more of them. It was a curious circumstance, that he generally prefaced these visions with a statement of the exact spot on which he stood, and of the quarter of the heavens towards which his face was turned. Thus he would begin—"Standing in the west corner of the miller's field, near the copse (where the cuckoo-pint flourishes), moon in her first quarter—hazy weather—face south-south-west—I saw," &c. Though he wrote down these "visions" with all possible solemnity, he must have had some lurking sense of their unreality, as he betrayed no emotion even when he had seen "burials of his neighbours," &c. He seldom communicated any of his visions in any other way than by writing, and, as the whole neighbourhood was accustomed to his marvellous stories, if he had reported that he had discovered a chest of gold in the field, nobody would have run to look after it. But, on the evening of the third day after the miller's disappearance, this eccentric visionary returned from his usual ramble with an altered demeanour, excited and perturbed, so that he could hardly speak articulately. He seemed to have made some discovery which urged him to speak, and, when his strange conduct had excited the curiosity of some neighbours who gathered round him, he burst forth with a revelation which astonished all present. "In the corner of the miller's field," said he, "just where the mill-stream flows by the copse, there lies in the water the body of old John Smith. Why he lies there, Mistress Margaret must tell; or, perhaps, Master Richard Bracewell may be able to give some information upon it, as he is a lawyer."

This sounded like a reality, and several of the hearers ran immediately, in the greatest excitement, to the place specified, and found that Singleton had, for once, seen nothing more than the fact. There, in the mill-stream, darkly shaded by overhanging boughs, lay the swollen corpse of the miller. The face was livid, and there were marks of bruises upon the temples.

By this time, the magistrate had heard of the occurrence, and issued orders that the body should be conveyed to a room beneath the town-hall. The coroner's inquest sat upon it the next day, and a verdict was returned, "Found in the mill-stream at the foot of the miller's field; but how the deceased came there, the jury cannot say."

Meanwhile, great excitement was felt throughout the neighbourhood, on account of the continued absence of Richard Bracewell, Will Crooks, and Will Naylor. At Fording-place the "visions" of Singleton and the insinuations of Nell had worked up the people to such a fury against Richard Bracewell and Margaret, that the latter was hardly safe in the mill; and, accordingly, Mr. Bracewell, the elder, gave her shelter in his house. This only increased the popular rancour, and many said this was too barefaced!

To gain an insight into the progress of the plot, we must again condescend to enter the habitation of Nell Crooks. Young Nell had secretly left the house; and Ned was conversing with the old woman on the probable consequences of her departure. "That girl," said he, "has got the devil in her about Will Naylor, and she will not care if she says as much as may stretch our necks."

Old Nell replied, by execrations poured forth upon Will Crooks, Will Naylor, and the girl. But we need not write out the details of the conversation which followed.

Meanwhile, the "visions" of Singleton continued to excite popular curiosity, and several of his papers were circulated in the town. We may give a specimen of these inimitable productions; for though they did not furnish any legal evidence against Margaret and Bracewell, they perhaps hastened the interference of the magistracy, by the clamours which they raised against the unhappy individuals among the people. Here follows a verbatim copy of one of these documents:—

"I, Jonas Singleton, do hereby solemnly declare as follows:—I was standing in the low, west corner of the miller's field, on the evening of the 12th of November—weather very hazy—face south-east—near the copse where the mill-stream runs into the river. (N.B.—there is *devil's bit* growing about the copse—this plant, if you pull it up, you will see that a part of the root is always bitten off; and it is said that the devil, being envious of its great virtues in certain diseases, did bite off the same, and from this it has its name.) I saw old Rob Wilkinson walking across the pasture, and he came up to me and said, 'That was an unlucky night for Old John.' Then I said, 'Who will be the heir to the property?' and he said, 'You must ask lawyer Bracewell; for he has the will.'—Vanished!—Then Margaret came out of the copse, and I said, 'This is a bad business about your uncle, Margaret,—you should have nothing to do with young lawyers.' Then she said, 'Hush! or he will hear you!' and, just then, young Richard Bracewell came out of the copse, holding a large stick in his hand, and told me to say nothing of what I had seen.—Vanished!—"

It is worthy of remark, that so great was the credulity and rashness of the common people, that, although this man had brought home a hundred stories of men whom he had seen dead, while they were alive and well, and of other unreal wonders, yet they attached great importance to his revelations respecting the old miller's death, and even began to cry out, that it was a shame such wretches as Margaret and Bracewell were allowed to be at liberty.

On the 14th day of November, Richard Bracewell returned, wet and weary, late in the evening, to his

father's house. When this became known, and it was also circulated by the zealous Susan, that Mr. Bracewell had ransacked all the chests and drawers at the mill, and that Margaret had taken with her several valuable articles, popular indignation knew no bounds. A new excitement was raised when Will Crooks, on the following day, reappeared at the house of old Nell. His first question was if master Bracewell had returned, and this was soon answered by the entrance of the person in question, attended by his father.

"Now, Will Crooks," said the younger Bracewell, "I wish to ask you, for the last time, if you can tell me anything of Naylor?"

"Get out of the house, you villains, that have lived by the law, and yet will die on the gallows!" screamed old Nell.

Will Crooks refused to utter a word respecting Naylor, and told Bracewell to look to his "own business," which was "ugly enough."

Further altercation was prevented by the entrance of the officers of justice, who at once apprehended all the parties present, on suspicion of having been concerned in the death of John Smith, and the disappearance of William Naylor.

In the morning of the same day, young Nell had laid a statement before the magistrate, that, on the evening of the miller's disappearance, young Bracewell had been drinking with Will Crooks at the Black Dog, and that both left the house together, about half-past eight o'clock. She had also repeated all that Susan had told of the conduct of her mistress on that fatal evening. On these grounds a warrant had been issued for the apprehension of the two Bracewells, Margaret, and Will Crooks. On the next day an examination of the prisoners took place. Mr. Bracewell the elder was liberated on bail, on account of the statement of his housekeeper, which asserted an *alibi*; but the others were sent to the prison, and fully committed to take their trial at the York Assizes.

Shortly afterwards, Ned Crooks, and the old mistress of the infamous establishment at Fording-place, were apprehended on suspicion. The prisoners were removed to York Castle, and placed in separate cells.

Meanwhile the rumour of the case excited the greatest curiosity throughout the country. Stories of Singleton's "visions" were circulated in such a magnified shape, that the crazy weaver gained the title of a prophet, and the coming trial was expected with great eagerness by people of all ranks in society. We only give a brief summary of the remarkable trial which was the result of these circumstances. The bills against Mr. Bracewell the elder, old Nell Crooks, Ned Crooks, and young Nell, were ignored; but true bills were found against Richard Bracewell, jun., Margaret Smith, and William Crooks, for having been concerned in the death of John Smith.

During the interval between the commitment and the assizes, Mr. Bracewell, senior, was actively engaged in collecting witnesses for his son and Margaret Smith. Richard determined to conduct his own defence.

(To be continued.)

THE TEES AND ITS POETICAL ASSOCIATIONS.

(Concluded.)

O Brignal banks are wild and fair,
And Greta woods are green,
And you may gather garlands there,
Would grace a summer queen.

SIR W. SCOTT.

HAVING traced the course of the beautiful river Tees until it arrives in the vicinity of Barnard Castle,¹ we are tempted to linger awhile on those enchanted grounds, which furnished to the poet above quoted the groundwork of his beautiful poem of "Rokeby."

(1) See Illustration, p. 369.

Barnard Castle was built by Barnard, son of Guy Baliol, who came into England with the Conqueror, and who, in the reign of his successor, William Rufus, became possessed of the forests of Teesdale and Nardwood, with the lordship of Middleton in Teesdale and Gainford. The site chosen for the castle was on a cliff overhanging the Tees, and here a stately edifice was raised, which Barnard made the head and seat of his barony, and called by his own name. Around it the peasants and retainers gathered, and a borough and market town arose under shelter of the castle and of its powerful barons. "The Castle of Barnard stoneth stately upon Tees," says Leland, and in the time of its prosperity, it must indeed have been a stately building, though the present ruins convey but a faint idea of its former importance.

The castle remained in the possession of the Baliol family until the year 1296, when its proprietor, John Baliol, who had been crowned King of Scotland in 1292, forfeited his English estates, and the castle and honour of Barnard were conferred on Guy Beauchamp, Earl of Warwick. After this the estates fell into various hands, and the castle on one occasion sustained a siege of eleven days. In 1630 the fortress was unroofed and dismantled, and subsequently to this date remained in a ruined and deserted condition. The present remains are scattered over nearly seven acres of ground; the most massive portions being at the edge of the cliff, about eighty feet above the river, and commanding a most beautiful prospect. There are poetical associations connected with various objects in the landscape; and the face of nature, whether in its cheering or more sombre aspect, recalls some passages of "Rokeby."

"The moon is in her summer glow,
But hoarse and high the breezes blow,
And, racking o'er her face, the cloud
Varies the tincture of her shroud;
On Barnard's towers, and Tees's stream,
She changes as a guilty dream,
When conscience, with remorse and fear,
Goads sleeping Faucy's wild career.
Her light seems now the flush of shame;
Seems now fierce anger's darker flame;
Shifting that shade, to come and go,
Like apprehension's hurried glow;
Then sorrow's livery dims the air,
And dies in darkness, like despair.
Such varied hues the warder sees
Reflected from the woodland Tees.
Then from old Baliol's tower looks forth,
Sees the clouds mustering in the north,
Hears upon turret-roof and wall,
By fits the plashing rain-drop fall,
List to the breeze's boding sound,
And wraps his shaggy mantle round."

The chief remaining erections of Barnard Castle are arranged in an almost circular area, and are of different ages. One portion of the walls is of comparatively modern and superior architecture, supported by strong buttresses and defended by a square turret; another portion is very ancient and thick, and has been strengthened by oaken beams, disposed in tiers in the centre of the wall at equal distances, so as to render it firm against battering engines. In the north-west corner of this area is a circular tower of an excellent ashlar masonry, having a vault, the roof of which is plain, without ribs or centre pillar. This vault is thirty feet in diameter, and the stairs leading to the upper apartments are channeled in the wall. Adjoining this tower were the state apartments and principal lodgings. The scenery of the neighbouring grounds has been well described by the author of a "Tour in Teesdale," as follows:—"When you reach the tangled dell at the end of the terrace, (the flats), wind down a small track to the rivulet, and take the road through a fine hanging wood, by the Tees side, to a small inclosure, part of an ancient park, in the true character of Shakespeare's forest scenes, where his outlaws revel and his fairies sport; keep the river, and you will

gain a most truly solemn and sequestered spot, completely closed in by wood, and undisturbed by any sound, save the remotely dashing water. The wild forms of the venerable oaks that skirt the old moss-covered wall of the enclosure; the noble height of the opposite hill, covered to the summit with lofty trees; the glassy smoothness of the river at your feet; and the scattered masses of rock in its channel, impress you with delicious awe. Ascend the hill, and go through a ploughed field, along a carriage road, to a thatched holm shed in a little wild coppice, (in themselves a pleasing picture,) and you will enjoy a most enchanting scene; but seek for a small oak beyond, near a serpentine path, rather below the summit of the hill, on the brow of the river, and you command at once a view each way. I shall not pretend to describe it; the pen and pencil must alike fail."

The Church of Barnard Castle need not detain us, except to notice the monumental inscriptions, to the memory of the infant children of John Rogers, A. M. That on the first born, named Jonathan, who died Nov. 8th, 1650, runs thus:—

"Hee peep'd into the world, where he could see
Nought but confusion, sinne, and misery;
Thence scap'd into his Sav'or's arms; thus he
Gott heaven for fourteene dayes' mortality."

The following is to the memory of the second son, named John, who died August 30th, 1652:—

"Bles'd soule, thy name did minde of God's grace,
Thou wast his gift, whose love shew'd us thy face;
But Hee that gave did take; in yon moneth's space
Thou found'st in Father's armes a resting place."

Let us now follow the footsteps of those who took their way from the castle—

"While misty dawn and moon-beam pale
Still mingled in the silent dale,
By Barnard's bridge of stately stone
The southern bank of Tees they won;
Their winding path then eastward cast,
And Eglistone's grey ruins past."

The ruins of Eglistone Abbey, or Priory, are beautifully situated on the high cliffs of the Tees, at an angle formed by the little dell of Thorsgill, at its junction with the river. At this spot were formerly marble quarries of some value; for Leland says, "Hard under the cliff, by Egliston, is found, on each side of Teese, very fair marble, wont to be taken up both by marblers of Barnard's Castle and of Egliston, and partly to have been wrought by them, and partly sold, unwrought, to others." Part of this abbey is still entire, and used as a dwelling; but the church connected with it is in ruins, and helps to produce the picturesque scenery of Rokeby.

"'Twas a fair scene! the sunbeam lay
On battled tower and portal gray,
And from the grassy slope he sees
The Greta flow to meet the Tees,
Where, issuing from her darksome bed,
She caught the morning's eastern red,
And through the softening vale below
Roll'd her bright waves in rosy glow."

The ravine through which the Greta flows, yields such a powerful charm to the scenery of Tees, that we cannot forbear to describe it in the words of the gifted author of "Rokeby." Speaking of the glen through which the Greta finds a passage, between Rokeby and Mortham, the former situated on the left bank of Greta, the latter on the right bank, about half a mile nearer to its junction with the Tees, he says, "The river runs with very great rapidity over a bed of solid rock, broken by many shelving descents, down which the stream dashes with great noise and impetuosity, vindicating its etymology, which has been derived from the Gothic *Grídan*, to clamour. The banks partake of the same wild romantic character, being chiefly lofty cliffs of limestone rock, whose grey colour contrasts admirably with the

various trees and shrubs which find root among the crevices, as well as with the huc of the ivy, which clings around them in profusion, and hangs down from their projections in long sweeping tendrils. At other points the rocks give place to precipitous banks of earth, bearing large trees, intermixed with copsewood. In one spot the dell, which is elsewhere very narrow, widens for a space, to leave room for a dark grove of yew trees, intermixed here and there with aged pines, of uncommon size. Directly opposite to this sombre thicket, the cliffs on the other side of the Greta are tall, white, and fringed with all kinds of deciduous shrubs. The whole scenery of this spot is so much adapted to the ideas of superstition, that it has acquired the name of *Blockula*, from the place where the Swedish witches were supposed to hold their Sabbath. The dell, however, has superstitions of its own growth, for it is supposed to be haunted by a female spectre, called the Dobie of Mortham. The cause assigned for her appearance, is a lady's having been whilom murdered in the wood, in evidence of which, her blood is shown upon the stairs of the old tower at Mortham. But whether she was slain by a jealous husband, or savage banditti, or by an uncle who coveted her estate, or by a rejected lover, are points upon which the traditions of Rokeby do not enable us to decide."

The ancient castle of Rokeby no longer gives dignity to this romantic scene; but we may subjoin the poet's description of the castle, on Wilfred's approach to it by moonlight:—

"Now, through the wood's dark mazes past,
The opening lawn he reached at last,
When, silvered by the moonlight ray,
The ancient Hall before him lay.
Those martial terrors long were fled,
That frown'd of old around its head:
The battlements, the turrets grey,
Seem'd half abandoned to decay;
On barbican and keep of stone
Stern time the foeman's work had done;
Where banners the invader braved,
The hare-bell now and wall-flower waved;
In the rude guard-room, where, of yore,
Their weary hours the warders wore,
Now, while the cheerful faggots blaze,
On the paved floor the spindle plays:
The flanking guns dismounted lie,
The moat is ruinous and dry,
The grim portcullis gone—and all
The fortress turned to peaceful hall."

Mortham Tower is about a quarter of a mile distant from Greta bridge, and still looks very picturesque, though now surrounded by the buildings of a farm. The battlements are singularly elegant in appearance; being broken, at regular intervals, into different heights; while, at the corners of the tower, they project into angular turrets. At some distance from the tower is placed, between the trunks of two magnificent elms, an immense tomb of Greta or Tees marble, which is said to have been brought from the ruins of Eglstone Priory. It is richly carved with armoury, and appears to have been a monument to the family of the Fitz-Hughs. The appearance of this tower, as approached by Wilfred and Bertram at early morn, is thus sketched in "Rokeby":—

"But morning beam, and wild bird's call,
Awaked not Mortham's silent hall.
No porter, by the low-brow'd gate,
Took, in the wonted niche, his seat;
To the paved court no peasant drew,
Waked to their toil no menial crew;
The maiden's carol was not heard,
As to her morning task she fared;
In the void offices around,
Rung not a hoof, bayed not a hound,
Nor eager steed, with shrilling neigh,
Accused the lagging groom's delay;
Untrimm'd, undressed, neglected, now,
Was alley'd walk and orchard bough;

All spoke the master's absent care,
All spoke neglect and disrepair.
South of the gate an arrow-flight,
Two mighty elms their limbs unite,
As if a canopy to spread.
O'er the lone dwelling of the dead;
For their huge boughs in arches bent,
Above a massive monument,
Carved o'er in ancient Gothic-wise,
With many a scutcheon and device:
There, spent with toil, and sunk in gloom,
Bertram stood pondering by the tomb."

From Barnard Castle the course of the Tees is tolerably direct, until it reaches the neighbourhood of Darlington; but it is still full of picturesque beauties. The parish of Gainford, including its dependent chapelries, stretches nearly eighteen miles along the Tees, and presents rich and pleasing scenery. The village of Gainford stands in the middle of the river-vale, surrounded, on the Durham side, by fertile meadows and well-wooded enclosures, sloping gently to the Tees. The grounds on the Yorkshire side rise rapidly, crowned and skirted by scattered woods. About a mile from Gainford is Snow-Hall, one of the loveliest spots in the vale, situated on swiftly-rising ground, with rich pasturage in front, and bounded by a sweep of the Tees. The surrounding grounds are very picturesque, being richly sprinkled with hedgerows of lofty ash, and oak, and elm, and with a luxuriant growth of native holly. Further on are the house and grounds of Selaby, the latter covered with beautiful forest trees, and falling rapidly to the river. There is a thick undergrowth of thorn, and holly, and hazel, and from the lower portion of the wood, a small sparkling stream issues forth, to pour its waters into the Tees. On the Durham side is the parish of Winston. Winston itself is a small village, of one street, on a high ridge close to the Tees, and surrounded with the softest and most lovely scenery. A fine bridge of one arch crosses the river immediately below the village. The Parsonage commands one of the richest and most beautiful views on the Tees. "The river washes the foot of the steep wooded bank, and forms a long silvery canal, till it is lost among the woods and cliffs of Selaby and Gainford." Surtees, the historian of Durham, describing this lovely spot, gives, in a note, the remark, that a rector of Winston should never make an offer of marriage to a lady who has seen this enchanting spot, because he could never be sure that she did not marry the situation. He adds, "Were I counsellor to the Bishop of Durham, the rector of Winston, without derogating from qualities essentially clerical, should always be a gentleman of somewhat elegant and delicate mind, capable of valuing the beauties of wood and water, and deriving from the very possession of such a spot a gentle and honourable feeling of content and independence."

Next to Winston comes the parish of Whorlton, whose pretty village of that name occupies a level plot near the brink of the river cliffs, which are abrupt, and shaggy with native wood, and interrupted by projecting masses of rock. This village commands an extended view over Yorkshire. Thorp-on-Tees, surrounded by rich level pastures, is in front; to the south, and in the depth of the vale, stands the manor house, church, and parsonage of Wycliffe, warm and sequestered on the water's edge. Westward the view ranges over the dusky romantic woods of Mortham and Rokeby.

During this part of its course, the Tees receives from its left bank the waters of a river called Staindrop Beck, which is ten or twelve miles long, and flows through Raby Park and past the town of Staindrop, receiving the waters of the Forth or Sut Beck.

The next point of interest on the Tees is Hurworth, a beautiful village scattered along a steep bank above the Tees on the Durham side, and commanding a rich though bounded landscape to the south, where a wide and fertile plain is washed by the river, and the sudden rise of the Yorkshire hills closes in the prospect. The

church of this village stands immediately on the brink of the river bank. At Hurworth lived and died the great and self-taught mathematician, William Emerson, for many years an unknown contributor to the *Ladies' Diary* under the signature "Merones," until a transposition of the letters disclosed his name.

One mile to the east of Hurworth is the village of Tresham, close upon the Tees, and near a broad safe ford. "From Hurworth to Tresham," says Surtees, "the river twice forms a broad silvery canal; then shooting swiftly southwards, sweeps round the soft green plain of Lockton, and turning again to the north, washes the quiet fields and wooded banks of Dinsdale, and once more making a deep reach beneath the village of Middleton, glides softly away past Middleton-hall to Worsall ford. * * No fairer spot could attract the Norman soldier, and nowhere were his descendants more likely to transmit their possessions in deep hereditary peace. The knights of the Tees might mingle in the border warfare; but the bugle horn of an assailant would seldom startle the inmates of their quiet halls. The sale of the estates to wealthy families already possessed of hereditary seats, has occasioned, within the last century, the desertion of these ancient halls and quiet fields, which now breathe a spirit of yet deeper retirement."

Describing the above district, Michael Drayton writes thus:—

[*Tees loquitor.*]

"Then do I bid adieu

To Bernard's battell'd towers, and seriously pursue
My course to Neptune's court; but as forthright I runne,
The Skerne, a dainty nymph, saluting Darlington,
Comes in to give me ayd, and being proud and ranke,
She chaunc'd to looke aside, and spieth near her banke,
(That from their loathsome brimms do breathe a sulphurous sweat)
Hell-kettles rightly call'd, that with the very sight,
This water-nymph, my Skerne, is put in such affright,
That with unusual speed she on her course doth haste,
And rashly runnes herselfe into my widened waste.

The waters of the river Skerne fall into the Tees near Darlington. The poet fancifully ascribes the accelerated speed of the waters, which is observable near Darlington, to the fright of the Skerne at observing a natural phenomenon well known to the inhabitants of that neighbourhood.

Between Darlington and the Tees there are four round pools, popularly called *Hell-kettles*. The three largest, which are near each other, are nearly one hundred and twenty feet in diameter, and in depth, nineteen, seventeen, and fourteen feet respectively. The fourth, which is at some distance, is only twenty-eight feet across, and five or six deep. In all of them the water stands to the brim, and is quite cold, but impregnated with sulphur, curdling with milk, and refusing to mix with soap. It was once supposed that there was a subterraneous communication between these pits and the river Tees; but, as the water in the pools is never affected by any floods or variations of that river, the conjecture seems to be without foundation. Darlington stands in a rich and fertile country, and is a place of considerable trade.

Adjoining the parish of Darlington is that of Conscliffe. High Conscliffe stands on the brink of a long stretch of limestone rocks, which have been wrought and quarried to the very walls of the houses. The church with its cemetery is almost insulated by these deep workings, and its tower and spire are seen from a distance rising over perpendicular cliffs which glitter in the sun "like the white walls of some giant fortress."

The Tees does not receive any considerable affluent after the Skerne, except the Leven from Yorkshire, which falls into the Tees below Yarm.

Hitherto, the banks of the Tees have exhibited the most picturesque features, especially on account of the rocky nature by which they are often characterised. But towards Yarm they become flat and low: so much

so, indeed, that the town is subject to destructive floods, which check its prosperity. Yarm is a parish and market town in the North Riding of Yorkshire. The town is seated on a low peninsula, nearly surrounded by the Tees. The river is crossed by a bridge of five arches, built in 1400, by Walter Skirlaw, Bishop of Durham.

If the Tees, as it approaches Yarm, has lost much of its romantic character, it has the compensating quality of usefulness. The influence of the tides may here be perceived, and the navigation, by means of barges, is briskly carried on. But larger vessels find difficulty in ascending beyond Stockton, on account of two rocks in different parts of the stream, which greatly oppose their progress. In its course to Stockton (which is four miles from Yarm, on the opposite bank), the Tees spreads itself forth into a broad and important river, until it at length becomes a fine harbour for shipping.

Stockton upon Tees is situated near the confluence of the Tees with the German Ocean. At Stockton there was anciently a castle, or strong moated mansion, the residence of the Bishops of Durham, the moat of which is yet visible on three sides of the site, the river protecting the other side. No remains of the building are now standing, except an original buttress, which lately supported some farm buildings occupying the site.

During the civil wars this castle was a place of some importance, and was, for a considerable time, a place of garrison for the king's forces. At length in 1646 it was resolved by the parliament "that Stockton Castle be made untenable, and the garrison disgarrisoned;" and again, in 1647 the decree was confirmed thus,—"*Resolved, that the house doth concur with the Lords, that the works about Stockton Castle made since these troubles, be slighted and dismantled, and the garrison disgarrisoned.*" Thus Stockton Castle did not fall a sacrifice to the ravages of time, but to the distracted state of the kingdom. It fell into the possession of private individuals, who demolished it for the sake of the materials. Several stone houses still existing in Stockton were built of these materials.

The manor of Stockton constituted a portion of the see of Durham, as early as the Roman conquest. At the Reformation, however, Stockton itself was a village so despicable, that "the best house in it could scarcely boast anything better than clay walls and a thatched roof." Camden, writing in the time of Queen Elizabeth, entirely overlooks this town, although he gives a particular account of the river Tees. "Beyond Darlington," he says, "Tees hath no townes of any great account standing upon it, but, gliding along the skirtes of green fields and by country villages, winding in and out as he passeth, at length dischargeth himself at a large mouth into the ocean, whence the base and botham of the triangle towards the sea beginneth." Stockton was then in a state of such total declension as to be unworthy of notice, or it would not have been thus slighted by our authentic historian. Gradually, however, this town recovered its former prosperity, and advanced in commercial activity. Its prosperity was long checked by the difficulties connected with the navigation of the Tees, chiefly occasioned by the bend or winding of the river between two points, called Page's Point and Portwrack. Although the neck of the peninsula was only 120 yards across, the shore measured more than two miles. It had often been proposed to make a canal or cut through this peninsula, and at length it was carried into execution, to the manifest advantage of the town. This spirited act led to others, so that, at this time, the internal as well as the coasting communication with this port, is brought to great perfection.

Stockton itself is a neat and handsome town, stretching with an easy curve along the southern bank of the Tees. Over the river is a fine bridge of five arches, the central arch having a span of 72 feet. The town is situated on elevated ground, and, therefore, escapes injury at the rising of the waters of the Tees, from

which the opposite low shores of Yorkshire suffer so much. Our river has now entirely lost its wild and romantic character, no longer rushing over beds of rock, and forming innumerable cascades, or sending its deep and rapid waters in narrow but romantic channels: it now runs brimming through soft level lands, between low even shores, until, near the sea, it expands into a broad estuary three miles across. The mouth of this estuary is contracted by a tongue of land called Seaton Snook, whence a bar of sand extends to the Cleveland coast. During the spring tides, from ten to twelve feet of water is the depth on the bar at low water, and from twenty-six to twenty-eight at high water, while in the neap tides the depth is twelve feet at low water, and twenty-two at high water. The bay of the Tees affords convenient shelter for shipping in boisterous weather.

Having thus brought our river to the termination of its course, it is time to notice its internal riches. These consist of excellent fish, *i. e.*, salmon, flounders, eels, smelts or sparlings, &c. The principal fishery in the river is that of salmon, which fish may be taken from the 22d of November to the 12th of August; though it is seldom attempted to be caught till April. The mode employed in this river is to take the fish with the large drag-net, which is used by all the fishermen till you come to the salmon-lock at Dinsdale. There is a great decrease in the quantity of salmon in this and other rivers of the North. The extension of lead mines, and the impregnated water issuing from thence, have been assigned as the probable cause of this. Salmon go up to spawn, as far as Barnard Castle, which is thirty miles above Dinsdale, and several miles above it, where the fishing ground begins. In April or May, after having had the advantage of feeding in the sea, the salmon begin to be rich and fat, and to ascend the rivers, and continue to do so all the summer. This is, therefore, the season for commencing operations. Salmon fisheries are let as private property in different parts of the river, as at Egglescliffe, near Stockton, at Yarm, Dinsdale, &c., a rent per boat being paid at each station.

Near the mouth of the Tees there is a fishery for cockles, which are gathered on ridges of sand left dry, at the ebb tide, near the middle of the stream. From hence many bushels of cockles are sent almost daily to Newcastle, York, Leeds, and other places. Shrimps are also taken on the shores of the Tees, by means of small hand-nets fixed upon a long pole. Large shoals of porpoises frequent the sand banks at the Tees' mouth, and are thought to be very injurious to the salmon and other fish.

The wild and romantic scenery of Tees sometimes tempts the visits of rare birds, while its secluded banks shelter a number of interesting plants. The golden eagle, and the rough-legged falcon, or buzzard, have been shot here. The Bohemian chatterer, the cross-bill, the grey phalarope, and other rare birds, are occasionally seen. Near the mouth of the river the yellow-horned poppy, the sea pearl-wort, the purple mountain milk vetch, and the bloody cranebill, are to be seen. The autumnal gentian, the bird's-eye primrose, the red flowered oxlip, the greater and lesser butterfly orchis, the frog orchis, the flowering rush, and numerous other floral beauties, also adorn the banks of this river.

THE HEARTH CRICKET.

Sounds inharmonious in themselves and harsh,
Yet, heard in scenes where peace for ever reigns,
And only there, please highly for their sake.

COWPER.

Do we not find in the above lines the reason why the song of the cricket is to many persons so pleasant and enlivening? That song has been heard by their own fireside, in the happy season of their youth, and it calls up sweet remembrances of by-gone days, true-hearted

friends, and innocent delights. It is connected with the sacred name of *Home*, and therefore speaks of peace, love, and enjoyment. That song was a song of wonder to them in their childish days. It came from a mysterious being, always hiding from their sight, and eluding their strictest search. It seemed now here, now there, beneath their feet, close at their ear, or ringing from the very centre of the glowing hearth. It was at times a strange, almost supernatural sound; for, in the stillness of night, when the lone watcher sat waiting the return of absent friends, or when the alarmed family were listening to the awful beatings of the tempest, then did it rise with unwonted energy, thrilling on the ear, and paining the sense by its monotonous acuteness. Yet with all its shrillness it was a sound of comfort; it relieved the feeling of loneliness, and breathed, like the tickings of the old clock, the notes of sympathy and companionship.

"Sounds," says Gilbert White, "do not always give us pleasure according to their sweetness or melody; nor do harsh sounds always displease. We are more apt to be captivated or disgusted with the associations which they produce, than with the notes themselves. Thus the shrilling of the field-cricket, though sharp and stridulous, yet marvellously delights some hearers, filling their minds with a train of summer ideas, of everything that is rural, verdurous, and joyous." And thus, we may add, does the song of the hearth-cricket, through the mere effect of association, give abundant pleasure to others, recalling to their minds the fire-side enjoyments and home-born happiness of their youth.

"Around in sympathetic mirth,
Its tricks the kitten tries,
The cricket chirrup on the earth,
The crackling faggot flies."

This insect, so much oftener heard than seen, is of a pale yellow or clay-colour, mixed with brown. In shape it resembles a grasshopper, and is provided with wings, which are generally carried in a horizontal position beneath the wing-cases, and only appear to be used for flight on rare occasions. The legs are long and slender, formed for running or leaping, and the female is provided with an ovipositor, or instrument for depositing her eggs. Although the wings are not much employed in flying, those of the male insect are put to a remarkable use, for they are in fact the means by which it produces its peculiar sound. According to some naturalists, there is on the wing-cases a small circular space covered with a shining membrane, which acts as the parchment of a tambourine or drum. Against this drum the insect works its wings with such rapid and incessant strokes as to produce the sound which we commonly call its song, or chirpings. Others attribute the sound to the grating of the wing-cases against each other, the under parts being furnished with strong nervures or strings, which produce the vibrations in the membrane. The females are not provided with so perfect an apparatus, and therefore remain silent. On this account the crickets have been playfully described as a happy race undisturbed by female volubility. It has been said of the *cicadas*, or tree-crickets,

"Happy the cicadas' lives,
Since they all have voiceless wives."

The abode of the hearth-cricket is frequently in new houses, where the mortar is soft enough to allow of its burrowing in it. But it is not confined to such situations. Any warm and sheltered nook, either near an oven, or in the brickwork of a fire-place, may be chosen by it. Its food is various, but is generally understood to be the crumbs and sweepings of the hearth, including also salt, yeast, broth, milk, and almost any liquid. White has noticed that where these insects are very numerous, they are often found drowned in pans of milk or water, to which their thirsty nature has driven them. Inhabiting a very hot place, and thus being always, as it were, in a torrid zone, they naturally seek

after moisture, and have even been known to gnaw holes in wet woollen stockings and aprons that were hung before the fire. All these depredations are committed in the night, for the hearth-cricket is a nocturnal insect, and does not come forth to feed until after dusk. It is not often that crickets abound so much as to be decidedly mischievous; but there have been cases where they have grown to be a most annoying pest in families, being, like Pharaoh's plague of frogs, "in their bed-chambers, and upon their beds, and in their ovens, and in their kneading troughs." (Exod. viii. 3.) In such extreme cases there are two methods of getting rid of the evil: gunpowder may be placed and exploded in the crevices of the fireplace, or (which is the safer plan) bottles of beer may be set in their haunts, and the crickets will creep into them and be destroyed in the same manner as wasps.

These insects appear to have their likings and dislikings for particular spots, for, while on some hearths they become so numerous as to be disagreeable, on others they can never be persuaded to take up their abode. Rennie introduced crickets repeatedly into two different houses, but could not prevail on them to stay.

The note of this insect is not unsuited to contemplation. Thus Milton introduces it in his *Il Penseroso*:

"Where glowing embers through the room
Teach light to counterfeit a gloom,
Far from all resort of mirth,
Save the cricket on the hearth."

Scaliger also delighted in the song of crickets, and was accustomed to keep some of these insects in a box in his study. The Spanish peasantry have a similar fancy for this shrill music, and, therefore, keep crickets in little cages, which they hang by the fireside.

It has been surmised that crickets are ambitious of raising their voices above all other sounds, and that, when disappointed in this attempt, they will desert their habitation; like many other noisy persons, they like to hear nobody louder than themselves. To strengthen this idea, a story is told of a woman who greatly disliked crickets, and who, having often tried in vain to banish or silence them, at length succeeded by accident. Having one day invited several guests to her house, to celebrate a wedding, she procured musicians, with loud instruments, among which were a drum and trumpet. The noise thus made for the entertainment of her company was so much greater than the crickets had been used to or could imitate, that they instantly took to flight, and were never afterwards heard in the house.

While many insects appear only for a season, flutter awhile in the sunshine, and then die off, or fall into a state of torpor, the cricket, living in a tolerably equal atmosphere of warmth, is as merry at Christmas as at Midsummer, and cheers with its shrill voice the solitary hours of the housewife. It is not to be wondered at, that a few lingering superstitions are still connected with this insect; that its sudden appearance or disappearance, its shrillness of song, or its unwonted silence, should be looked upon as prognostics of good or bad luck to the household. But as the very same circumstance which is esteemed lucky by one person is looked upon as unlucky by another, the hearth-cricket is thus cleared of all mischievous influences, and can lay claim to no other charm than that of enlivening the winter's hearth, giving a voice to the solitary chamber, or chiming in merrily with the happy sounds of Christmas, and the glad festivities of the opening year.

A Latin ode to the cricket, by Vincent Bourne, has been thus admirably translated by the poet Cowper:—

"Little inmate, full of mirth,
Chirping on my kitchen hearth;
Wheresoe'er be thine abode,
Always harbinger of good.
Pay me for thy warm retreat,
With a song more soft and sweet;
In return thou shalt receive
Such a strain as I can give.

"Thus thy praise shall be expressed,
Inoffensive, welcome guest!
While the rat is on the scout,
And the mouse with curious snout,
With what vermin else infest
Every dish, and spoil the best;
Frisking thus before the fire,
Thou hast all thy heart's desire.

"Though in voice and shape they be
Form'd as if akin to thee,
Thou surpassest, happier far,
Happiest grasshoppers that are;
Theirs is but a summer's song,
Thine endures the winter long,
Unimpaired, and shrill, and clear,
Melody throughout the year.

"Neither night nor dawn of day
Puts a period to thy play:
Sing, then—and extend thy span
Far beyond the date of man.
Wretched man, whose years are spent
In repining discontent,
Lives not, aged though he be,
Half a span, compared with thee."

THE YOUNG ESQUIRE;

OR, PRIVATE EDUCATION.

"You ugly black man, in your armour, you shall be beaten! and this is a naughty picture that I don't like, so it shall be well flogged!" said little Charles Shirley, who had dragged a book of prints to the drawing-room floor, and, chiefly to try the powers of his new whip, was testifying his disapprobation of some of them, by inflicting the punishment to which he had sentenced them.

"Dear child," exclaimed a lady from the other end of the room, aroused by the noise from the reverie in which she had been embroidering the rosebud on her delicate slipper, "surely you are not allowed to destroy those beautiful prints?" The boy raised his large dark eyes to the speaker, with the "mild surprise" of offended dignity; he condescended to no other reply: he seemed already to feel, "I am lord of all I survey, and all things are lawful to me." The lady smiled as she looked on the hauteur of the lovely face, and with a momentary elevation of the eyebrows, she thought, "How beautiful he is! how cruel to ruin him by this weak and selfish fondness!" but, being a guest, she felt she had no authority to interfere, so she resumed her work. "We are going to send him to school, shortly," said Colonel Shirley, his father, who had witnessed the scene, and partly read the lady's thoughts; "he ought to have gone last year, but one naturally puts off an evil day." It was natural to Colonel Shirley to do so, for he was a great lover of present ease; he might have adopted Lord Falkland's words as his motto, "Peace, peace, give me peace," and he weighed not the price paid for this present blessing. He knew that the mention of a public school would put his lady out of spirits for the whole day, and that was extremely unpleasant. Mrs. Shirley was a very pretty, but a very weak woman; her parents doated upon her beauty; and her father, being himself an ignorant man, laid down as a principle on which his daughters were to be educated, that learning was quite useless to women. "Nothing is so bad," said he, "as a blue stocking; let the girls learn dancing, drawing, and singing, if you will, that is quite sufficient." These accomplishments being taught, it was thought that enough had

been done; and her father congratulated himself greatly on his wisdom, when he found, that, at the first ball at which the fair girl made her appearance, she had won, by her graceful wanderings through the mazes of the dance, the affections of Colonel Shirley, a man of comfortable possessions and highly respectable family.

Mrs. Shirley's time, after her marriage, was spent principally at Bemerton House; here a succession of guests helped her to while away her youth. As she felt herself under-educated, she preferred, as companions, those who were rather beneath herself in station; with them she felt she had a right to take things easily. She had not been accustomed to mental exertion, and it annoyed her to find any thing of the kind necessary. She entertained a strong partiality for her eldest boy; and the ladies, who were proud of visiting Bemerton periodically, declared him to be the most lovely child they ever saw. "O, the tender blue of those large loving eyes!" exclaimed a sentimental young lady, in a high state of rapture; "how like you is that dear child! surely you will never part with him!" "Not to go to a public school, certainly," answered the mother. She had, in fact, imbibed, from her female acquaintance and others possessing not much experimental knowledge, a strong prejudice against boys' schools, and a settled determination, if possible, to guard her precious Charlie from the dread persecutions and afflictions which she felt convinced he would there encounter. Whenever her husband alluded to the (to her) most painful subject, education, she had some heart-rending anecdote to relate. "Don't you recollect, my dear, what occurred at that horrible place, Eton? Miss Mary Shivers mentioned it the other day: it happened to a relation of hers. She says that dear interesting delicate boy, her cousin, was most shamefully persecuted by some great domineering boy; this savage tyrant had formed a conspiracy for roasting the dear little creature alive, but, fortunately, the tutors discovered the plot, and its execution was thus accidentally prevented. Several times he was dragged through a pond; and it was found that he and another little boy were in the daily habit of crying over their sorrows in a long passage, and that they had determined to kill themselves if they were not removed. And then, you know, how cruel they were to poor little Donkin; he had written a most affectionate letter to his aunt's gamekeeper, begging to be remembered to me, and to his sisters, and to old Sibsop, the housekeeper, because she made him some cakes, and this letter fell into the hands of some of the young savages there, and they ridiculed and tormented the poor child so that he was afraid to show his face: I understand now they annoy him by calling him 'Old Sibsop,' a name which I dare say he will retain through life." Colonel Shirley smiled at these touching tales, but he put off the decisive, and, to his wife, painful step, and allowed her prejudices to be left to live a little longer; for he felt that to eradicate them would be difficult, and to oppose them, unpleasant. Thus Midsummer followed Christmas, and Christmas succeeded Midsummer, and still no plan was formed for the education of the heir. In the meantime, Mrs. Shirley had selected a governess, a veteran in the service, for she had guided the infant studies of the lady herself, and, being learned, had instilled *hic, hæc, hoc*, into the brains of her brother, when as yet "breeches were not." To

Miss Stammerword Mrs. Shirley communicated her fears and anxieties, and that excellent creature testified the warmth of her friendship by offering her services at an excellent salary; and shortly, to prevent mischief, as Mrs. Shirley said, she was established at Bemerton. This arrangement, though it brought repose to the lady of the house, was any thing but satisfactory to young Master Charlie, who had too long roamed unrestrained among footmen, gamekeepers, and gardeners, easily to be tamed to the yoke: these good friends of his, supposing his influence all powerful at head quarters, took care to allow him to indulge every folly, and gratify every whim; and, as soon as he could lisp the words, the infant ruler was dignified with the title of "the young squire." "And pray who are you?" said a friend of Colonel Shirley's, as he happened to encounter the boy for the first time on the lawn. "I am the young squire," said the child, blushing indignantly at what he thought an incredulous smile; "gardener says I am, and so I am! you must not laugh at me." Miss Stammerword soon discovered, that a silken cord was the only one she could with safety to herself use, in her feeble efforts to train the little wild one. A very little discipline produced loud roaring, for the boy knew that "spirits from the vasty deep" were to be so invoked to his assistance. The guardian mother sat in her adjoining boudoir; she would appear at the door, beg to know what crime the child had committed, and why he was so wretchedly unhappy, which he never used to be when she taught him; beg he might not be over-worked, for she had observed him looking very pale for the last two or three days; suggest the propriety of using more amusing books; however, she said, the Latin grammar must be taught, as the colonel wished it, but she hoped Miss Stammerword would not expect too much from so young a child. "Now, darling, do be good, there's a love; you hear what your mamina says, you must learn your Latin: try if you cannot do so by repeating it after me; come, *hoc opus*, a work." "Hocus, pocus, at work," said the boy, as he commenced an attack on the plum-cake Mrs. Shirley had placed in his hands. Colonel Shirley found this mild rule inefficient, and resolved to try some new plan, as the boy was becoming quite a nuisance to the whole household. Wigram the gardener was defied; in vain did he endeavour to secure the blushing treasures which were the pride of his heart from the depredations of Master Charlie and his companions. Walls were easily scaled, the garden robbed of its purple glories, and the lofty height regained by the spoiler, who, dancing along in fearless glee, would challenge "monkey-face" to catch him if he could. This epithet brought the impotent rage of the old man to its pitch, for he was notoriously like a monkey, but he dared not complain. The butler was to stand by and see his wine glasses "squailed at," — dozens were destroyed before he opened his lips; at last his fortitude gave way; "them handsome cut-glass wine glasses" to be thus doomed to perdition! — it was too much for his affectionate heart, he resolved to go to master; yet he paused and considered his words, for he was a wise man; and, after mature deliberation, he thus opened the matter: "Master Charles, sir, how he does grow, sir, to be sure! he is such a lively young gentleman, sir, I never saw the like! he comes into my pantry and breaks all those beautiful cut-glass wine glasses, sir! — He is such a

good-natured lively young gentleman, sir!" "And you are a great fool for allowing him to do it, sir," said the master!—but he felt that he was unjust, and, as the annoyance subsided, he added, "Master Charles is going to have a tutor."

Mr. Henley, the tutor engaged by the colonel, had shown some taste for literature in his youth, but the heavy routine of his dull life, the want of sympathy, and the thoughtless insults of those who thought themselves of the blessed few who are born to consume the fruits of the earth, had apparently preyed upon him, and destroyed the elasticity of his mind; he had dwindled off to a sort of literary quack; he got up passages to bring out and make useful; notorious lines from Homer, Horace, and Virgil, he had ever at his fingers' ends; he thought himself a poetical genius, and rather like Lord Byron, so he made majestic faces, "half savage, half soft:" he thought the drudgery of learning altogether beneath him, and had a presentiment that eventually he should be a great man; but, if this feeling had been analysed, it might perhaps be found rather to consist of a latent notion that it would be a good plan to marry a rich wife, if an opportunity should present itself. His joys were to walk in the long avenues, with Scott or some other poet in his hand; he was fond of a cigar, in a quiet way; he played the flute, and thought himself consumptive; and he took snuff for the benefit of his health. The powers delegated to this person were limited; for instance, he was constantly entreated not to allow Charlie to over-exert his mind; if anything went wrong, Mrs. Shirley never spoke to him at dinner: he saw his way, and took care not to allow his pupil to lead too hard a life. One day, while reading, this altercation took place: such were common: "I will thank you, Charles, not to place your heels on the hobs of my grate, while you are studying with me." "Why, sir! what harm can it do? My mother wishes me to place my heels wherever I like; this is a convenient posture, for I can see my book without the trouble of holding it up." "Go on, sir," said the easy Mr. Henley. Charles proceeded with his Virgil—

*Terrentur visu subito cunctique relictis
Consurgunt mensis—*

"Have you seen the grey poney the coachman brought for me to look at? it goes like the wind, Mr. Henley. I do hope papa will buy it." "Go on with your Virgil, sir," said the tutor, "we will see the poney presently."

About this time Charles lost his father. Colonel Shirley caught cold on his way to attend a magistrates' meeting, his illness turned to pleurisy, and in a few days he was dead. He was not aware of his own danger, and his death being thus sudden he had laid down no plan as to the management of his son; and as Mrs. Shirley continued to be satisfied with Mr. Henley, no alteration took place. Charles, however, thought his tutor rather a bore; in truth, he failed in bringing forward the "amenities of literature:" his own sensibility seemed to be worn away, and he made no attempt to interest his pupil. So that the marker moved on, and authors were read, he was satisfied: their beauties were hidden to him, for he felt them not. Charles soon grew tired of Mr. Henley's "scientific conversations," reserved for the drawing-room; he heard him, indeed, spouting Pope to the ladies, but he saw through the affectation, and, like a thorough protestant, owned

not the supremacy; nor did he enjoy the two or three passages from Milton which were constantly reproduced; he thought that, if the poet was really so great, it was wonderful Mr. Henley never read more of him. Nothing disgusts children more than the dishonesty of affectation. Charles grew sick of Mr. Henley and his quotations, and sought recreation in the only form in which it presented itself, namely, in the sports of the field.

The county afforded these in perfection: there were several good packs of hounds, and, among others, one kept by a Mr. Niger, the Shirleys' nearest neighbour: he was a country squire, who understood sporting in all its branches. Probably he had heard the saying, that an understanding employed on many things profits not; he had given up his attention to one thing, and had mastered it. He was an unerring judge of a horse. Woe to the partridges that fluttered before him! they fell to rise no more. He had received the last sigh of many a vanquished stag, when no others were by; and he had pressed the fleet racer over the smooth turf, and reached the goal amid the shouts of his triumphant friends. He was fond of the society of young people, and had often endeavoured to persuade Charles and Mr. Henley to join his parties. "Mr. Henley, you are always at your book; I suspect you are going to write something very good, and make your fortune. Well, there is no accounting for taste. I never understood that sort of thing. How I worked my tutor! poor fellow, poor fellow, he is dead now! *Ton dupamei bomenos*,—this abominable nonsense, so I construed it. Ha! ha! ha!" With this person Charles soon formed a league of friendship; he thought he was a goodnatured honest fellow, and would do very well to ride about with; and under his tuition Charles's knowledge of and love for horses and dogs daily increased. Mr. Niger's only son was just going to Oxford, and, as the university was consequently often talked of by them, Charles took a fancy to go there himself; more especially as "old Niger," as he called his new friend, would be his companion. He determined to cram to matriculation pitch, which, being naturally clever, he contrived to do, in spite of his disadvantages: he followed the example of his friend, who, having determined not to be one of the reading block-heads, had selected a college whose rules were comparatively not oppressive.

Oxford, however, upon the trial, did not suit Mr. Niger; for it scarcely afforded sufficient sporting to keep him amused. Occasionally, certainly, they got a run with the Duke of Beaufort's hounds, and this was all very well; but, to fill up the time, he indulged his passion for the chase by a run with the bull dogs. He contrived to keep a couple of terriers; at least, he kept one and Shirley the other. These dogs, in seasons of danger, were concealed in drawers, or allowed to slumber on the couches of their lords. Young Niger always maintained the superiority of his terrier, and, in the excitement of a wine party, offered to prove it; for this purpose, a black cat was to be baited in his rooms. The contest took place; but, as this recreation did not happen to coincide with the prejudices of the head of the college, Mr. Shirley and Mr. Niger suddenly found their tether lengthened; they were allowed quietly to depart to the country, in the middle of term.

Charles, when he reflected on what had passed, was ashamed of his own folly, and would have roused

himself to redeem his wasted time, and to cultivate the talents he possessed; but Niger was his only friend,—he ridiculed his regrets, and persuaded him to spend the autumn at his father's, where he expected "some capital fellows," and a very good season. He said, "You have never been to a public school, you know, and you will find it very hard work to get decently through Oxford; you will most likely be plucked for your *great go*, because you have had no time for reading; so come with me, there's a good fellow, throw care away, and take my example, and think no more of that stupid place, Oxford." Charles accordingly accompanied him, with a disturbed and undecided mind.

While staying with the Nigers, he chanced to meet, at some of the country festivities, a family named Selwin. The head of the family was a man of engaging manners, high principles, and cultivated tastes. He had been a barrister of celebrity, but had now retired to the scenes of domestic repose. Two of the sons were in the church, and the daughter, the graceful and accomplished Emily, made their delightful dwelling a charmed spot. Charles was fascinated: the good that was in him seemed ready to spring forth and bud at the sight of so much that he really admired. He soon laid his case before the enchantress, whose magic wand had changed him into a higher being; and she would have listened; but a cold pause ensued—counsels were divided, and the head of the house, after mature deliberation, calmly and decisively rejected him: the acquaintance had been of short standing, and the lady thought it right to abide by the decision of her father.

This was a most severe shock. Charles, however, did not abandon all hopes: when the first tempest of sorrow had passed, he formed resolutions for improvement and usefulness; but, as he was still possessed by these pleasing dreams, young Niger made his appearance. "I thought you were going to marry Miss Selwin," he said. "Nobody else thought so, then," answered Charles, in an unusually sullen tone. "Well, it was talked about, at all events. Watkins said he thought it was a pity you should throw yourself away so, they are such a strait-laced particular set: he said, too, she had no mind; but that is a great mistake, she has a tremendous mind, and writes poetry, and all that sort of thing, don't she? That's what I thought had caught you. However, I am glad to find it is all incorrect, for she has married Sir Richard Evelyn."

Charles concealed his feelings; nor will we attempt to describe that one fearful storm by which all was destroyed. He handed himself over to his unprincipled friend; he was hurried from one amusement to another; careless and unsuspecting, he was shamelessly pillaged; the losses he sustained on the turf induced him to make fresh trials of his luck; he soon became deeply involved, and at last his creditors became clamorous, and his legal adviser recommended him to escape to the continent until arrangements could be made.

"To escape!" he cried, "disgraced, degraded, and heart-broken, I am to escape to concealment! No, let me die rather in prison."

"Ah, my mother! my mother!" rose the feeble voice from the young man's death-bed; "thank God, you have departed before me!"

POPULAR YEAR-BOOK.

April 5.—*Palm Sunday*, (1846.)

PALM SUNDAY is the next before Easter, or the last in Lent; and was so named in commemoration of our Lord's triumphant progress to Jerusalem from Bethany, immediately before His Passion. Its celebration is very ancient, and traced from Palestine, whence it spread through the East, till, in the sixth century, it was established in the West.

OLD AND POPULAR CUSTOMS.

It was anciently customary on Palm Sunday to cast cakes from the steeple of the parish church, the boys scrambling for them below, to the great amusement of the bystanders. Stow records that in the week before Easter, there were great shows in London for going to the woods, and fetching into the king's house a twisted tree or *with*; and the like into the house of every man "of honour or worship."

In a work published at the end of the last century, it is related, that, on the Saturday before Palm Sunday, the boys of the Grammar School of Lanark, according to ancient custom, parade the streets with a palm, or its substitute, a large tree of the willow kind, in blossom, ornamented with daffodils, mezerion, and box-tree. A correspondent in Hone's *Every Day-Book* describes the following singular ceremony at Caistor Church, Lincolnshire, on Palm Sunday. A deputy from Broughton brings a very large ox-whip which is constructed thus:—A large piece of ash, or any other wood, tapered towards the top, forms the stock; it is wrapt with a white leather half way down, and some small pieces of mountain ash are enclosed. The thong is very large, and made of strong white leather. The man comes to the north porch, about the commencement of the first lesson, and cracks his whip in front of the porch door three times: he then wraps the thong round the stock of the whip, puts some rods of mountain ash lengthwise upon it, and binds the whole together with whipcord. He next ties to the top of the whip-stock a purse containing two shillings, (formerly this sum was in twenty-four silver pennies,) then taking the whole upon his shoulder he marches into the church, where he stands in front of the reading-pew till the commencement of the second lesson: he then goes up nearer, waves the purse over the head of the clergyman, kneels down on a cushion, and continues in that position, with the purse suspended over the clergyman's head, till the lesson is ended. After Divine Service is concluded, he carries the whip, &c. to the manor-house of Undon, a hamlet adjoining, where he leaves it. There is a new whip made at Broughton every year, and left, as above related, at Undon. Certain lands in the parish of Broughton are held by the tenure of this annual usage.

In the churchyard of Crowhurst, on the borders of Kent and Surrey, near the east end of the church, is an enormous and very ancient yew tree, measuring ten yards and nine inches in girth, at the height of five feet from the ground. The interior is hollow, and has been fitted up with a table in the centre, and benches around for as many as sixteen persons. From time immemorial this tree has been regarded as the head-quarters of good fortune; and it is the custom of the peasantry to assemble on Palm Sunday beneath the shades of its venerable branches, to hold a wake or fair, and to dance about the tree and the old tombs in its neighbourhood, with palm branches of the willow in their hands. This done, the grand duty of the day has been performed, and the poor people separate with something of the feeling of those who have made a thank-offering. Formerly, excesses were frequently committed on the occasion, through the sale of liquors; but of late years the fair has been conducted with great decorum. At present, the festival is associated with a collection-sermon in the church for the Duchess of Marlborough's Almshouses at St. Alban's.

The above particulars are taken from the *Illustrated London News*, Vol. VI. No. 151, which contains a wood-engraving of the yew tree, &c.

RELIGIOUS OBSERVANCES.

"On Palm Sunday," says an old Homily, "Holy Church maketh procession, in mind of the procession CHRIST made this day; but as we have no olive, we take palm, and welcome Him with song into Church, as they welcomed Him into the city of Jerusalem." Another reason is given why every christian man should take part in this solemnity; namely, "in token that he hath fought the fiend, and gotten the victory." We learn from authentic sources that during the monastic times of England, the palms¹ (or rather sprigs of box and yew,) designed for the use of the Clergy, having been laid on the high altar, and those to be held by the Laity on the south step of the same, were hallowed by the priest or bishop vested in a crimson cope, with prayer and benediction; sprinkled with holy water; perfumed with incense; and then distributed among the faithful, who carried them along the streets, which were strewn with flowers and decked with tapestry. When the procession had moved through the town or city, it returned to church, where mass was celebrated, and the "palms" were offered on the altar. "On Palm Sunday," says the author of *Morus*, "after reading out of The History of CHRIST, every one bore his palm, and nothing else was heard but the sufferings of the MESSIAH." The permission granted to the laity to join in her majestic processions affords an example, among many, of the wisdom of the ancient Church. "The man," observes a late writer, "who taper in hand, or bearing the mystic palm, had paraded along the vaulted aisle, felt himself bound by additional ties to that communion, with which he had not merely worshipped, but in whose most imposing ceremonies he had actually taken a part." The observances of Palm Sunday are thus *improved* (in modern parlance,) by S. Bernard: "We should meet CHRIST," he says, "by keeping innocency, bear olive by doing works of mercy, carry palms by conquering the devil and our vices; green leaves and flowers we carry, if we be adorned with virtues; and we strew our garments in the way, when by mortification we put off the old man."

There is no reason to suppose that these customs were at any time very general. The practice of bearing palms on Palm Sunday was retained in England, after some other ceremonies were forbidden, and was one of those which Henry VIII., in 1536, declared were not to be contemned and cast away. A proclamation, printed and dated 26th February, in the thirtieth year of the reign of that monarch, contains the following clause:—"On Palm Sunday it shall be declared, that bearing of palms reneweth the memory of the receiving of CHRIST into Jerusalem before His death." In Howes's edition of Stow's Chronicle, it is stated, under the year 1548, that "this year the ceremony of bearing of palms, on Palm Sunday, was left off, and not used as before." "Palms," says Hone, "or, to speak properly, slips of the willow, with its velvet-looking buds, are sometimes still stuck in churches on Palm Sunday." Brand observes, that it is yet customary with boys, both in the south and north of England, to go out and gather slips with the willow flowers or buds at this time. And Hone records that it is usual "with men and boys to go a palming in London early on Palm Sunday morning." "This usage," he adds, "remains among the ignorant from poor neighbourhoods; but there is still to be found a basket woman or two at Covent Garden, and in the chief markets, with branches of the willow or sallow, on the Saturday before Palm Sunday, which they sell to those who are willing to buy; but the demand of late years has been very little, and hence the quantity on sale is very small."

(1) Some of the "palms" were consumed for ashes to be laid on the heads of the people with the sacerdotal blessing, on the Ash-Wednesday in the following year.

April 6—is the Monday in *Passion Week*, (1846.)

This week is thus designated on account of its being dedicated to the contemplation of the REDEEMER's sufferings and death.

During this sacred period, the chant became more solemn, no altar was decorated, no bell sounded, and no pompous equipage rolled in the streets. Princes and vassals, rich and poor, went on foot in habits of deep mourning. Legal proceedings were suspended, sovereigns ordained that prisons should be opened, pardon granted to criminals, and insolvent debtors discharged. S. Chrysostom says, that the Emperor Theodosius sent letters of remission to the cities for the days preceding Easter, a custom which was observed by his successors, who, as S. Leo the Great remarks, made the altitude of their power stoop in honour of the passion and resurrection of CHRIST, and tempered the severity of the laws during the days on which the world was redeemed, in order to imitate the divine mercy. In France, also, in the seventh century, this custom was observed. Subsequently, the same indulgence was granted on the days preceding Christmas and Whitsuntide.

April 9.—*Maunday Thursday*, (1846.)

Maunday, or Maundy Thursday, termed also *SHEER THURSDAY*, is the day before Good Friday. Its second appellation seems to have arisen from the practice which the monks and clergy made of cutting and trimming their hair and beards on this day, "and so make them honest-against Easter." Some writers suppose Maunday Thursday to be a corruption of *mandate Thursday*: *dies mandati* being its ancient name, in allusion to the *mandate* of our SAVIOUR to His disciples to offer the Holy Eucharist; and to his other *mandate*, after He had washed their feet, to love one another, both which commands were given on this day. Others suggest that it seems most probably to have been derived from *maund*, a Saxon word for a basket, in consequence of the distribution of gifts on this day in baskets—the word *maundy*, used by old authors for alms or gifts, being, apparently, derived in its turn from the above charitable practice. "In an old jest-book," says a journalist, before cited, "there is a story of a rich merchant dictating a testament to a scrivener, while a poor nephew stood by, hoping to hear of something to his advantage. While the testator was still enumerating the debts due to him, the nephew cried, 'Ha, ha! what saith my uncle now?—does he now make his *maundies*?' 'No,' answered the cool man of business, 'he is yet in his demands.'" This is an example of the secondary meaning; of the first, we have instances in Bishop Hall speaking of "a *maund* charged with household merchandise," and Shakespeare saying, "A thousand favours from her *maund* she drew." A *maund* seems to have been a basket much like our modern hamper.

After receiving the Sacrament of Maunday Thursday, archbishops and priests, kings and princes, in imitation of their REDEEMER, proceeded to wash the feet of the poor, and to wait upon them at table. At Durham Abbey, anterior to the Reformation, the prior, laying aside his jewelled rings, poured water from the rich silver ewer on the feet of eighteen aged mendicants, gave each thirty pence, and seven red herrings, and "did serve them with drink, three loaves of bread, and certain wafer cakes." Cardinal Wolsey, at Peterborough Abbey, in 1530, "made his maund in our Lady's chapel, having fifty-nine poor men, whose feet he washed and kissed; and, after he had wiped them, he gave every of the said poor men twelve pence in money, three ells of good canvass to make them shirts, a pair of new shoes, a cast of red herrings, and three white herrings; and one of these had two shillings." About the same period, the Earl of Northumberland, on Maundy Thursday, gave to each of as many poor men as he was years old, and one over, a gown with a hood, a linen shirt, a platter with meat, an ashen cup filled with wine, and a

leathern purse containing as many pennies as he was years old, and one over; besides miscellaneous gifts to be distributed in like manner, in name of his lady and his sons. Edward the Third, in 1363, appears to have been the first English monarch who introduced into this country the practice of feeding, clothing, and giving money to indigent persons on this day; and many successive sovereigns used also, in order to show their humility, to wash the feet of those selected as the proper objects of their munificence. Queen Elizabeth, when in her thirty-ninth year, performed this pious observance at her palace at Greenwich, on which occasion she was attended by thirty-nine ladies and gentlewomen. Thirty-nine poor persons being assembled, their feet were first washed by the yeoman of the laundry, in a silver basin, filled with warm water and sweet flowers, next by the sub-almoner, then by the almoner, and, finally, by the Queen herself ("after some singing, and prayers made, and the gospel of Christ's washing of His disciples feet, read"), kneeling. These various persons, the yeoman of the laundry, the sub-almoner, almoner, and her Majesty, after washing each foot, wiped it, marked it with the sign of the cross above the toes, and then kissed it. Clothes, victuals, and money, were then bestowed. This interesting ceremonial is described at length in the *Hierurgia Anglicana*, pp. 282, 283. James II. is said to have been the last of our monarchs who observed the above rite in person. William of Orange left the washing to his almoner; and such was the arrangement for many years afterwards. On Maunday Thursday, 1731, George II. being then in his forty-eighth year, "there was distributed, at the Banqueting House, Whitehall, to forty-eight poor men, and forty-eight poor women, boiled beef and shoulders of mutton, and small bowls of ale, which is called dinner; after that, large wooden platters of fish and loaves; viz. undressed, one large old ling, and one large dried cod, twelve red herrings, and four half-quarter loaves. Each person had one platter of this provision; after which were distributed to them, shoes, stockings, linen and woollen cloth, and leathern bags, with one-penny, two-penny, three-penny, and four-penny pieces of silver, and shillings, to each about four pounds in value. His Grace the Lord Archbishop of York, Lord High Almoner, performed the annual ceremony of washing the feet of the poor, in the Royal Chapel, Whitehall, as was formerly done by the kings themselves." (*Gentleman's Magazine*, 1731.) For many years the washing of the feet has been entirely discontinued, and since the beginning of the present reign, an additional sum of money has been given, instead of provisions. In the ancient account-books of the various noble families of England, we always find a liberal sum entered as "given at ye maundy."

Each year at Rome, on Maundy Thursday, the altar of the Capilla Paolina is illuminated with more than 4000 wax tapers; and the Sovereign Pontiff and Cardinals go thither in procession, bringing the Host along with them, and leaving it there. Then the pope blesses the people, and commemorates our Blessed Lord's humility towards his disciples.

At Moscow, the Archbishop takes off his robes, girds up his loins with a towel, and proceeds to wash the feet of twelve monks, designed to represent the Apostles, until he comes to the representative of S. Peter, who rises, and the same dialogue takes place between him and the prelate, as between that Apostle and our Saviour. The ceremony is performed in the cathedral, which is crowded with spectators. One of the public sights at Seville on this day, is the splendid cold dinner which the Archbishop gives to twelve poor persons. The dinner is to be seen, laid out on tables filling two large rooms of the archiepiscopal palace. The twelve guests are completely clothed at the expense of their host; and having partaken of a more homely dinner in the kitchen, they are furnished with large baskets to take away the splendid commons (allotted to each

in separate dishes), which they sell to the gourmands of the town. At two in the afternoon, the Archbishop, attended by his chapter, repairs to the cathedral, where he performs the ceremony, which, from the opinion of its being literally enjoined by Christ, is called the *mandatum*. The twelve paupers are seated on a platform erected before the high altar, and the prelate, stripped of his silk robes, and kneeling successively before each, washes their feet in a large silver basin.

"From the *Gloria in excelsis* of the mass of Maundy Thursday, till that of the mass of Easter-eve, our bells," says Dr. Challoner, "are silent throughout the Catholic Church, because we are now mourning for the passion of Christ. Our altars are also uncovered, and stripped of all their ornaments, because Christ, our true altar, hung naked upon the cross." In answer to the inquiry, "What is the meaning of visiting the sepulchres upon Maundy Thursday?" the same person observes, "The place where the blessed Sacrament is preserved in the church, in order for the office of Good Friday (on which there is no consecration), is by the people called the *sepulchre*, as representing, by anticipation, the burial of Christ. And where there are many churches, the faithful make their stations to visit our Lord in these sepulchres, and meditate on the different stages of His passion." This devotion was encouraged by the indulgences which the Church attached to its observance. "It is still," says a modern Romanist, "a practice observed in France, to pass the night within the tomb, in adoration of the sacramental Presence there. During the day, the streets of cities wonder at the unaccustomed spectacle of holy recluses and devout women, in the habits of their respective orders, who, throughout the whole year, are never seen beyond the cloisters, excepting on this occasion." At Genoa, twenty-one confraternities of devout laics proceed in procession, after vespers, to the sepulchre of the metropolitan church, carrying lighted tapers, crosses, and various mystic emblems, curiously wrought.

THE MAN OVERBOARD.

(From Letters from Italy, by J. T. Headley.)

THE pleasure of our passage was much marred by the loss of a man overboard. When within a few hundred miles of the Azores, we were overtaken by a succession of severe squalls. Forming almost instantaneously on the horizon, they moved down like phantoms on the ship. For a few moments after one struck us, we would be buried in foam and spray, and then heavily rolling on a heavy sea. We, however, prepared ourselves, and soon got everything snug. The light sails were all in; the jibs, topgallants, and spanker, furled close; the main-sail clewed up, and we were crashing along under close-reefed topsails alone, when a man, who was coming down from the last reef, slipped, as he stepped on the bulwarks, and went over backwards into the waves. In a moment, that most terrific of all cries at sea, "A man overboard! a man overboard!" flew like lightning over the ship. I sprung upon the quarter deck just as the poor fellow, with his "fearful human face," riding the top of a billow, fled past. In an instant, all was commotion; plank after plank was cast over for him to seize and sustain himself on, till the ship could be put about, and the boat lowered. The first mate, a bold, fiery fellow, leaped into the boat that hung at the side of the quarter deck, and, in a voice so sharp and stern—I seem to hear it yet—shouted, "In men—in men!" But the poor sailors hung back—the sea was too wild. The second mate sprung to the side of the first, and the men, ashamed to leave both their officers alone, followed. "Cut away the lashings," exclaimed the officer; the knife glanced around the ropes, the boat fell to the water, rose on a huge wave far over the deck, and drifted rapidly astern. I thought it could not live a moment

in such a sea, but the officer who held the helm was a skilful seaman. Twice in his life he had been wrecked, and, for a moment, I forgot the danger in the admiration of his cool self-possession. He stood erect; the helm in his hand; his flashing eye embracing the whole peril in a single glance; and his hand bringing the head of the gallant little boat on each high sea that otherwise would have swamped her. I watched them till nearly two miles astern, when they lay-to to look for the lost sailor. Just then I turned my eye to the southern horizon, and saw a squall, blacker and heavier than any we had before encountered, rushing down upon us. The captain also saw it, and was terribly excited. He afterwards told me that, in all his sea life, he never was more so. He called for a flag, and springing into the shrouds, waved it for their return. The gallant fellows obeyed the signal, and pulled for the ship. But it was slow work, for the head of the boat had to be laid on to almost every wave. It was now growing dark, and if the squall should strike the boat before it reached the vessel, there was no hope for it. It would either go down at once, or drift away into the surrounding darkness, to struggle out the night as it could. I shall never forget that scene. All along the southern horizon, between the black water and the blacker heavens, was a white streak of tossing foam. Nearer and clearer every moment it boiled and roared on its track. Between it and us appeared, at intervals, that little boat, like a black speck on the crest of the billows, and then sunk away, apparently engulfed for ever. One moment, the squall would seem to gain on it beyond the power of escape, and then delay its progress. As I stood and watched them both, and yet could not tell which would reach us first, the excitement amounted to perfect agony. Seconds seemed lengthened into hours. I could not look steadily on that gallant little crew, now settling the question of life and death to themselves, and, perhaps, to us, who would be left almost unmanned, in the middle of the Atlantic, and encompassed by a storm. The sea was making fast, and yet that frail thing rode it like a duck. Every time she sunk away, she carried my heart down with her, and when she remained a longer time than usual, I would think it was all over, and cover my eyes in horror; the next moment she would appear between us and the black rolling cloud, literally covered with foam and spray. The captain knew, as he said afterwards, that a few minutes more would decide the fate of his officers and crew. He called for his trumpet, and, springing up the rattlings, shouted out over the roar of the blast and waves, "*Pull away, my brave ballies, the squall is coming—give way, my hearties!*" and the bold fellows did "*give way*," with a will. I could see their ashen oars quiver as they rose from the water, while the life-like boat sprung to their strokes down the billows, like a panther on the leap. On she came, and on came the blast. It was the wildest struggle I ever gazed on, but the gallant little boat conquered. Oh! how my heart leaped, when she at length shot round the stern, and rising on a wave far above our lee quarter, shook the water from her drenched head, as if in delight to find her shelter again. The chains were fastened, and I never pulled with such right good will on a rope, as on the one that brought that boat up the vessel's side. As the heads of the crew appeared over the bulwarks, I could have hugged the brave fellows in transport. As they stepped on deck, not a question was asked—no report given—but, "*Forward, men!*" broke from the captain's lips. The vessel was trimmed to meet the blast, and we were again bounding on our way. If that squall had pursued the course of all the former ones, we must have lost our crew; but when nearest the boat, (and, it seemed to me, the foam was breaking not a hundred rods off,) the wind suddenly veered, and held the cloud in check, so that it swung round close to our bows. The poor sailor was gone; he came not back again. It was his birth-day, (he was 25 years old,) and, alas! it was his death-day! . . . We saw him no more; and a

gloom fell on the whole ship. There were but few of us in all, and we felt his loss. It was a wild and dark night; death had been among us, and had left us with sad and serious hearts.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE MUFFIN-MAN.¹

A LITTLE man, who muffins sold
When I was little too,
Carried a face of giant mould,
But tall he never grew.

His arms were legs for length and size,
His coat-tail touch'd his heels;
His brows were forests o'er his eyes,
His voice like waggon-wheels.

When fallen leaves together flock,
And gusts begin to squall,
And suns go down at six o'clock,
You heard his muffin-call.

Borne in the equinoctial blast,
He came and shook his bell;
And with the equinox he pass'd,
But whither none could tell.

Some thought the monster turn'd to dew
When muffins ceased to reign,
And lay in buds the summer through,
Till muffin-time again;

Or satyr, used the woods to rove,
Or even old Caliban,
Drawn by the lure of oven-stove
To be a muffin-man.

The dwarf was not a churlish elf,
Who thought folks stared to scoff;
But used deformity itself
To set his muffins off.

He stood at doors and talk'd with cooks,
While strangers took his span;
And grinsly smiled at childhood's looks
On him, the muffin-man.

When others fled from nipping frost;
And hid from drenching skies,
And when in fogs the street was lost,
You saw his figure rise.

One night his tinkle did not sound,
He failed each 'custom'd door;
'Twas first of an eternal round
Of nights he walk'd no more.

When borne in arms, my infant eye
Its restless search began;
The nursery-maid was wont to cry,
"See, John the muffin-man."

My path with things familiar spread,
Death's foot had seldom cross'd;
And when they said that John was dead,
I stood in wonder lost.

New muffin-men, from lamp to lamp,
With careless glance I scan;
For none can ever raze thy stamp,
Oh, John, thou muffin-man!

(1) From "Poems and Pictures." See before, page 317. The illustration is also borrowed from the same work.

The Muffin Man.

Thou standest snatch'd from time and storm,
A statue of the soul;
And round thy carved and goblin form
Past days—past days unroll!
We will not part,—affection din
This song shall help to fan,
And Memory, firmer bound to him,
Shall keep her muffin-man.

A. J.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

"In literature I am fond of confining myself to the best company, which consists chiefly of my old acquaintance, with whom I am desirous of becoming more intimate; and I suspect that nine times out of ten it is more profitable, if not more agreeable, to read an old book over again, than to read a new one for the first time. If I hear of a new poem, for instance, I ask myself whether it is superior to Homer, or Shakspeare, or Virgil; and, in the next place, whether I have all these authors completely at my fingers' ends. And when both these questions have been answered in the negative, I infer that it is better (and to me it is certainly pleasanter) to give such time as I have to bestow on the reading of poetry to Homer, Shakspeare and Co.; and so of other things. Is it not better to try and adorn one's mind by the constant study and contemplation of the great models, than merely to know of one's own knowledge that such a book is not worth reading? Some new books it is necessary to read—part for the information they contain,

and others in order to acquaint oneself with the state of literature in the age in which one lives; but I would rather read too few than too many."—*LORD DUDLEY'S Letters*.

DESDEMONA is perfect throughout; I was trying her the other evening by the severest ordeal—St. Paul's exquisite delineation of charity, or, as it should be translated, love. Shakspeare must have had it in his thoughts: it fits her in every point, especially in her unsuspecting purity, "thinking no evil." Observe her wonder in what manner her husband could think her false; and, oh! what a contrast between her mind and Emilia's, at the end of the fourth act: and again, between her and Juliet, the poetical, passionate Juliet. I remember no one simile or metaphor that Desdemona utters, and Juliet's fancy is rich as the orange groves of Mola di Gacta, and sparkling as the waves that ripple to their feet: but she is "of the earth, earthy," in comparison with the pure azure heaven of Desdemona's mind, which one can gaze up into as into infinite space, unarrested by a cloud, unless of tears and sorrow.—*Lord Lindsay's Letters*.

POETICAL GENIUS.

*Poeta nascitur, non fit.*¹ Is this true? And what then is a poet? Is he a being set apart from his infancy—endowed with feelings, propensities, capabilities, to which his fellow-creatures are strangers? Is he one who has been sent into the world with a mind so fashioned as to be unfitted for the common duties of humanity?—as to be constituted, that, as we are told, they must be so miserable who link their worldly fate with his—a mind whose moral aberrations we are called upon to pardon, because a larger portion of the spirit of God is vouchsafed to him than to others? For, what is Genius but the spirit of God? He has told us that he is Love. We know by his works that he is power and beauty;

and are not these the components of poetry? Poetry is but the beauty of ideas, as distinct from the beauty of things. If, then, poetic talent be a manifestation of the spirit of God, can we for a moment allow the thought that he has, by the gift of it, constitutionally unfitted some of his creatures for obedience to his laws, and thereby nullified to them the promise of eternal life? The absurdity of this is too evident to need remark. We are told that, "of those to whom much is given, much will be required." What is the *much* which is given to poets? It is the higher perception of moral and material beauty—the more intense feeling of moral and material fitness—the more enthusiastic hope of moral and material perfection. It is the power of awakening their less gifted fellow-creatures to a perception, equal with their own, of moral and material

(1) Nature, not art, makes a poet.

excellence; and it is, or ought to be, the means of leading their aspirations to the throne of Him who is the soul of excellence. And are these the endowments which are to absolve the poet himself from moral obligation? It cannot be—we know that it cannot. But the question is not, "Do they absolve?" but, "Do they not confer a greater responsibility?" and this brings another consideration, that, wherever the Almighty has imposed responsibility, he has likewise bestowed proportionate capacity of action. The power of seeing moral beauty and fitness more clearly is, or ought to be, the power of acting more in accordance with the precepts of beauty and fitness, than can be expected from those on whom a less unclouded light is bestowed. A poet, therefore, should be a super-eminent religious and moral character. Alas! well is it written—

"Weak is the will of man, his judgment blind,
Remembrance persecutes, and hope betrays."

It may be thought that we have hitherto been begging the question, our observations tending to show that, indeed, "*Poeta nascitur*;" but we must not be so misunderstood: nor would we advocate precisely the reverse of our text. What we wish to prove is, first, that poetic talent, or feeling, is by no means a rare,—nay, that it is a common gift; and, secondly, that it is dependent for its improvement and perfection upon the cultivation of moral and religious feeling.

In speaking of poetic talent we do not in any way include rhyme; this is, and has always been, a matter dependent upon outward circumstances of locality, temperament, fashion. We would scarcely include phrase and diction, our estimate of these being variable, and often influenced by most unworthy associations. But we would define poetry to be that mode of expression, by which intensity of feeling on any subject is conveyed from one mind to another. Of course, the more just—the more striking is the mode of expression, the more complete and rapid will be the communication; hence—and still more, because many persons have not courage to dive beneath a rough surface—it is desirable that the poet should be able to clothe his thoughts in mellifluous language. But words are not poetry. Witness the beautiful idea of the greatest benefactor to history in our day, Professor Heeren: "*Persepolis, rising above the deluge of years*." This, being a translated passage, is not dependent upon phraseology for its beauty. But who does not feel its exquisiteness, picturing at once the almost miraculous stability of those thread-like columns which the intemperate policy of Alexander failed to overthrow, and the vague, shapeless uncertainty which clouds the period to which their erection is attributed? The whole passage forms one of the most poetically drawn pictures we have ever met with. We had intended referring to a single sentence in the "*Story without an End*;" but, upon looking into the book we find it impossible: the whole is a poem: and this again, however ably it may be translated, arises from the "*thoughts that breathe*," not from the "*words that burn*." Poetic beauty, then, may exist without musical phraseology:—that it may exist despite of common-place language, Wordsworth's "*Excursion*" is an instance. Place this poem beside the highly-polished, elaborately-finished "*Essay on Man*" of Pope; is not the latter far less poetical in essence than the former? Both are reasoning poems; that of Pope is, perhaps, the finest piece of morality in verse ever written; but in vain do we seek in it the ethereal, the heavenly light, which in Wordsworth opens to our view the powers and proper aims of humankind. Pope has evidently weighed every phrase, every word; Wordsworth is often obscure, sometimes vulgar. Again:

"Time sadly overcometh all things, and is now dominant, and sitteth upon a sphynx, and looketh unto Memphis and old Thebes; while his sister, Oblivion, reclineth semi-somnous on a pyramid, gloriously triumphing, making puzzles of Titanian erections, and

turning old glories into dreams. History sinketh beneath her cloud. The traveller, as he paceth amazedly through those deserts, asketh of her, Who builded them? and she mumbleth something, but what it is he knoweth not."

Is not this poetry? and yet how quaint, almost in-harmonious, is its structure. Compare it with the famous simile in Pope's *Homer*, beginning,

"Thus, when the moon, refulgent lamp of night."

Will this passage, replete with the most gorgeous epithets, and clothed in the most harmonious verse, bear a comparison with the strangely-apparelled poetry of Sir Thomas Browne? It is not our ear which prompts the verdict, it is our innate feeling of truth and beauty. If thus poetic genius can exist, independent and despite of phraseology, may we not suppose it to be given (we do not say in a high degree) to multitudes of those whom the world would never accuse of being poets? Our daily experience confirms this. We have heard a servant describe scenery, with a beauty of feeling and an imagery which was true poetry; and we hear a child talk poetry to her doll. Facility of illustration is an attribute of poetic genius we have met with in a labourer; and one of the most prosaic of our friends possesses this to such a degree as to render her conversation a perfect picture—she dramatises, illustrates; yet the hint that she might be a poet would be met by a declaration of utter impossibility. Let but our readers note carefully the conversations of every-day life, and they will be convinced with us, that the verse in Gray's *Elegy*,

"Perhaps in this neglected spot is laid,"

is not hyperbole, no visionary dream of that true poet, who has but too often marred the effect of his genius by forced alliteration and far-fetched epithets.

In advocating the position that poetic genius is very generally inherent in our nature, we willingly and triumphantly admit the almost unapproachable pre-eminence of those masters of song whom the world delights to honour. As, in the deteriorated race of mankind, there arises occasionally a Milo, a Maximin, or a Belzoni, to remind us that "there were giants in those days;" so does, from time to time, a torrent of high poetic talent burst forth from some favoured being, not to prove that the rest of his fellow-creatures are ineane and unendowed, but to show in its greatest glory the spirit which God hath given to man.

It has been said, that no man can be a true poet who does not live in a land of mountains; but this can never again be asserted,—our own poets of the present age falsify it: and we might show with ease that it was not true in earlier times. We might refer to the muse of Friesland and Batavia; but it is a more worthy answer, that the heart of man is the same in every clime, in every age, by the "*lazy Scheldt*," as by the "*wandering Po*." Scenery, habits, necessities, will materially influence, nay, even direct genius; but they cannot create it. One apparent exception presents itself to us. The Muses never visited the valley of the Nile. When we remember the ancestry of the Egyptians, their early connexion with the inhabitants of Palestine and Syria, and their later subjugation by Persia, that true land of poetry and romance, we are at a loss to account for the anomaly of a great and polished people devoid of anything approaching to poetry; for their sculpture, their paintings, their inscriptions, bear no trace of poetical feeling. Yet Egypt had been, during a long period, under the dominion of Cushite conquerors. Moses, the earliest of poets, received his inspiration amid her stupendous halls. What, then, choked the seed of the most lovely plant of human intellect? Let the answer be a lesson to us. It was the *materialism* of her religion, and of her national pursuits. Poetry might co-exist with, nay, it might form a part of, the Sabæan or Magian worship. Poetry was the germ of Hindu idolatry; but with the low, the unspiritual, the material

religion of the Egyptian *people*, poetry could not amalgamate. Expert almost as ourselves in adapting their productions to the calls of the senses, skilful and unwearied in the invention of everything that would minister to luxury, the domestic arrangements of the Egyptians were almost perfect; while the magnificence and splendour of their buildings just fell below the sublime, from the absence of intellectuality: their architecture, stupendous as it was; their pyramids, untouched by the lapse of ages;—all was prosaic. How different from Elora and Mavalipuram! We had rather accompany Crishna in his fatigues and wanderings, or follow the almost equally fabulous standard of Kawan, when it retrieved the glory of Iran, than slumber in dignified repose upon the couches of the Pharaohs.

The second part of our subject may be more shortly disposed of. We fully agree that "*Poeta non fit*;" but we affirm that a genius, even of a moderate grade, may be cultivated and refined into excellence. The memory of our readers will readily point to instances in which even first-rate poetic talent has sunk into degradation by the extinguishment of moral feeling; and, could we read the hearts and minds of the bright lights of the world of poetry, we might see how the contemplation of that which is good and beautiful has fanned, as well as purified, the flame of genius. It is impossible that its fire should burn steadily or strongly when surrounded by the base atmosphere of passion or selfishness. And does not the appetite for the beautiful grow by what it feeds on? The more frequently and deeply we contemplate the face of nature, the more intense is our admiration; it is by raising his thoughts above the concerns of time and sense, and by endeavouring to fix them upon the works of the Almighty, that a poet is educated, if not made. All real poets, from the earliest ages, have loved nature; and we can scarcely imagine a mind incapable of being raised to something like poetry by the contemplation of a beautiful landscape. It would not be difficult to trace in a poet's works the lapse of his moral being into careless sensuality, nor to mark the gradual renovation of his muse under better influences:—the poet has varied with the man. How necessary, then, is it for the aspirant after poetic excellence to cultivate the virtues, as well as the talents, of his nature!

THE MILLER'S NIECE.

A STORY OF CIRCUMSTANTIAL EVIDENCE. (1)

CHAPTER II.

On the day of trial the Court was crowded, and many well-dressed ladies were observed in the audience. Judge Heath was a man whose character inclined to severity.

A death-like stillness pervaded the court, when the prisoners were called forth and conducted to the bar. All eyes were instantly turned upon them, and a half-suppressed exclamation of surprise broke forth. Richard Bracewell appeared deadly pale; but stood firmly, and looked respectfully yet unwaveringly upon the members of the jury. Margaret looked modestly downwards, and her cheeks were flushed; but when, now and then, she lifted her eyes to confront a witness, it was with a calm and steady expression. Will Crooks presented, in his whole person and demeanour, a striking contrast to his fellow-prisoners. He attempted, sometimes, to assume an air of defiance; but his boldness was evidently superficial; his eyes could find no place of rest; he stared, winked, looked at the floor, then at the ceiling, then at the Counsel for the Prosecution, and changed his attitude every minute, but never blushed.

The first indictment was read, charging all the three prisoners at the bar with having been concerned in causing the death of John Smith, miller, &c., by drowning or other means.

To this all the prisoners pleaded "not guilty;" and

Crooks spoke in a tone of voice as firm and steady as that of his companions at the bar.

Sergeant Jackson was employed for the prosecution, and, amid profound stillness, opened the statement of the case.—

"I feel this to be a case," said he, "gentlemen of the jury, in which our respective duties, though very solemn and important, are also very clear—we have to attend to facts: I have to *state* them, as clearly as I can, and you have to *consider* them, and judge whether or not they leave room for any reasonable doubt of the guilt of the prisoners at the bar. Your most minute attention is required to every particular in the statement; and I doubt not that you will give it, as you feel your responsibility to the public, and to your own consciences. Without further preface, then, I proceed with the statement of the case. The deceased, John Smith, into whose sudden disappearance and death we have to inquire, was a respectable man, esteemed by his neighbours, and having as few enemies as a man can hope to have, who is at all engaged in worldly business. His habits were remarkably regular, and among them was noticeable his attention to the old maxim of "early to bed and early to rise." It may be confidently stated that he did not return to his house at an unseasonably late hour half-a-dozen times in his life. It is important to notice a man's character and habits of life, when we are required to consider the circumstances of his disappearance. There are some men who can stay out all night without exciting any remarkable alarm or surprise, (a laugh,) but there are many witnesses to prove to you that the deceased, John Smith, of Fordingplace Mill, was never a man of that character. I shall now proceed to notice all the circumstances of his disappearance, before I make any remark upon the conduct of the prisoners at the bar. On the 7th day of November last, he left his house in company with his niece and housekeeper, Margaret Smith, to walk to the cottage of his tenant, Robert Wilkinson. This cottage is about half-a-mile distant from Fordingplace Mill. There are no intermediate houses; nor is there a path except between the two places just mentioned. The path runs along by the side of the mill-stream as far as the copse where the stream joins the river, and then turns up to Wilkinson's cottage. At the house of Wilkinson the deceased transacted his business in a cheerful and good-humoured way, and having taken a little refreshment, departed to walk back to the mill with his niece. But he never reached his home! On the evening of the third day after this event, his body was found lying in the mill-stream, beside the copse just mentioned, livid and swollen, and with some marks of contusions on the face, apparently having been several days in the water. I must say a word with respect to the spot where the body was found. You must observe that the copse I have mentioned is situated between the path and the mill-stream, so that a person must go through the copse to get to the stream at that spot where the body was found. This spot is about a hundred yards' distance from the mill, and almost that distance from the plank across the mill-stream, over which the parties must pass. The stream at this place (by the copse, I mean,) is overshadowed with boughs, and, as no person has any business there, it is not remarkable that the body should lie undiscovered from Tuesday until Friday evening. The person who discovered it on the evening of the 10th of November last, is a man well known in the neighbourhood, and addicted to botany and other more peculiar studies, which accounts for his being in the fields so late. And now I must turn to relate the conduct of other persons relative to this matter; and, first, I must beg you to notice the conduct of the prisoner at the bar, most intimately connected with the deceased. We do not see facts fairly without a view of their antecedents: and I feel it, therefore, my duty to state fully the relation in which the prisoner at the bar stood to the deceased before the night in question. The prisoner

(1) Concluded from p. 372.

Margaret Smith, had resided at the mill, as her uncle's housekeeper, for upwards of five years. It was generally allowed that she had been a diligent and good housekeeper, and there was but one point—but a very serious one—upon which the deceased had expressed himself as dissatisfied with her conduct; this was the encouragement which she gave to the addresses of a person disapproved by the deceased—

Here Counsellor Atkinson, who was engaged for the defence of Margaret, interposed to complain that the learned Sergeant was interfering with matters irrelevant to the case. Richard looked indignantly, and Margaret just raised her eyes to cast a reproachful glance on the counsel for the prosecution as he continued—

"I must contend that I am only stating what is necessary for a fair understanding of a case dependent on circumstantial evidence; but to proceed—On the night of the disappearance of the deceased, the prisoner Margaret Smith arrived at the mill, and was met by the servant-maid, to whom she addressed, in a very cool manner, the inquiry, 'Has not my uncle arrived yet?' Shortly afterwards, a noise was heard at the door, when the prisoner remarked, with equal coolness, 'That is Richard Bracewell;' and it does not appear that during that night she made any attempt to find, or cause to be found, her missing uncle. It must also be observed, that very shortly after the arrival of the prisoner Margaret Smith, the prisoner Richard Bracewell also arrived at the Mill. Very shortly afterwards he also was missing from the country, and did not appear again until the 14th of the same month. About the same time, William Crooks, the third prisoner at the bar, was missing from his accustomed haunts, and he returned to the house of Ellen Crooks, at Fordingplace, one day after the return of Bracewell. You will hear witnesses who will sufficiently prove to you, that, on the evening of the deceased's disappearance, the prisoners Bracewell and Crooks were drinking together in a way-side tavern, the Black Dog, situated about half-a-mile from the spot where the body of John Smith was found, and that they left the house together about half-past eight o'clock on the same evening. Observe, at half-past nine, or a few minutes later, Bracewell and Margaret Smith met at the Mill, and by the time when the servant returned to the house, Bracewell had disappeared. Such are the leading facts of the case, and I do not wish to add many remarks to them. You have to consider how you can best account for them by the rules of rational probability. Did the deceased commit suicide? The suspicion, I firmly believe, has never been entertained by any individual. He was not the man to commit suicide. Healthy, prosperous, and on good terms with the world and with himself, he naturally loved life. Besides, he would not have taken his niece with him for such a purpose. But the supposition is too unreasonable to demand a word further. Did he meet with his death by accident? Did he, in walking home with his niece, stray through the copse, and fall into the mill-stream, and yet all so quietly and suddenly that his attendant never observed it? I say it with grief; but I cannot see a possibility of such an occurrence. Was he murdered by persons unknown and unapprehended? or was the conduct of the prisoners at the bar, immediately subsequent to his disappearance, of such a nature as to admit of no explanation except by the supposition of their guilt? These are the questions, gentlemen of the jury, which I suggest for your most serious consideration; and your attention to the particulars stated by the several witnesses will, I believe, enable you to come to a just determination." Thus the learned Sergeant concluded his statement.

The first witness called was Susan Holmes, formerly a servant at the Mill. The substance of her statement was as follows:

"I lived, for a year and a month, servant under Margaret Smith at the mill. I was generally on good terms with my mistress. I believe she has a hot temper,

and does not like to be contradicted." (Here Counsellor Atkinson interposed to complain of the questions.) "I believe there was unpleasantness sometimes between master and mistress about Richard Bracewell. It had been getting worse, I think, a little before master disappeared. I was in the house all the time while master and mistress went to Robert Wilkinson's. Mistress came in about half-past nine. It was later than I expected. She looked rather warm as I should say. I don't think her face is easily coloured by a little walking or any sort of work. She asked me if master had come in—did not seem much surprised when I told her 'no.' She opened the door for Richard Bracewell. She had not been in the house five minutes when he came in. He looked flushed—not very much in liquor, I should say. He could walk steadily. I had seen a man cross the plank over the mill-stream just before mistress came in. You can see the plank from the kitchen window. I am sure it was not master. It was a misty night, but I could see his figure, and by his walking quickly I judged it was a young man. I cannot say it was Richard Bracewell."

Cross-examined by Counsellor Atkinson.—"I went out soon after Richard Bracewell came in. I called at Nell Crooks': I had been there before. Edward Crooks never paid me particular attentions. Young Nell was at home, and I talked with her awhile. When I returned I did not see Bracewell. I have been to Nell Crooks' several times since then."

During the examination of this witness, Margaret kept her eyes stedfastly fixed on her face; and it was observed that the girl looked very much confused when confessing her visits to Nell Crooks' house.

The next witness called was Thomas Batters, the landlord of the Black Dog.

Examined by Mr. Bailey.—"The prisoners, Richard Bracewell and William Crooks, were at my house on the evening of the 7th of November last. They drank two quarts of ale between them. Crooks had been at the house nearly all day. Bracewell came in about half-past seven o'clock. They left the house about half-past eight. They were not drunk. Crooks had been at my house the evening before with William Naylor, the young man who is missing. I cannot say how much ale they drank that night, the 6th of November. They went away very late. It was past midnight. Naylor was very drunk. He could not have walked without Crooks' assistance. I have never seen Naylor since he left my house with Crooks that evening. He was generally drunk. He spent a great deal of money; more than his own independent property would cover, I believe. Bracewell has never been at my house since the 7th of November."

Jane Hartley, Mr. Bracewell's housekeeper, was next examined.

"I have lived at Mr. Bracewell's, the attorney's, now for more than three years. Richard, the prisoner at the bar, I have always considered a steady young man. He took his dinner at home on the 7th of November. After dinner I did not see him again until late at night. He came in flushed and seeming tired; did not take any supper, but drank a tankard of ale. He went out, soon after breakfast, on the morning of the 8th, and I did not see him again until the 14th day of November."

Robert Wilkinson, a small farmer, was then placed in the box.

"I rented a few acres of land under the deceased, John Smith. He was at my house on the evening of the 7th of November last. I paid him a small account for meal and bran. He was in very good spirits, and took some ale. I cannot say justly how much; but it might be something more than three half-pints. It was not small beer. My wife generally brews good ale. I don't often take more than a pint of it at a time. The deceased, John Smith, often called at my house. I never knew him to be out late at night. He was no ways given to drink. His niece, Margaret, did not say

much while she was in my house with him. They seemed good friends when they left. I saw nothing of John after that, until I saw his body in the mill-stream just by the copse."

When the examination of the witness had closed, Jonas Singleton was called for, and there was a murmur through the Court,—"The prophet! the wise man of Fordingplace!" as he appeared. Counsellor Atkinson immediately rose to object to the examination of this witness, on the ground of his mental incompetency; but this objection was overruled by Serjeant Jackson's assertion that there was no proof of such incompetency, and, accordingly, Singleton was examined. He gave a rational account of his discovery of the corpse, and was then cross-examined by Counsellor Atkinson, who handed to him a paper containing the "vision" which we have narrated.

"Now, Sir, is that your handwriting?"

"I believe it is."

"You there state, that on the night of the 12th of November last you saw the prisoners, Richard Bracewell and Margaret Smith near the copse so often mentioned in the Miller's field. Now, I ask you, did you see them *bodily* as you saw the corpse of the Miller in the stream on the evening of the 10th of November last?"

"I saw them, as it were, *in a vision*," said Singleton.

"And may I ask you, have you not often seen in your 'visions' people whose bodies were, at the same time, a hundred miles distant?"

"Yes; they come to me in visions." (A laugh.)

"Very well; and have you not seen people walking and heard them talking who had been buried for some years?"

"I, perhaps, have; but I forget many things."

"You have seen King George, I believe, in the Miller's field aforesaid?"

Serjeant Jackson objected to this leading question.

"I must persist," said Counsellor Atkinson, "in showing the Court the general incapacity of the witness to give sound evidence in any case; and for this purpose I claim permission to read over some papers which I hold in my hand, and which are all in the handwriting of the witness, Jonas Singleton, as he will allow." The counsellor here handed the papers to Singleton, who looked over them, and confessed that they were all in his handwriting.

"My lord," said the counsel for the defence, turning to the judge, "you must have patience with me for reading these strange papers, as I shall, afterwards, show that they bear very seriously upon the case." He then read the following papers:—

"September 3d.—Moon's second quarter—likely to have much rain. I was in the Brigg Close near the river—much colt's-foot grows about here—face due north—very cloudy sky. I saw a man like little Wiggins the quack doctor coming over the field; and, now and then, he stooped down and gathered up something—herbs very likely. When he came to me he said, 'There is a herb of rare virtues in this field that you know nothing of.' I asked him if he would tell me what it was. He said he would if I would promise him only *one* thing. I asked him what that was. 'It is,' said he, 'that you will never pay any more attentions to Margaret.' I said, 'No!—vanished!' (Great laughter in the court.)

At the mention of her name, Margaret blushed; but seemed to have some difficulty in suppressing a smile. Young Bracewell smiled openly as the paper was read. The counsellor then took up another paper and read:—

"September 7.—I was in the 'high-field,' about seven o'clock—heard the town-clock strike, and old Jemmy the sexton came to me and said, 'Some very great person is dead.' I asked him who? but he could not tell me the name. Then I saw Will Crooks and two boys getting through a hedge; and Susan Holmes came up and said some hens had been stolen from the Mill, and her mistress was very mad about them.—Vanished! then I saw, down in the Miller's field, Richard Bracewell walking very fast to the Mill.—Vanished!"

"Of such materials," said the counsellor, "are the rest of these papers composed; and I leave it to the jury to consider what attention should be paid to the statements of the witness who wrote them."

Robert Walker, surgeon, was next examined,—and stated as follows:—

"I saw the body of the deceased, John Smith, on the eleventh of November, but did not open it. I cannot say there were marks from blows upon the head or face. The skin was discoloured; but it might be the effect of immersion in water. The body had evidently been in the water a considerable time. I should say as long as two or three days."

Thus ended the statements for the prosecution; and when Counsellor Atkinson, a rising young man, stood up to begin the defence, there was great excitement, especially among the ladies in the court. Margaret now raised her head and looked at the young counsellor with some expression of hopefulness in her countenance, as he began to speak.

"It is hard to conceive," said he, "of two persons placed in a situation more interesting and awful than that of the two individuals at the bar. But I must also remind you, gentlemen of the jury, that if there ever was a case when you needed to feel the weightiest responsibility, and to exercise the utmost caution in estimating the true import of the facts laid before you, it is now. Two persons in the bloom of life stand before you, and in such circumstances, that it rests with your verdict either to restore them to life, and the prospect of happiness, or to consign them to an early and dishonourable grave. Dreadful would be the mistake caused by presumption, were a court of justice, summoned to protect society from convicted offenders against human rights and interests, to warrant the execution of two unoffending persons, and thus deprive, *for ever*, human society of two worthy members! To guard against such a fearful and irreparable injury, our law has wisely determined that, where there is doubt left by the evidence of a case, the prisoner shall have the benefit of the doubt. Gentlemen of the jury, before I proceed to examine the real value of the statement made by the learned Serjeant for the prosecution, I must most earnestly protest against a remark which fell, I would hope, unadvisedly, from his lips. 'You have to consider,' said the learned Serjeant, 'how you can best account for these facts by the rules of rational probability.' I deny the principle altogether. It has no right to be harboured for a moment in a court of justice. No, no! gentlemen, you have not to *account* for the facts stated. You are not, as it has been insinuated, driven to the dilemma of either convicting the prisoners at the bar, or else giving some more rational account of the disappearance of the deceased. You have only to determine whether the evidence laid before you contains clear and indubitable proof of the guilt of the prisoners."

"Gentlemen, the Counsel for the prosecution travelled back, I think unnecessarily, to state particulars respecting the parties at the bar which are irrelevant to the case; and he has thus compelled me to travel a little further still, and to estimate the real value of the particulars thus stated, in the light of the characters of the parties concerned. I can conceive no worse state of society than one in which the testimony of general character is distrusted or easily thrown aside, on account of a few unfavourable appearances. Why, the best man among us, judged in this fashion, would not be safe. I say the best man living may be in the midst of circumstances that might tell against him, if his general character were never taken into account. A hundred little things unnoticed every day would swell into importance, when a criminal charge was preferred. What is the value of the particulars stated? These young persons wished to marry, and the deceased, it appears, was opposed to the match. Well; what of that! Such circumstances are found in hundreds of households in this country, and yet murder is not likely to be the result. There may,

possibly, be found among the fair auditors in this assembly, some who differ from their uncles or guardians respecting matrimony; but they never dream of solving the difficulty by murder; and why should you entertain the thought that over the prisoners at the bar cherished such a design? I say you have no proof of it; and the suspicion ought to be at once removed from your minds, and the evidence brought forward should be looked at alone, and not in an unfavourable light reflected from such a suspicion. Banish it, then, gentlemen, from your minds. Remember that, just in proportion as the evidence for the prosecution is vague and uncertain, the weight of the general character of the accused person ought to tell against such evidence. Let us, then, look at the general character of the accused Margaret Smith. Even the witnesses against her cannot deny that it was irreproachable. So well and satisfactorily did she perform the duties of housekeeping, so valuable had she made herself to her deceased uncle, that his principal ground of opposition to her projected marriage was his unwillingness to part with such a good and faithful mistress of his household. If there is a sure mark of goodness of internal character among women, it is surely in the self-sacrificing, constant devotion to the welfare of a household. A woman who shows such a spirit is not likely suddenly—no! not at the call of opposed love, to conceive a plan for murdering a relative and a benefactor. Now, what were the facts of the case so far as the accused, Margaret Smith, was concerned? She left Robert Wilkinson's house, in company with her uncle, about half-past eight o'clock on the evening of the 7th of November last, and arrived at the Mill alone, at about half-past nine. This is really the whole statement against her. Now what has been said of the circumstances of the journey? The night was so misty that you could not see a person clearly at ten yards' distance. Still the deceased knew the way to his Mill; but what evidence have we of the state of sobriety in which he set out from Wilkinson's house? He had taken 'a little refreshment,' says the learned Serjeant. 'It might be something more than three half-pints,' says Wilkinson. A pint and a-half of *what*? The witness says, 'My wife brews *good ale*. I do not often take more than a pint of it at a time.'

"Now, with respect to the place where the body was found: is it a wonderful thing that a man intoxicated should miss his way, and walk through a copse? And what evidence have we to show that his body might not float down from another part of the stream? There are witnesses, who will tell you that the mill-stream is swift and strong enough for that. Now, as to the conduct of the accused, on arriving at the Mill. She asked the servant, 'Has not my uncle arrived yet?' This, of itself, would be a proof of innocence. What is said to make it look like a sign of guilt? She asked the question, it is said, 'in a very cool manner.' Who can say what notions the witness, Susan, may have of a cool manner? And when was coolness or calmness, in a young offender at least, discovered to be a sign of guilt? What occasion was there for any sudden alarm? The deceased might have turned aside into the yard, or gone into the Mill, to attend to some little business. But what have we next brought forward as a sign of guilt? The accused recognised the footsteps of Bracewell. Could she not discern the step of a young from that of an old man? Was Bracewell a stranger? Was his coming in the evening a new thing? Is it, I ask, a wonderful thing, for a young woman to spring up and open the door, when she hears the footstep of her lover? Well, how long did they remain together? There is no evidence that they remained together five minutes. I say, there is no fact to discountenance the assertion, that Margaret Smith instantly told Bracewell of her uncle's disappearance, and that Bracewell instantly set out to search for the missing man. She had sent out, in search of her uncle, the truest and most devoted person whom she knew; and what could she do more?

It would not have been seemly for a woman to trust herself out in the dark night. But what evidence have we that she ever closed her eyes that night? Bracewell did not return, and, as he conducts his own defence, I leave him to account for his absence; but it does not affect the case of my client. You have heard a full statement of all the facts in which she is concerned, and I have shown that they amount to nothing clearly against her.

"She missed her uncle when walking several yards behind him, on a misty night. The path by the stream, near the Mill, is bordered with soft moss, and would give no sound of footsteps; so that she could not know how far he was in advance of her. She sent out, in a few minutes after her arrival at the Mill, a person in search of her uncle. That person did not return; and from this mystery relative to other individuals, a charge is conjured up against the last person in the world likely to be guilty of the crime suspected.

"Gentlemen of the Jury, I have shown you that the circumstances on which the charge is founded are not weighty enough to shake the testimony of good character in favour of the accused person. I shall now, with a good confidence, leave my client's case to your sober and patient judgment. You will dismiss all popular rumours and prejudices from your minds, and allow the voice of common sense and conscience to quell the suspicions which have been excited by circumstances, perhaps mysterious, and certainly unfortunate, but not sufficient to sustain a charge so awful as that brought against the prisoner. You will not allow the dark cloud of suspicion which has gathered around the good reputation of, I believe, a virtuous and worthy young woman, to blacken into the night of a death of infamy; but disperse it at once, and restore her to life, good fame, and happiness."

Here Counsellor Atkinson closed his address, and the witnesses for the defence were called.

Sarah Stokes, an old nurse, was the first witness called, and stated as follows:—

"I am a nurse, and attended the late John Smith during an illness, about two years ago, and I can testify that the conduct of Margaret Smith, the prisoner, was always exceedingly kind towards her uncle."

Mary Barnes, who had lived as servant-maid at the Mill, confirmed the statement of the first witness. Next, a woman, who had called at the Mill for milk on the morning after the Miller was lost, stated that the grief and trouble of Margaret were evident.

John Green also, servant-man to Robert Wilkinson, stated that the path along by the mill-stream was mossy, so that a footstep upon it would be inaudible at a little distance.

Edward Norris, a man who worked in the Mill, stated that the mill-stream would, at certain times, be strong enough to carry down a man's body as far as from the plank to the copse.

These were all the witnesses who came forward for the defence.

Richard Bracewell was then allowed to make his own defence. Margaret raised her head, and looked with an earnest, and yet confident, expression at the speaker, as he began,—

"My Lord, Gentlemen of the Jury,—I thank you, and the just laws of my country, for this opportunity of speaking in my own defence. If I intended anything like pleading, I might have found a more capable advocate; but, as I wish only to state facts, you may see the propriety of my speaking on my own behalf. The case at present before you demands ample time for mature deliberation, I will, therefore, consume no more of it with introductory remarks, but at once address myself to the statement of facts. Gentlemen, if you hear me without favour, I trust you will hear me without any determined prejudice. The points which I have to explain are the following:—my interview with the prisoner Crooks, on the 6th of November last; my ap-

pearance at the Mill on the same evening; and my absence from home from the 8th to the 14th of November. I am sorry that I cannot give my explanation of the circumstances without giving information very unfavourable to other persons;" [here Crooks was evidently perturbed] "but I owe a duty to my own life, to one whom I esteem far beyond the value of that life," [here there was a murmur of approbation among the ladies] "and, more than all, to the God of truth and justice. I will, therefore, tell you all I know."

"You have heard an individual of the name of William Naylor mentioned in the evidence given by the witness Thomas Batters, landlord of the Black Dog. Gentlemen, I must make some statements respecting that young man's character, to explain the interest which I felt, and the exertions I made, on his behalf. He had been my schoolfellow. He had good qualities, though they all seemed drowned in one vice—that of habitual, I might almost say constant, intemperance. His father left a sum of money for him, under the control of my father, to be paid quarterly. Unhappily, the young man was brought up to no business or profession. He fell into the lowest company, and often, I have good reason to believe, lost sums of money, by unfair means, in such company. He had been missing from home since the 4th of November last; but, as his habits were so very reckless and irregular, this excited little surprise. His mother-in-law, however, was alarmed when she discovered, on the sixth of the same month, that he had taken a considerable sum of money from her till, and requested me to make my best efforts to find him, and recover some portion of the money. I knew, as all the neighbours knew, that he was very often in company with the brothers William and Edward Crooks. Of their characters I do not wish to say a word: I would only refer you to all the people of their neighbourhood. I went to the Black Dog on the evening of the 7th, and found William Crooks there. I gave him liquor, to conceal from him the object of my visit. When I inquired after Naylor, he seemed unwilling to give me any information. We left the Black Dog together, and I followed him to the house of Nell Crooks, in Fordingplace, where he lodges. Here I was violently abused by the woman of the house, and a young woman generally known by the name of Young Nell, with whom Naylor was intimate. I left this house, and called at several public-houses, inquiring for Naylor; at one of these houses I saw John Green, the servant-man of Robert Wilkinson, farmer, who informed me that he had seen William Crooks and William Naylor together, on the evening of the 6th instant." [Here Crooks, the prisoner, was observed to turn very pale.] "He told me that Naylor appeared to be very drunk, and that he watched the two men until they approached a hovel in the Bridge-field, near to which was a manure-heap. He would have followed them, but knew the character of the men. I determined to prosecute my search in the morning. After leaving John Green, I walked to the Mill. I can give no particular reason for going there, beyond the motive which led me there as often as opportunity allowed. With regard to the lateness of the hour—half-past nine—I may observe, that the deceased, John Smith, generally retired to bed at nine o'clock, and I had frequently visited the house after that time. I had not been in the house five minutes before Margaret Smith told me, with some anxiety, that her uncle was missing, and I did not stay ten minutes longer in the house, after I heard that. Yet I cannot say that I felt any great anxiety on his account. Margaret Smith also told me that she thought her uncle was somewhat affected by the ale he had drunk, and that he had threatened to "clout" me, if he found me in his house."

As I left the Mill, I said I would make some inquiry after him; but still I thought he must be about the place, and, as I did not wish to meet him, I neither looked for him nor called after him. I called at the

house of an acquaintance, where I stayed a few minutes, and then went home to my father's house, where I drank a tankard of ale, and immediately went to bed. The next morning I communicated my business to my father, put some money in my pocket, and went out, soon after breakfast, to renew my inquiries after the missing William Naylor. I went, first to John Green before mentioned, whom I found at work in the Bridge-field. We went to the manure-heap, mentioned before, and, turning over the straw, found marks as if the body of a man had recently lain there. I confess I had very dark suspicions of the treatment which the missing man had received from his companion, the prisoner, William Crooks. [Here Crooks scowled upon Bracewell.] I then went up into the town, and had some conversation, at the Fleeco tavern, with Mrs. Naylor, the mother-in-law of the missing individual. She told me that he had talked of leaving her, and going to visit some relatives near Burnley. I communicated to her my worst fears, and she earnestly begged me to make all possible inquiries after him. I rode on the coach to Burnley, where I, also, have friends, who pressed me to stay with them a few days. I did so; and employed much of my time in searching for Naylor, but to no purpose. His friends denied all knowledge of his having been in the neighbourhood. I wrote from Burnley to my father on the business.

"Gentlemen, I have concluded my statement. A word or two more, and I leave myself in your hands. You see that it has been necessary for me, in clearing myself, to open a new case of suspicion against another. This complication of your duty must require ample time for investigation. Truth and justice, I believe, gentlemen, will ultimately triumph even in this imperfect world; but they cannot always triumph in a day. Time, then, gentlemen—time—time is all I require from you to save my own reputation, and the happiness of those dear to me."

Here Bracewell concluded. During the whole of his statement, Crooks had looked upon him with a dismal scowl.

The witnesses called to corroborate Bracewell's statement were, a relative from Burnley, Mrs. Naylor, and the landlords of the public-houses mentioned in his story. John Green, the servant-man of Robert Wilkinson, also confirmed all the statements with which his name had been connected; and his brother, James Green, asserted that he had observed, on the morning of the 8th of November, the mark of a slipping foot at the edge of the mill-stream, a little above the copse on the way to the Mill.

No witnesses appeared in favour of the prisoner Crooks.

The court was then adjourned, and met again in half-an-hour. The Judge then proceeded with his summary of the evidence; but before he had uttered many words, Sergeant Jackson entered the court, and stated that he had fresh evidence now to lay before the Jury, in the shape of a confession just made and signed by the prisoner, William Crooks. Bracewell and Margaret seemed amazed at this announcement, and there was great astonishment throughout the court while the Sergeant read the following document:—

"I, William Crooks, do solemnly declare that, on the evening of the 7th of November last, I met the prisoner, Richard Bracewell, by appointment, at the Black Dog. He brought a short bludgeon in his pocket, and, after we had drunk several pints of ale, we set out to waylay the deceased, John Smith, near the copse. As the deceased was coming down the field, Bracewell whispered to me, 'The old villain has his niece with him.' But the niece stayed behind as her uncle approached the copse. It was a little after nine o'clock. We let him go past the copse a little way, and then Bracewell said to me, 'Now's your time, Crooks!' I then went after the Miller; but Bracewell kept concealed in the copse. I struck the deceased twice on the head with the

bludgeon, then drew the body to the mill-stream, and pushed it in. I then went into the copse. In a few minutes Bracewell and I came out of the copse, and drew the body down to the shady place where it was found. Bracewell promised me good pay; and, soon afterwards, we separated. This, I solemnly declare, is the whole truth of the way in which the miller met his death.

"Signed, WILLIAM CROOKS, + his mark.

"In the presence of, "WILLIAM BAILEY, Barrister."

"SAMUEL KNUBBS, Gaoler."

The Judge then asked the prisoner, Crooks, if he had anything to add to this statement? He refused to say another word. Bracewell was then asked if he would make any reply to the statement just read over.

"My Lord," said he, "I am utterly amazed at the awful wickedness of the man who has brought forward this false confession. It is throughout a lie; but I still beg for time—time, my Lord, that the truth may become apparent."

The Judge then addressed the Jury, and they retired. After a long absence they returned with the verdict—"We find the prisoners, Richard Bracewell and William Crooks, GUILTY of WILFUL MURDER—the prisoner, Margaret Smith, NOT GUILTY."

The prisoners were next asked if they had anything to say why sentence should not be pronounced. Crooks refused to speak. "For time, my Lord, is all my prayer," was the answer given by Bracewell.

The Judge then put on his black cap, and pronounced sentence of death upon the condemned prisoners, warning them to prepare for a speedy execution. They were then conducted to their cells.

Crooks was sitting in his cell on the eve of execution. Young Nell had visited him during the day to inquire for Naylor: but he had repulsed her with violence. Mr. Bracewell, the elder, with Margaret Smith, and the chaplain of the prison, now entered his cell. The chaplain earnestly entreated the prisoner, if he had anything more to confess, that he would not delay. Margaret fell upon her knees, and added the most touching prayers to the exhortations of the chaplain. The conscience of the prisoner seemed to be writhing in torture, until, late in the night, he bade them get pen and paper, and take down his last words in this world. The gaoler and other witnesses were called in, and the prisoner made a second and last confession, as follows:—

"Every word in my former confession is false, except that Richard Bracewell met me at the Black Dog on the 7th of November last. He came to inquire after Naylor. I was drinking with Naylor all day, on the 6th. He had plenty of money, and told me he meant to leave the country. He got very drunk towards evening, and said he would go to Nell Crooks, and bid good bye to young Nell. I took him into the cow-house in the Bridge-field, and there struck him one heavy blow on the head with a short bludgeon. He groaned and fell, as I thought, dead on the spot. I buried his body in the manure-heap. I have never seen him, nor heard of him, from that day to this. I solemnly declare that Richard Bracewell never plotted with me against any man's life; but that all he ever had to do with me was to ask me about William Naylor. I state this for truth, as I hope God will have mercy on my miserable soul."

In consequence of this confession, Richard Bracewell was reprieved. The next morning, William Crooks was hanged in the presence of an unfeeling crowd, among whom were many of the people of Fordingplace and the neighbourhood; and young Nell conspicuously exhibiting her assumed grief on the occasion. The moment before the fatal bolt was drawn, the miserable man turned in reply to a question put to him by the chaplain, and confirmed solemnly, with his last breath, the statement he had made on the previous night. He then fell struggling, and died amid the brutal shouts of the crowd.

Still Richard Bracewell was kept in confinement; but wonders had not yet ceased. A few days only after the execution of Crooks, a man arrived at Fordingplace who declared himself to be the missing, *the murdered man*—William Naylor! The identity was proved by numerous witnesses, young Nell being in the number. He was examined before the magistrates, and made the following statement:

"My name is William Naylor. You must all recognise me. My mother-in-law is Mrs. Naylor of the Fleece. I need say nothing of my habits and character when I lived here; but I will tell you all I remember of the circumstances connected with my disappearance from this part of the country. I had been drinking for weeks. Richard Bracewell had refused to pay me money in advance. I had taken a considerable sum from the till of the Fleece. I had some notion of paying it back when I could. I was drinking with Will Crooks on the last night I was seen here. He took me to a cow-house in the Bridge-field. I forget how we quarrelled. I think we said something about hell. I remember a heavy blow on my head that made fire flash all around me, and then I remember nothing more until I found myself lying in a manure-heap in the morning. I lurked about in the copse of the Miller's field all the day, and considered that this was a good opportunity for leaving the country. I determined to set out at night-fall. I was in the copse at night, I should say about nine o'clock. I was hardly in my right senses from the drink and the blow; but I remember well, I was frightened by hearing a gurgling noise in the stream, and I fancied I saw some great black body floating in the water: but I did not stay to examine it. I left the copse and went over the plank by the Mill. I saw nobody. I then crossed the ford, and walked nearly to Burnley that night, but did not call on my friends there. I have plenty of witnesses to prove where I have been ever since that time."

The result of the examination proved the truth of this statement, and Richard Bracewell was liberated a few days afterwards. He returned, in triumph, to his father's house. He and his faithful Margaret lived together in happiness, long enough to see all traces of suspicion, and even rumours of the old story, die away from the neighbourhood.

We may observe that the greatest changes made in the substantial facts upon which the above account is founded, are in the names of the persons, and the localities mentioned.

FRENCH COLONIZERS.

ROBERT Cavalier de La Salle,¹ the first colonizer of Louisiana, (he started on his discoveries A. D. 1678,) is a striking person as a colonizer and discoverer; if for no other reason, at least for the peculiar nationality of his character; and the features in him, that, throughout his course, are perpetually reminding us of the Frenchman. We do not mean the latter to be understood in an unfavourable sense. The French character has a light gallant affectionate side of it; and shows, in some of its specimens, a mixture of innocence and spirit which is very taking. La Salle has this remarkably. He has not the grave, plodding, energetic, persevering, diplomatic character of the English colonizer. The founders of our colonial empire were men made in a different mould, to what we see in this light-hearted, gallant, French adventurer. And the fruits of their labours have been proportionally more enduring and solid. The Frenchman has colonized for the benefit of the Anglo-Saxon in the west, and no sooner has he settled himself in his new domain, than the heavy weight of English vicinity has ousted him out of it. The Saxon shows that genius for occupation, management, and system, which alone gains

(1) Library of American Biography, conducted by Jared Sparks. Boston.

permanent hold upon a new country. In the first instance, however, and in the act of exploring and finding his way from lake to lake, and forest to forest, in the new region, the Frenchman is quite as vigorous in his way as the Englishman. He mixes up the excitements of discovery, however, with pleasures and tastes quite his own. He strews flowers by the way, makes pretty scenes as he goes along, mounts his gay colours on the top of the rock, and festoons the forest stumps. He notes his progress by ornamental erections, and begins to dance when he has arrived at the end of a good day's or week's exploring, and thinks he has achieved something. He is stimulated, moreover, by the thorough French love of *la gloire*, and does not dream of adulterating the noble admixture with any base mercantile feeling. He has not shipping, and docks, and factories in view: his discovery is a fine dream to him. He is pleased with it, as he would be with a good play; and the real hardships and roughnesses he endures are mixed with something of his old opera house, stage light, side scene, and other Parisian sympathies. We hear of dancing on board, as the ship of discovery was crossing the Atlantic. "A joyous company of girls on board sought to wear away the tediousness of the voyage, and enliven the spirits of the passengers by the amusement of dancing. This was more than the grave and scrupulous Recollect, (a priest of a particular order,) could endure, and he took occasion to reprimand the young damsels, and check their hilarity. La Salle interposed, and said there was no harm in dancing."

His men are frightened at their first start upon their Mississippi voyage of discovery, with a picture of the horrors and dangers of that mysterious river.

"Nikanape, a man of rank in the camp, and brother to the great chief of the nation, who was absent on a hunting excursion, invited the Frenchmen to an entertainment; and before sitting down to the repast, he made a long speech, the drift of which was, to advise his guests against the perilous scheme of going down the Mississippi. He said that others had perished in the attempt; that the banks were inhabited by a strong and terrible race of men, who killed every body that came among them; that the waters swarmed with crocodiles, serpents, and frightful monsters; and that, even if the boat was large and strong enough to escape these dangers, it would be dashed in pieces by the falls and rapids, or meet with inevitable destruction in a hideous whirlpool at the river's mouth, where the river itself was swallowed up and lost. This harangue, which the orator enforced by expressions of anxious concern for the welfare of his friends, produced an obvious effect on the minds of La Salle's men."

La Salle instantly brings the image of *la gloire* before them.

"He said the dangers, which had been painted in such glowing colours, bore on their face so clear a stamp of exaggeration and improbability, that he was convinced that Nikanape himself would excuse him for regarding them with utter incredulity; and, even if they were as formidable as had been represented, the courage of Frenchmen would only be the more eager to encounter them, as crowning their enterprise with the greater glory."

La Salle himself starts on his voyage from France, with a patent of nobility; he is the *Sieur de la Salle*. The *Sieur de la Salle* builds his ship "Griffin," in Canada, for Mississippi discoveries. The vessel was named "the Griffin," in compliment to the Count de Frontenac, whose armorial bearings were adorned by two griffins, as supporters.

"The ship was completely finished, rigged, and equipped within six months from the day on which the keel was laid. The ornamental parts were not forgotten. A griffin, with expanded wings, surmounted by an eagle, sat on the prow."

The ceremony of taking possession of a district is characteristic in the same way. The *Sieur de la Salle*, it should be known by the way, always wears, on such occasions, and on all occasions of ceremony, "a scarlet coat, embroidered with gold."

"The arms of France were attached to the column, with this inscription: *Louis the Great, King of France and Navarre,*

reigns; the 9th of April, 1682. All the men were under arms, and, after chanting the *Te Deum*, they honored the occasion by a discharge of their muskets, and cries of *Long live the King*. The column was then erected by the *Sieur de la Salle*, who made a formal speech, taking possession of the whole country of Louisiana for the French King, the nations and people contained therein, the seas and harbours adjacent, and all the streams flowing into the Mississippi, which he calls the great river St. Louis. A leaden plate was buried at the foot of a tree, with a Latin inscription, containing the arms of France and the date, and purporting that La Salle, Tonty, Zenobe, and twenty Frenchmen, were the first to navigate the river from the Illinois to its mouth. The cross was then erected with similar ceremonies. At the same time an account of these proceedings was drawn up, in the form of a *Procès Verbal*, certified by a notary, and signed by thirteen of the principal persons of the expedition."

This sort of harmless, amusing pomp goes on throughout, and La Salle's chivalry, and old "chateaux" associations follow him into the new world. He carries France with him wherever he goes.

There is the same character shown in the poetical defection of mind which comes out when he has ill luck, and expresses itself by giving a melancholy name to a station he erects, or a river he crosses; and his geographical chart, in the act of formation, expresses, by the nomenclature upon it, the different phases of mind the discoverer was in. He is deserted, on one occasion, by "six of his men, including the two sawyers, whose services were exceedingly important. The defection of so large a number was not only discouraging in itself, but a sad breach in the company." He built a fort soon after this loss, and called it, "in sympathy with his feelings, Fort Crèvecoeur, *Broken Heart*." Again,—

"Five or six miles beyond, they came to another river, which Father Anastase says was broader and deeper than the Seine at Paris, bordered on one side by the most beautiful trees, and on the other by extensive plains. They crossed it on a raft. This was the Colorado. It was afterwards called the Maligne by La Salle, in consequence of one of his party having been devoured in it by a crocodile."

His engaging manner to his people in all distresses, and way of making speeches to them, and cheering them up, are quite in the style of French amiableness and goodnature. "The *Sieur de la Salle*, calling the people together, addressed them in an eloquent speech, says Anastase, 'with that engaging air which was so natural to him,' presenting such motives to sustain their constancy as the occasion would admit, and encouraging them to hope for his speedy return with succours to relieve their distresses."

With this gaiety, gallantry, and spirit, religion comes in too, and has its place in the scene. La Salle takes out friar missionaries with him, whom he takes into his counsels, and treats as his bosom friends. They accompany the course of discovery, preaching and converting, when they have the opportunity; assisting La Salle in boat and fort-building when they have nothing better to do.

"Although La Salle had received his education at the hands of the Jesuits, and had lived with them for many years, yet his predilections seem to have leaned towards the Recollects. From them he chose the spiritual guides, who were to accompany him in his discoveries. When he arrived at Fort Frontenac, he found Fathers Gabriel, Louis Hennepin, and Zenobe Membre, awaiting his orders; and also Luke Buisset and Melithon Watteau, the former destined for the missionary station at the fort, and the latter for that at Niagara. They were all natives of the Spanish Netherlands. The most renowned of these Fathers was Hennepin, who has figured in the literary world, and who will often appear in the course of this Narrative. He came to Canada in the same vessel with the *Sieur de la Salle*, when returning after his first voyage to France; and from that time he had been employed as a missionary at Fort Frontenac, or in rambling among the Iroquois. In some of these excursions he visited Albany, then called New Orange, and other frontier settlements of New York. Being of a restless temper, it was not his humor to remain long in the same place."

The mixture in La Salle's mind of arms and religion attracts the remark of the American Biographer. In a

speech to a crowd of Indians on stepping out of his canoe,

"La Salle took the first opportunity to explain to them the objects that had brought him to their country, which he could do with the more facility as he was accompanied by two interpreters. He told them that he had come from Canada to impart to them a knowledge of the true God, to assist them against their enemies, and to supply them with arms and with the conveniences of life. At this interview he said nothing about his proposed voyage to the Mississippi. In fact, his aim seems only to have been to quell their apprehensions and rivet their friendship. The idea of teaching them the Christian religion, and at the same time putting firearms in their hands to excite their passion for war, is so incongruous, that this report might be doubted, if it were not confirmed by two of the missionaries who were present, and who relate the circumstance without comment."

However, the preaching of the missionaries produces an impression, in spite, too, of the great difficulty of their not understanding the Indian language, nor the Indians theirs. They find the cross respected, though they cannot discover why.

"No demonstrations of hostility were shown by the natives, who cordially accepted the calumet of peace, visited the Frenchmen in their camp, and invited them to their village. The shore was lined by a concourse of people to receive them, cabins were assigned for their accommodation, fuel was supplied for their fires, abundance of provisions was brought to them, and for three days they were regaled with a continual feast. These Indians, it was remarked, were of a much gayer humour than those of the north, more frank and open-hearted, more gentle in their manners, and decorous in their deportment. The *Sieur de la Salle* was treated with marked deference and respect. He took possession of the country in the name of his king, erected a cross, and adorned it with the arms of France. This was done with much pomp and ceremony, at which the savages testified great joy, and doubtless supposed it to be intended for their amusement. Father Zenohe also performed his part, by endeavouring to impress upon the multitude some of the mysteries of his faith, as far as he could do it without understanding a word of their language; and he did not despair of having produced good effects, especially as he observed, on his return, that the cross stood untouched, and had been surrounded by the Indians with a line of palisades."

Such is the character of La Salle's course of adventure. He is a gallant adventurer in the first place; he is a converter and missionary in the next; and he and his "Recollects" act together with perfect harmony and brotherly spirit. He goes through his difficulties with a light heart. "It would be impossible," says one of his missionary fathers of him, "to find in history an instance of a more intrepid and invincible courage than that of the *Sieur de la Salle*. He was never cast down, and he constantly hoped, with the aid of heaven, to accomplish his enterprise." He did accomplish it, and discovered and founded the colony of Louisiana, now one of the United States; but he did not live to enjoy his discovery. If French gaiety and light-heartedness accompanied the course of his discovery, a French tragedy closed it. He was murdered by a clique of his own men. Poor La Salle certainly claims our pity as much as any one we know of: he so little deserved his fate. He was so perfectly unfitted to be the mark of an assassin. A murderous knot amongst his own followers, however, having killed in revenge some of their own companions, feared La Salle's discovering the crime.

"As the conspirators had begun the work of blood, they laid a scheme on the spot for destroying the *Sieur de la Salle*, in conformity, it may be, with a previous design, and under the dread of suffering the just punishment of their guilt at his hands. They deliberated on the method of doing it for two or three days. Meantime La Salle expressed anxiety at the long absence of Moragnet, and seemed to have forebodings of some unhappy event, for he asked whether Duhaut and his associates had not shown symptoms of dissatisfaction. He feared, also, that the whole party might have been cut off by the savages.

"Finally, he determined to go himself in search of them, leaving the camp, on the 19th of March, under the charge of Joutel. He was accompanied by father Anastase, and two natives, who had served him as guides. After travelling about

six miles, they found the bloody cravat of Saget near the bank of a river, and, at the same time, two eagles were seen hovering over their heads, as if attracted by food on the ground. La Salle fired his gun, which was heard by the conspirators on the other side of the river. Duhaut and Larcheveque immediately crossed over at some distance in advance. La Salle approached, and, meeting Larcheveque, asked for Moragnet, and was answered vaguely that he was along the river. At that moment, Duhaut, who was concealed in the high grass, discharged his musket, and shot him through the head. Father Anastase was standing by his side, and expected to share the same fate, till the conspirators told him that they had no design upon his life.

"La Salle survived about an hour, unable to speak, but pressing the hand of the good Father, to signify that he understood what was said to him. The same kind friend dug his grave, and buried him, and erected a cross over his remains. 'Thus perished,' says he, 'our wise conductor, constant in adversities, intrepid, generous, engaging, adroit, skilful, and capable of anything. He who, during a period of twenty years, had softened the fierce temper of a vast number of savage nations, was massacred by his own people, whom he had loaded with benefits. He died in the vigour of life, in the midst of his career and his labours, without the consolation of having seen their results.'"

THE BENEFITS RESULTING FROM THE EXISTENCE OF PAIN.

(Concluded.)

THE next morning after this conversation was bright and sunny, and Mr. Dalton proposed that he and his boys should walk down to the inn, and see how the poor soldier's wife and her little child had passed the night. The proposal was hailed with joy by the lads, and immediately each thought what nice things they could take for the mother or her child, that might be fit for them in their present state. Alfred was entrusted with a small packet of tea and sugar; Edmund had received from the nurse a paper of pearl barley, to make a refreshing drink for the poor invalids; while Cyril was carrying a couple of oranges and a sponge cake for the little child. Their mother had more thoughtfully got ready a small quantity of lint and some simple ointment, and, slipping a little Testament and Bishop Hall's Comfort for the Afflicted into the parcel which she gave her husband, she sent them on their errand. They found the poor woman still in much suffering and more anxiety. Her arm, which had been very badly fractured, was much swollen, and had caused her much pain; while the moaning of her poor child had kept her sleepless and in tears throughout the night.

The landlady of the inn had kindly sat up with her through the night, and displayed much tenderness and good feeling in her attention to the poor sufferers.

Mr. Dalton began the conversation, by asking how she had slept, and whether her arm gave her much pain?

"O sir," she replied, "such a night I have had! I think I shall never forget it. I have not closed my eyes for five minutes through the whole night. I shall know how to value a good night's rest better from this time forward. And as for pain—I have not had one moment's freedom from pain since you left. Thank God, it is a little easier now, and I can hardly be thankful enough for the relief. It seems perfect happiness; at least if my poor boy were better."

Mr. Dalton reminded her of the merciful provision, that no pains should be very severe and yet unremitting for any length of time in *this world*, and then inquired if she had all that she wanted, or wished to have a nurse to sit up with her.

"O no, sir, I thank you," she replied, "I want nothing; that kind, good woman," pointing to the landlady, who was just leaving the room, "does for me all that I can wish; I am sure she waits on my poor child as if it were her own—no mother could be kinder to it. You see, sir, she lost a little boy just about the same age, and so, I suppose, she feels a little for my misfortune."

Mr. Dalton expressed his pleasure at finding her as

comfortable as her circumstances would allow, and so, having deposited their little stores of tea, oranges, &c., he and his children left the house.

"Well, boys," said the father, as they walked along towards the vicarage, "what think you of pain now? do you see any good in it? Any advantage resulting from it to that poor woman?"

"O no, papa," said Alfred, "what good has it brought her?—Robbed her of a good night's rest, and not only kept her awake, but kept her in ceaseless agony for twelve hours or more. You surely cannot call these things good?"

"Why no," replied Mr. D., "I do not call them *good*, but surely you yourselves must confess that they have not been without advantage to this poor woman; that she learned the value of many things which she did not know before:—the blessing of comfortable sleep, of health and ease, of the little kindnesses of friends, &c."

"Oh, papa! but that is not giving her any *new* comforts, but only showing what she had before, but did not know the value of."

"Well; and if you have got a gold mine on your estate, but knew nothing about it, am I doing you no kindness if I tell you of it? Or, if a poor man's child was playing with a few small white stones, and I showed the father that they were diamonds, and told him the value of them, am I not doing him a great kindness, even although I give him nothing; but only show him the value of that which he had long had by him?"

"O yes, papa, certainly; you are showing him how to be happy and comfortable for life. He might as well not have these treasures, as not know the value of them."

"Well, so may pain make us ever happy and comfortable afterwards, by showing us the advantages of what we have long enjoyed, but did not know the value of. See a poor child suffering with the tooth ache; unable to eat for fear of increasing the pain; unable to sleep; fretful, and unable to enjoy any pleasure with its playfellows. Apply some remedy which shall relieve his pain, a drop of kreosote, or such like; and see if that boy does not enjoy his game of play, or his next meal, more than all his school-fellows. Just as the lost sheep, which has been found again, gives us more pleasure for the time, than all those which were never lost at all. How often do you go to bed, sleep the whole night through without waking, and never thank God in the morning, for that great blessing of quiet and refreshing rest! And why! because you have the same comfort every night. But pass one night in pain and restlessness upon your bed, or, if not in pain, pass one night without sleep, in a ship or in a carriage, and you will then know the value of a good night's rest; and will never forget to thank God when you have had it. This then is one of the benefits of pain: it teaches you the value of the blessings you have long had, but did not appreciate; though it does not add anything to the intrinsic value of what you had before. A good night's rest, and health, and ease, are like the lost piece of silver which was found again, which is not at all more valuable in itself than it was before: but it caused you much pain when you had lost it, so the recovery of it gives you more pleasure than if you had always had it."

"I see, now, papa," said Edmund, "that you mean that we enjoy our health, our food, or our sleep, much more after we have been for some time without them."

"Yes," said Mr. Dalton, "so much so, that it is remarked by a very sensible writer, that he believes there is more real pleasure, or at least more *enjoyment* of pleasure in the world, because of the existence of pain, than if there were no pain in the world!"

"But it is not only to our bodies that pain is the cause of so much benefit: we must count up the moral benefits of pain also, the good of which it is the occasion to our *minds*."

"Well, papa, that I cannot understand; I thought pain only affected our bodies."

"No. Did you not notice how bravely, with what

fortitude, the old man who broke his collar-bone yesterday, bore his pains?"

"Yes, that I did," said Edmund; "and I was quite pleased to see how much more he thought of others than of himself."

"Well, Edmund," said his father, "if his neck had given him no pain, he would have had nothing to bear, and you would have thought nothing of his attention to other persons. Pain thus teaches us to learn fortitude and patience. We could never be called patient, if we had all we wanted, and had no sufferings of body or mind. But again, see how many kind actions and kind feelings pain is the cause of; how it gives a value to trifles which before were little thought of. A cup of cold water given to a wounded soldier on the field of battle is of more real value to him than gold or silver; a kind look, a visit to a sick friend, a kind inquiry how he has passed the night, the movement of a pillow, the offer of a fresh flower, all these little things are as nothing to the strong and healthy, but to the sick man they are treasures valued more than jewels, for they are what money cannot buy. Were you not pleased to see the kindness of the ladies to the poor woman when the coach broke down?"

"O yes, papa: one lady sat down on the dusty road to support the woman's head; another tore her beautiful lace handkerchief in strips to stop the bleeding of her arm: and that beautiful scarf—I wondered how she could ever wear it again after being used to tie round the broken bone."

"Here, then," said Mr. Dalton, "you see how much good feeling is called forth by pain; rich careful for poor, and forgetting their own rank and station in trying to relieve the sufferings of a poor soldier's wife."

"And the landlady too, papa, how gently and tenderly she behaved to the poor child. I saw a tear drop from her eyes as she was leaning over the child's bed this morning; and I am sure it was quite delightful to hear the sick woman speak of her."

"Yes," said Mr. Dalton; "and the poor woman told us the reason why the landlady felt so much for the child: namely, that she also had lately lost a child of nearly the same age. So, then, here is another benefit of pain: it makes us feel for others when we have suffered it. He who knows the misery of a bad headache can feel for other persons who are suffering from it. How much kindness is expressed, aye, and how much comfort also is derived from that little expression—'Poor fellow! I can feel for you.' So, then, pity, sympathy, gentleness, and kindness,—all these are increased by the existence of pain! The smallest, most trifling gifts are doubled in value because of pain; and this poor man, who, if it depended on wealth and riches, would never do any very valuable service to his neighbour, finds his little attentions valued beyond all price; while, by a kind word, or helping arm, or passing smile, he cheers up a sick friend, and seems to share his pain. But there is another class of benefits arising from pain still to be mentioned, perhaps the most important of all—I mean the *religious* influence of pain. Pain is the best of preachers; it has more power to convince the thoughtless, ungodly man, than the most powerful arguments addressed to his reason. One night of pain and sleeplessness, a few hours of tossing in agony upon a bed, are of more use than twenty sermons to convince the irreligious man and the unbeliever of the weakness of our bodies, and the certainty of death. The bold and daring infidel may refuse to believe, or even to think on death, while confident in health and strength; but put him on the bed of sickness, let him hear the secret whispers of friends around his bed, that there is some danger, and he who mocked at death and a future world, will be heard to ask himself, what is the danger of which they speak thus mysteriously? And, as pain is to the unthinking ever the first monitor, when he will believe, warning him of the shortness of life and the frailty of his body, so is it to the good man the messenger to pre-

pare him for death, and to make him willing to depart out of this world. You heard, my boys, the soldier's wife to-day say, what a wretched night she had passed in constant pain. Do you think she would wish to live many years, if that pain were to continue all her life?"

"O no, papa, she seemed as if she would have given any money to be free from it. I am sure she would rather die than live in the same pain, even for a year."

"Yes," said Cyril, "and I think she would be glad to see her little child die rather than see it live long moaning in agony, and causing her so much anxiety."

"Well, then," said the father, "you see here another good effect of pain: it makes us content to die. Fond as we are of life, and afraid of death, we are often so wearied out by long and racking pain, that death, which we used to look upon with dread, is looked forward to as a blessing, a relief from suffering, a rest from our troubles. If there were no such thing as pain, if men enjoyed the use of all their limbs and senses without any suffering, till the moment when they were to die, and then dropped down in full health and strength, how much more sad should we think it, than now, when we are thus kindly warned of our coming end, and sometimes are so tired out of life by pain, that we do not wish to live any longer! Yes. This also is a merciful effect of pain,—it reconciles us to dying. But there is another effect of pain even more important than this. Pain is the only way by which we can understand the nature of everlasting punishment. When God would describe the nature of that punishment which He has prepared for all the wicked, He has made it known to us under the figure of everlasting burning in fire that never shall be quenched; gnawings of a worm that never dieth; a place of weeping and wailing, and gnashing of teeth. Now, whether it really means that the punishment in the next world will be only the burning in fire and brimstone, which is *only* a punishment to the body, I think you, boys, can see a great benefit in this description of it."

"O yes, papa," said Alfred, "I suppose you mean everlasting pain is a thing which all men can understand, and all would wish to avoid."

"Exactly so. If the punishment of the wicked had merely been described as banishment from God's presence, and from the company of all good men, this the ungodly and worldly man would not have cared for; they would have gone on in their wickedness, nor heeded their everlasting ruin; but now that it is made known under the likeness of everlasting burning, is a state which all can understand; for all men, wicked or good, know what is the nature of pain, and would try to avoid it. So you see, boys, one other great benefit of pain: that we are able to understand the nature of everlasting punishment, and are warned by our own feelings to fly from it; and as we thus dread the thought of a place of eternal torment in everlasting burnings, does it not, on the contrary, teach us to look forward with joy and comfort to the time and place where 'there shall be no more death, neither sorrow nor crying, neither shall there be any more pain!' O could words have been chosen which should better describe to beings of flesh and blood like ourselves a place of happiness, than these which describe Heaven as a place where there shall not be any more pain? Go and tell this in a hospital to the poor groaning, suffering patients there; call out aloud that after a certain hour in the day there should be no more pain, and see whether they would not think this of itself almost a heaven upon earth, in their joy at their relief from present suffering. Yes, great as are the blessings laid up in store for those who love God, and we are sure they will not be merely blessings to our body only, still this is one part of our intended future happiness, one which we all can understand and desire, freedom from pain for ever! And now, I have only one more benefit to tell resulting from pain; that it teaches us to understand and value in some manner the greatness of the mercy of God who

has delivered us from this dreadful sentence threatened against us, of everlasting pain; and who gave His own Son to bear pain, and poverty, and agony for us that we might be delivered from it. When we look at Him beaten, and scourged, and crowned with thorns, nailed by His hands and feet, and pierced in the side, and all this borne by Him for our sake without a murmur, does it not teach us that we ought to learn to bear our little pains more patiently, which are all far less than His, and all richly deserved? We know what He felt, for He had a body of flesh and blood like ours; let us in all our pain think of Him; and if he bore so much pain so patiently for us, let us endeavour to copy His patience, and to bear with meekness and resignation whatever He may please to lay upon us. But look, boys, here we are at home: and here is your mother come out to hear our report of the poor soldier's wife. There, go and tell her whether the poor woman is to be pitied, or whether she has got any good from her late accident, and any benefits from her pain; and whether, if she uses this time aright, she may not say hereafter, 'it is good for her to have been afflicted.' But stop, before you go, let me hear whether you have got your story right; can you tell all the benefits resulting from our liability to pain? And that I may know that you have learnt your lesson quite perfect, begin with those which we discovered last night, and name each of you by turns one of the benefits of pain."

1. "Pain is the never sleeping guardian of our bodies, to put us on our guard either against accidental injury or wilful violence."

2. "Pain has been the cause of increasing our knowledge, our skill, our comforts, our luxuries, while seeking remedies for it, or defences against it."

3. "Pain is the means by which we are able to have dominion over the brute creation, and to subdue them to our will."

4. "Pain teaches us the value of health, ease, sleep, and all our common every-day mercies."

5. "Pain gives us the opportunity of acquiring and exercising fortitude, patience, forgetfulness of self, &c."

6. "Pain calls forth piety, sympathy, and the exercise of many kind and endearing acts of love and tenderness."

7. "Pain brings the rich man down to feel a brotherly compassion for the poor man in the same misfortunes, and raises the poor man to a level with the rich in his power of doing valuable services by the most trifling but well-timed acts of kindness."

8. "Pain warns us of the weakness of our bodies, and reminds even the most ungodly of the *possibility* of death."

9. "Pain, long and severe, reconciles us to death, and makes us even long for it as a release."

10. "Pain is that by which alone all, even the ungodly, are able to understand the nature of everlasting punishment, and to long to avoid it."

11. "Pain, by its severity, teaches us to look forward to that place of everlasting happiness, one of whose features is that there 'shall be no more pain.'"

12. "Pain makes us to understand the greatness of God's mercy in giving His Son to save us from pain, and to know the lovingkindness of that Son who bore so much pain for us."

13. "And, knowing how He felt for us to learn to bear with meekness our own, far less, but more deserved suffering."

"Well done, my boys," said Mr. Dalton; "you have mentioned, I think, nearly all. So now, if ever you, like this poor woman, shall be laid on a bed of pain, you, I trust, will show that you know and believe that these afflictions are 'all for the best;' that they are sent by a kind and merciful Father, not for His pleasure, but for your profit; and that though 'no chastening for the present seemeth to be joyous, but grievous, nevertheless afterwards it yieldeth the peaceable fruit of righteousness unto them which are exercised thereby.'"

POPULAR YEAR-BOOK.

April 10, 1846.—Good Friday.

FROM the earliest period of Christianity, this day has been observed as a solemn fast in memory of the Crucifixion of our SAVIOUR. Its appellation *Good* is of no very remote origin, and appears to be peculiar to the English Church. Our Saxon forefathers called it *Long Friday*, from the length of the offices and fastings on this day; but its ancient title, and that by which it is known in the Western Church, is *Holy Friday*.

OLD AND POPULAR CUSTOMS.

It was formerly the custom of the English monarchs on this day, to hallow with great solemnity certain rings, the touching of which was believed to prevent cramp and falling sickness. This usage took its rise in the mysterious virtue of a ring which had been given by Edward the Confessor to a poor person who had asked alms of him, for the love he bore to St. John the Evangelist; and which, having found its way to Jerusalem, was afterwards brought back to St. Edward by some pilgrims returning from Palestine. It was kept for centuries in Westminster Abbey with much veneration; the Sovereigns of England were thought to be able to impart its virtue to other rings, and there was a peculiar service for their consecration. These were called "cramp-rings," and presented and received with an implicit faith in their sanatory power. Andrew Boorde, in his *Breviary of Health*, 4to, 1557, speaking of the cramp, observes: "The king's majesty hath a great help in this matter in hallowing cramp-rings, and so given without money or petition." Lord Berners, the translator of Froissart, when ambassador to the Emperor Charles V., writing to Cardinal Wolsey, on "the 21st of June, 1518," says, "If your Grace remember me with some cramp-rings, ye shall do a thing much looked for, and I trust to bestow them well with God's grace," &c. In Suffolk, the use of cramp-rings is not entirely abandoned. Instances occur where nine young men of a parish each subscribe a crooked sixpence to be moulded into a ring for a young woman afflicted with fits. In connexion with the cramp, and one of its supposed remedies, we will present our readers with the following charm "for one's foot when asleep," in use in the Blue-coat school, when Coleridge was a little boy there, and ever since its foundation in the reign of Edward VI. It runs thus:

"Foot! foot! foot! is fast asleep!
Thumb! thumb! thumb! in spittle we steep:
Crosses three we make to ease us,
Two for the thieves, and one for CHRIST JESUS!"

The same charm served for a cramp in the leg, with this substitution:

"The Devil is tying a knot in my leg!
Mark, Luke, and John, unloose it I beg!
Crosses three," &c.

"And really," says the poet just mentioned, "upon getting out of bed, when the cramp most frequently occurred, pressing the sole of the foot on the cold floor, and then repeating this charm with the acts configurative thereupon prescribed, I can safely affirm that I do not remember an instance in which the cramp did not go away in a few seconds."

Eggs and apples were anciently connected with Good Friday. A writer in 1579 refers to the custom of "creeping to the cross with eggs and apples." One William Rathe, in 1570, says "that on this day the Roman Catholics offered unto CHRIST eggs and bacon, to be in favour till Easter-day was past." A French

writer in 1679, observes, "that he has known people who preserve all such eggs as are laid on Good Friday, which they think are good to extinguish fires in which they may be thrown." He adds, "that some imagine that three loaves baked on the same day, and put into a heap of corn, will prevent its being devoured by rats, mice, weevils, or worms." In England but one sort of eatable 'remains in association' with the day, namely, *hot cross buns*. These are small cakes, slightly sweetened and spiced, sometimes of a round shape, and sometimes long and tapering at both ends, but always marked on the top with an indentation in the form of a cross. "In London," says a writer before quoted, "as well as in almost every other considerable town in England, the first sound heard on the morning of Good Friday, is the cry of 'Hot cross buns!' uttered by great numbers of people of an humble order, who parade the streets with baskets containing a plentiful stock of the article, wrapped up in flannel and linen to keep it warm. The cry, which is rather musical, is strictly—

' Hot cross buns—
One a-penny, buns—two a penny, buns;
One a-penny, two a-penny—hot cross buns!'

Hucksters of all kinds, and many persons who attempt no traffic at any other time, enter into the business of supplying buns on Good Friday morning. They make a stir no the streets which lasts till Church time, and it is resumed in the afternoon."

Sixty years ago pastry-cooks vied with each other for excellence in making hot cross buns; and there were two bakers' shops at Chelsea, so celebrated for this manufacture, that crowds of customers thronged beneath the flat-roofed wooden portico or piazza which extended along the front of each, during the whole of the day. Several hundreds of square black tins, each containing dozens of hot buns, were disposed of in every hour, from a little after six in the morning till after the same period in the evening. Cross buns resemble, in some respects, the consecrated loaves, bestowed by the Western Church on those who, from any impediment, cannot receive the Holy Eucharist. These are made from the dough from whence the Host itself is taken, marked with the cross, given by the priest to the people after Mass, just previously to the departure of the congregation, and are kissed before they are eaten. It is remarkable, that the loaves of the Greeks were signed with a cross from the earliest periods, and that such were offered to the gods, under a name which in the accusative case is *βουν* (*boun*). Two loaves with an impression of the cross, within which were four other lines, were found in Herculaneum. In the houses of some ignorant persons, a Good Friday bun is preserved "for luck;" and sometimes there hangs from the ceiling a hard biscuit-like cake of open cross-work, baked on Good Friday, to remain there until displaced on the next Good Friday by a similar one. This is deemed a preservative against fire.

A correspondent to the *Every-day Book* states that on Good Friday, in the neighbourhood of West Derby, a custom prevails which is called "paste-egging." Partics of the juvenile peasantry disguise themselves in the most fantastic habiliments—such as clothes turned inside out, with masks, veils, &c., and betake themselves (in numbers of from about four to a dozen of both sexes,) to the different farm-houses, and solicit contributions towards the "festival" of Easter Sunday. These gifts are generally eggs and oatmeal cakes. One of the party usually carries a basket for the eggs, another for the cakes, and a third is the bearer of a small box for pecuniary contributions. They generally cheer their benefactors with some animated songs, and seldom fail to return homeward with a plentiful supply of their "paste-egg," and no trivial aid in money. With these materials a feast is got up on Easter Sunday evening at the village ale-house.

In the midland districts of Ireland, it is a common

practice on Good Friday, with the lower orders, to prevent their children, even those at the breast, from having any sustenance, from twelve on the previous night to twelve on the night of Friday: and it is common to see along the roads between the different market-towns, numbers of women with their hair dishevelled, bare-footed, and in their worst garments. All this is in commemoration of CHRIST'S Passion.

RELIGIOUS OBSERVANCES.

The following rubric occurs in the Roman Missal in the office for Good Friday: "Then let the priest by himself carry the Crucifix to a place prepared before the altar, and bowing his knees fix it there: then taking off his shoes let him approach to adore the cross, bowing his knees thrice before it, and then let him kiss it. Having done so, let him resume his shoes and his chasuble. Then let the ministers of the altar, and afterwards other clerks, and laics approach, two and two, and adore the cross with three genuflexions." "A Constitution" of Giles de Bridport, Bishop of Sarum, A.D. 1256, ordains, "on the day of our SAVIOUR'S Passion, all the parishioners shall come to worship the cross, and to offer according to their inclination." This ceremony is thus described in the "Popish Kingdom":

"Two Priests, the next day following, upon their shoulders bear the image of the Crucifix, about the altar near, Being clad in cope of crimson dye, and dolefully they sing: At length before the steps, his coat plucked off they straight him bring,

And upon Turkey carpets lay him down full tenderly
With cushions underneath his head, and pillows heaped high;
Then flat upon the ground they fall, and kiss both hand and feet,
And worship so this wooden god, with honour far unequal;
Then all the shaven sort fall down, and followeth them herein,
As workmen chief of wickedness, they first of all begin:
And after them the simple souls, the common people come,
And worship him with divers gifts, as gold and silver some,
And others corn or eggs."

An old book, containing the ceremonials observed by the English monarchs, directs the usher to lay a carpet on Good Friday, for the king "to creep to the cross upon:" and a proclamation of the 30th Henry VIII. enjoins on this day, "it shall be declared how creeping to the cross signifieth an humbling of ourself to CHRIST, before the cross, and the kissing of it a memory of our redemption, made upon the cross."

The "setting up" of the Easter sepulchres on Good Friday, appears to have been a general practice in England. In this was placed the Host with a Crucifix, or the Host alone, which was watched, according to the Sarum rite, from Good Friday till early in the morning of Easter Day. Perhaps the most curious "sepulchre" of which we have an account, was that at St. Mary Redcliffe's Church, Bristol, 1471. It is described as "well gilt with fine gold," and comprising, among its decorations, "an image of GOD ALMIGHTY rising out of the same sepulchre, with all the ordinance that belongeth thereto, that is to say, a lathe made of timber and iron work thereto. Item: Heaven made of timber and stained cloths. Item: Hell made of timber and iron work thereto, with devils the number of thirteen. Item: Four Knights armed, keeping the sepulchre, with their weapons in their hands; that is to say, two spears, two axes, with two shields. Item: Four pair of Angel's wings, for four Angels, made of timber, and well painted. Item: the FATHER, the Crown and Visage, the Ball with a Cross upon it, well gilt with fine gold. Item: the HOLY GHOST coming out of Heaven into the sepulchre."—*Barrett's Bristol*, cited by Fosbroke, p. 50, Note.

On the Gospel side of the Chancel, and nearly opposite the sedilia, we generally find an arch forming a recess and canopy to an altar tomb. This was often used as an Easter "sepulchre." Pious persons, in their wills, frequently desired to have their tombs so built as that they might serve for this purpose.

Two of the finest examples of stone "sepulchres"

were at Eckington Church, Lincolnshire, and Hawton Church, Nottinghamshire; these are richly decorated in the style of Edward III. with representations of the Roman soldiers asleep, and other appropriate imagery.

The Good Friday ceremonies we have described, were neglected in the Church of England after the Reformation. As late, however, as the reign of Queen Elizabeth, the following charge occurs in the churchwarden's "accoupts of the parish of St. Helen," Abingdon: "Paid to the bellman for meat, drink, and coals, watching the sepulchre, 19*d*." The anniversary of the Crucifixion is now observed in this country by the suspension of all business, the closing of shops, and a solemn service in the churches, many of which are hung with black, and every ornament is removed from their altars. Some members of the English Church abstain, on this sacred Fast, from any kind of animal food, even from cream to tea; such we are informed by Boswell was the custom of Dr. Johnson. Divine Service is well attended; and it is considered proper to appear at church in "sad-coloured" clothes.

Our space will not admit of our describing at length the rites still associated with Good Friday in Roman Catholic countries. In some, we are told, the lights are suddenly extinguished at the sound of a bell, and a flagellation commences in the dark, in imitation of CHRIST'S sufferings. At Jerusalem, the monks go in procession to Mount Calvary with a large Crucifix, and there perform a representation of the "descent from the Cross." In Portugal is acted, in the churches, the whole scene of the crucifixion: the coming of Nicodemus and St. Joseph of Arimathea; the taking down by order of Pilate, and bringing the body in procession to the tomb. At Seville, after a few preparatory prayers, and the dramatized history of the Passion, the officiating priest (the archbishop at the cathedral), in a plain albe, takes up a wooden cross six or seven feet high, which, like all other crosses, has for the last two weeks of Lent, been covered with a purple veil, and, standing towards the people, gradually uncovers the sacred emblem, which both the clergy and laity reverence upon their knees. After some other ceremonies, the service terminates abruptly; all candles and lamps are put out; and the tabernacle, which throughout the year contains the Blessed Sacrament, being left open, every object bespeaks the desolate and widowed state of the Church, from the death of the SAVIOUR to His resurrection. Thousands of English travellers have witnessed, and many described, the splendid pageant of the night of Good Friday at St. Peter's at Rome. The hundred lamps which burn over the Apostle's tomb, are then extinguished, and a stupendous cross of light appears suspended in the immense dome of the Cathedral, between the altar and the nave, shedding over the whole edifice a soft lustre to the eye, and highly favourable to picturesque representations.¹ "The magnitude of the cross," says the author of *Rural Life in England*, "hanging as if half-suspended, and like a meteor streaming in the air: the blaze that it pours forth; the mixture of light and shade cast on the pillars, arches, statues and altars; the crowd of spectators placed in all the different attitudes of curiosity, wonder, and devotion; the processions, with their banners and crosses gliding successively in silence along the nave, and kneeling around the altar; the penitents of all nations and dresses collected in groups near the confessionals of their respective languages; a cardinal occasionally advancing through the crowd, and, as he kneels, humbly bending his head to the pavement; in fine, the pontiff himself without pomp and pageantry, prostrate before the altar, offering up his adorations in silence, form a scene singularly striking."

(1) We are informed that the suspension of this luminous cross has been recently discontinued.

Poetry.

In Original Contributions under this head, the Name, real or assumed, of the Contributor, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

MY COUNTRY HOME.

By ANNABEL C—

"If thou art worn, and hard beset
With sorrow that thou would'st forget;
If thou would'st read a lesson that would keep
Thy heart from fainting, and thy soul from sleep
Go to the woods and hills!—no tears
Dim the sweet look that Nature wears."

LONGFELLOW.

PLEASANTLY, pleasantly flows away my life,
Far from the city's din, from trouble and from strife;
Like a stream it flows along,
Singing to itself a song,
Through fields full of flowers;
Where the trees, with looks of love,
Spread their whispering leaves above,
Through long summer hours.

Tranquilly, tranquilly, even thus I live,
While everything around me doth a fragrance give.
In everything there's joy for me;
In the land and in the sea,
In the boundless sky,
In each little smiling flower
Peering from its shady bower,
Doth a beauty lie

Beautiful, most beautiful, on the summer day,
To watch the cloudy shadows o'er the green hills play:
And how very dear to me
The green fields' tranquillity
In the summer eves,
Or the wood's long dusky aisles,
Where here and there the sunbeam smiles,
Through the roof of leaves!

Quietly, quietly pass away my days,
While a holy light of gladness ever round me plays:
A light within the spirit,
Which those happy ones inherit
Who hear glad Nature's voice,
Bidding their souls arise
From earth unto the skies,
Making the heart rejoice.

But think not sorrows *never* come
Unto my happy home;
There is no place in the broad earth
Where they have not their birth;
But that they seldom, seldom shed
Their shadows o'er my head;
And there is in Nature's voice that will
Bid the vexed soul be still.

For when I'm sad, when dark unrest
Throbs in my troubled breast,
I wander forth mid tree and flower,
And mighty is their power:
For their sweet voices speak to me,
Shedding their own serenity
Into my soul, until they bid depart
The aching at my heart;
Or teach me with a quiet mind
To bear and be resigned,
Patiently waiting till the clouds pass by
That dark my spirit's sky,
And the bright sun which lies concealed
Is once again revealed:
For each fair flower bends down its head,
While the storm sweeps o'er its bed.
And when again the broad bright sun
Its place in heaven hath won,
Smiling, that flower looks up again,
Forgetful of its pain.

Thus Nature speaks to all that will
Hear her voice clear and still;
And those who live among her ways,
Far happier spend their days

Than those who strive, and yet in vain,
A happiness to gain,
Shut in close cities where the air
Is like a weight to bear.

Hers is a calm and holy voice,
Bidding the soul rejoice;
Making our happiness more pure,
Our griefs less to endure.
May my home ever, ever be
Where her dear voice may speak to me!

THE ORPHAN MAID.¹

NOVEMBER's hail-cloud drifts away,
November's sun-beam wan
Looks coldly on the castle grey,
When forth comes Lady Anne.

The orphan by the oak was set,
Her arms, her feet, were bare;
The hail-drops had not melted yet
Amid her raven hair.

"And, dame," she said, "by all the ties
That child and mother know,
Aid one who never knew these joys,—
Relieve an orphan's woe."

The lady said, "An orphan state
Is hard and sad to bear;
Yet worse the widow'd mother's fate
Who mourns both lord and heir.

Twelve times the rolling year has sped
Since, while from vengeance wild
Of fierce Strathallen's chief I fled,
Forth's eddies whelm'd my child."

"Twelve times the year its course has borne,"
The wandering maid replied,
"Since fishers on St. Bridget's morn,
Drew nets on Campsie side.

St. Bridget sent no scaly spoil;
An infant well-nigh dead
They saved, and rear'd in want and toil
To beg from you her bread."

That orphan maid the lady kiss'd,—
"My husband's looks you bear;
St. Bridget and her morn be bless'd!
You are his widow's heir."

They've robbed that maid, so poor and pale,
In silks and sandals rare;
And pearls, for drops of frozen hail,
Are glistening in her hair.

Walter Scott.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

ADVENTURE WITH A BOA CONSTRICTOR.

CAPTAIN C., of her Majesty's 87th Foot, was one of the most indefatigable sportsmen I ever met with, and the entire of his time that could be spared from regimental duty, was passed in the jungle. He was a man of vast personal strength, could undergo any degree of fatigue; in short, possessed a perfectly iron constitution. His habits, too, were anything but luxurious—a single attendant carrying a rifle of large bore, a small carpet to sleep on, a limited stock of linen, and a good supply of ammunition, accompanied the sportsman, who pursued his game by day, and at night sought shelter in some village, perfectly careless as to his accommodations in the way of food or lodging, his beverage being moreover the simple element, for he never carried with him supplies of any kind, trusting his commissariat aid to

(1) See Engraving, page 385.

Providence and rural hospitality. In this manner Captain C. became well known to the natives of the country in every direction where sport was to be obtained; he was sufficiently acquainted with their language to make himself understood, and the kindly simplicity of his manner attached them to his person, and many of them indeed have been known to walk miles to give him early information of large game, which were his favourite objects of pursuit. Captain C. was thus quite "at home" in the Wynaud jungle and great western ghauts, where he probably brought to bag single-handed more head of large game—elephants, bisons, tigers, and the like, than any other man ever did before, or ever will again in India. When upon one of these excursions Captain C. happened to be passing the night in a small village in the Wynaud jungle, a ryot, who had been out very late searching for a stray bullock, came to tell him of a large cheetul, or spotted deer, which he had watched to its lair. He had also heard from the villagers that a huge snake had been seen several times in the neighbourhood. He started accordingly after his game at day-break, accompanied by the villager and a favourite dog, which rarely left his heels unless when ordered. After proceeding about a mile through very dense jungle, and being, as the villager supposed, near the spot where the cheetul had lain down, Captain C. of a sudden missed his dog, and hearing a rustling in the bushes about ten yards off, accompanied by a whimpering noise, he turned in that direction, and saw what he at the first glance took for a tiger, from its colour, a mixture of black and brown, but soon discovered what the monster really was, an enormous boa constrictor, which had seized his poor Juno, and was at the moment crushing her to atoms in its terrible coils. The native who was with him saw what it was likewise, and immediately fled. Captain C. afterwards described the appearance of the reptile, when thus coiled round his dog, as something resembling a barrel, every portion in violent muscular motion, and he distinctly heard the bones of the poor animal crack in succession within its terrible embrace. At last the monster raised his head and fixed two glaring eyes on Captain C., who, in another moment, might perchance have been fascinated by their deadly gleam, but with unerring aim he placed two balls in its forehead. The effect was not, however, as he expected, fatal; and the snake, instantly uncoiling itself from its victim, came straight at Captain C., who of course took to flight; but so thick was the jungle, that he found the animal gaining on him, from the noise it made amongst the bushes, and therefore sought shelter in a tree, re-loading his gun with all possible expedition. Whether the reptile followed him by sight or smell he could not judge, but Captain C. was only just prepared for a second discharge, when the boa reached the tree, and instantly twisting itself around the stem, would have soon seized him, but fortunately at the next shot he blew out both his eyes with a charge of B B: yet, though the snake appeared for a moment stunned, it still continued its efforts to reach him, until by repeated shots it was incapacitated from rising; not, though, till Captain C. had completely emptied his powder flask; and he even then did not venture to descend, as the reptile continued coiled round the tree, occasionally by a muscular movement showing that its vital powers were not yet wholly extinct. At length, after some hours' solitary confinement on his perch, and shouting until he was hoarse for aid, Captain C. had the satisfaction to see a number of villagers arrive, by whom the monstrous animal was soon completely destroyed. Captain C. had no means of accurately measuring its length but by a piece of stick, which the natives said was a cubit long, and he declared that it measured upwards of 30 of these, and was much thicker than one of his own thighs, which were of a make that would have well become the leather *for-shames* of any life guardsman! The head of the boa was cut off by his orders, and sent to the Hon. Mr. Cole, then president of Mysore; and its enormous jaws still may possibly be in

existence at the Mysore Presidency.—*Madras United Service Gazette.*

CONSOLATION IN THE PROVIDENCE OF GOD.

"WHATEVER way I turned," says Mungo Park, in one of his Travels, "nothing appeared but danger and difficulty. I saw myself in the midst of a vast wilderness, in the depth of the rainy season, naked and alone, surrounded by savage animals, and men still more savage. I was five hundred miles from the nearest European settlement. At this moment, painful as my reflections were, the extraordinary beauty of a small moss irresistibly caught my eye. I mention it to shew from what trifling circumstances the mind will sometimes derive consolation; for though the whole plant was not larger than the top of one of my fingers, I could not contemplate the delicate conformation of its roots and leaves without admiration. Can that Being, thought I, who planted, watered, and brought to perfection in this obscure part of the world, a thing which appears of so small importance, look with unconcern upon the situation and sufferings of creatures formed after His own image?—Surely not. I started up, and disregarding both hunger and fatigue, travelled forward, assured that relief was at hand; and I was not disappointed."

It was from a private meeting that "The French Academy" derived its origin, and the true beginners of that celebrated institution assuredly had no foresight of the object to which their conferences tended. Several literary friends at Paris, finding the extent of the city occasioned much loss of time in their visits, agreed to meet on a fixed day every week, and chose Courart's residence as central. They met for the purposes of general conversation, or to walk together, or, what was not least social, to partake in some refreshing collation. All being literary men, those who were authors submitted their new works to this friendly society, who, without jealousy or malice, freely communicated their strictures; the works were improved, the authors were delighted, and the critics were honest! Such was the happy life of the members of this private society during three or four years. Pelisson, the earliest historian of the French Academy, has delightfully described it: "It was such, that now, when they speak of these first days of the academy, they call it the golden age, during which, with all the innocence and freedom of that fortunate period, without pomp and noise, and without any other laws than those of friendship, they enjoyed together all which a society of minds, and a rational life, can yield of whatever softens and charms."—*D'Israeli.*

It is but reasonable to bear that accident patiently which God sends, since impatience does but entangle us, like the fluttering of a bird in a net, but cannot at all ease our trouble, or prevent the accident; it must be run through, and therefore it were better we compose ourselves to a patient than to a troubled and miserable suffering.—*Bishop Jeremy Taylor.*

It is better to be born with a disposition to see things on the favourable side, than to an estate of ten-thousand a-year.—*Hume.*

CORAL REEFS.

AMONG the various alterations which are continually taking place in the surface of our globe, perhaps the most important, because the most lasting, are those which are brought about by the most insignificant instruments. The volcano devastates and the earthquake overthrows; but in time, a fresh soil accumulates upon the once burning lava, and a new vegetation springs up; the island, which burst forth from the depths of the ocean, remains for a few years, and then disappears again. Not so with the achievements of the coral insect; by its labours are built up islands for the habitation of man; by its countries are united,

and seas become dry land. We might speculate widely on the changes thus wrought, but we will first take a short view of the structure and distribution of coral reefs, according to the theory of Mr. Darwin, whose manner of treating the subject renders it highly interesting. Mr. Darwin says,—

“Without any distinct intention to classify coral reefs, most voyagers have spoken of them under the following heads: ‘lagoon islands,’ or ‘atolls;’ ‘barrier’ or ‘encircling reefs;’ and ‘fringing, or shore reefs.’ The lagoon islands have received much the most attention; and it is not surprising, for every one must be struck with astonishment, when he first beholds one of these vast rings

of coral rock, often many leagues in diameter, here and there surmounted by a low verdant island with dazzling white shores, bathed on the outside by the foaming breakers of the ocean, and on the inside surrounding a calm expanse of water, which, from reflection, is of a bright but pale green colour. The naturalist will feel this astonishment more deeply, after having examined the soft and almost gelatinous bodies of these apparently insignificant creatures, and when he knows that the solid reef increases only on the outer edge, which day and night is lashed by the breakers of an ocean never at rest."

Several theories have been advanced upon this subject, but they have been found insufficient. Mr. Darwin's is, that both in atolls and barrier reefs, the foundation has subsided while the reefs have grown upwards. This theory has been objected to since the publication of Mr. Darwin's book; but the objection seems to relate merely to the depth at which the reef-building insects flourish; which, according to our author, is very limited. Let us take a description of an atoll, and we shall see the difficulty arising from this very supposition.

Keeling, or Coco atoll (we abridge from Mr. Darwin), is situated in the Indian ocean, a short distance south of Sumatra. Its greatest width is nine miles and a half. It is a ring, enclosing the lagoon on all sides, except at the northern end, where there are two open spaces, through one of which ships can enter. The reef varies in width from 250 to 500 yards; its surface is level, or very slightly inclined towards the lagoon, and at high tide the sea breaks entirely over it; the water at low tide thrown by the breakers on the reef, is carried by many narrow and shoal gullies, most of which intersect the line of reef at right angles, into the lagoon; a return stream sets out of the lagoon at the main entrance. The outer margin consists of porites, which, not being tidal animals, require to be constantly washed by the breakers, and are destroyed by a very short exposure to the rays of the sun. Where this had occurred, Mr. Darwin found the insects in the uppermost cells all dead; but lower down on the side they were living, and formed a projecting border round the upper and dead surface. The coral, being thus checked in its upward growth, extends laterally, and hence most of the masses had broad, flat, dead summits. On the outer margin of the reef was also a millepora, which grows in thick plates intersecting each other, and forming an extremely strong mass; the outside plates alone being alive. The rugged sloping surface round the external margin seems formed of great masses of living coral, fragments of which had been cast on the beach during gales, and were found to be of various kinds. On the margin of the reef, close within the line of the dead porites, there are other species which seem to require to be bathed during the greater part of each tide by *breaking water*, as they are not found in protected hollows; these form a fringe of two or three feet in thickness, and about twenty yards in width, like an artificial breakwater.

The islets on the reef are first formed through an accumulation of a pile of fragments thrown together by some unusually strong gale. Their ordinary width is under a quarter of a mile, and their length varies from a few yards to several miles. The highest part is towards the outer margin, whence the surface slopes gently to the shores of the lagoon, where the little waves heap up sand and fragments of thinly branched corals.

The lagoon of Keeling atoll is much shallower than that of most atolls of considerable size. The southern part is almost filled up with banks of mud, and fields of coral both dead and alive; but there are considerable spaces of great depth. The corals are very different from those on the outside; most of them have thin branches. These interior reefs are irregular in form, and have not a solid flat surface of dead rock, like that surrounding the lagoon; nor are they so hard, as, ten years since, the inhabitants made a channel through them with crow-bars, in order to float out a schooner, built on one of the islands. This channel, when Mr.

Darwin saw it, was almost choked up with living coral, so that no vessel could pass through it.

On several of the islets, only young cocoa-nut trees were growing on the extremities, while older and taller trees rose in regular succession behind them; which shows that the islets have lately increased in length; probably by the channels being filled up by fresh coral, or by sandy accumulations. These appearances indicate an increase of the atoll; there are others which seem to show the encroachment of the water.

In several places, old cocoa-nuts were falling with their roots undermined, and there were rotten stumps of others upon the beach, where the inhabitants affirmed the cocoa-nut could not now grow. Also, near the settlement, were the foundation-posts of a shed, now washed by every tide, but which, the inhabitants stated, had seven years before stood above high-water mark. Hence Mr. Darwin inferred, that probably the whole had lately subsided in a small degree; and this inference was strengthened by the circumstance that the island had been shaken by an earthquake two years previously. As to the future, if left undisturbed the islets may still extend in length; but the conversion of the lagoon into land must be very slow, as the constant deposition of sediment by fish and molluscs, which are very numerous there, checks the growth of coral reefs, so that these two agencies cannot act together with full effect in filling it up.

This description of the structure of Keeling atoll applies to nearly all the atolls in the Pacific and Indian oceans. There are seldom more than two or three channels, and generally only one leading into the lagoon of sufficient depth for a ship to enter. In small atolls, there is usually not even one.

In the Maldiva group, the atolls are so related to each other in form and position, that at the first glance one is led to suspect that they have originated in the dismemberment of a single one; the theory of subsidence, with the upward growth of the coral, modified by accidents of probable occurrence, will account for the occasional dismemberment of large atolls.

"Barrier" reefs are those which encircle islands, as in the Society Archipelago, where they generally lie at the distance of from one to one-and-a-half miles, and occasionally even at more than three miles, from the shore. The central mountains are generally bordered by a fringe of flat, and often marshy, alluvial land, from one to four miles in width. This fringe consists of coral sand and sediment thrown up from the lagoon channel, and of soil washed down from the hills. In some cases the lagoon channels are open, with a level bottom of fine sand; in others they are choked up with reefs of delicately branched corals, of the same general character as those within Keeling atoll. These either stand separately, or more commonly skirt the shores of the included high islands. Some barrier reefs have very few islets on them; others are surrounded by numerous ones; and some form a single linear strip. Sometimes a part of the reef lies under water, dead, and covered with sand. The breaches in the reefs generally occur in front of the main valleys of the encircled island; the rivers bring down from the mountains mud, and other substances, which, being carried out to sea by the current, not only keep the breach open, but prevent the growth of fresh coral. The islands lying within reefs of this class are of various elevations; their number likewise varies. In the Gambier group there are four large, and some smaller islands within one reef; within that of Hogoleu nearly a dozen small islands are scattered over the expanse of one vast lagoon. Thus, an encircling barrier reef is a large atoll containing one or more islands; the reef being either, in an early stage of formation, a ring of corals; or, in a later stage, a circle of linear coral islets crowned with tall cocoa-nut trees.

The barrier reefs of Australia and New Caledonia are of greater extent, lying, the former from eight to sixteen miles from the shore, and the latter from twenty to seventy.

The third division of the subject comprehends "fring-

ing, or shore reefs;" of which those that border the island of Mauritius are a good example. These lie from half a mile to three miles from the shore; but even in the last case the inclination of the coast land, and the soundings outside the reef, prove that the basis of the latter does not lie at a greater depth than that at which the coral builders can work. Many islands and continents are fringed by similar reefs. Where the sea is very shallow, as in the Persian Gulf, and in parts of the East Indian Archipelago, they lose their fringing character, and appear as separate and irregularly scattered patches, often of considerable area. Fringing reefs are almost universally breached where rivers and even streamlets enter the sea.

Respecting the depth at which reef-building insects can exist, Mr. Darwin thinks it is partly determined by the extent of inclined surface which the currents of the sea and the recoiling waves have the power to keep free from sediment, that great enemy to the labours of the little workman; and that we may conclude that, in ordinary cases, reef-builders do not flourish at greater depths than between 23 and 30 fathoms.

The theory most generally received on the formation of atolls, is that they are based on submarine craters; but there are many objections to this. Atolls are of various forms, some five times as long as they are broad, others narrow and crooked; some loopshaped and many together, others made up of numerous ring-formed reefs; these can scarcely have been volcanoes, and it is also not a little improbable, that there should have existed as many craters of immense size crowded together beneath the sea, as there are now in some parts atolls. If the rim of a crater afforded a basis at the proper depth, a perfectly characterised atoll might be formed, but the greater number cannot thus have originated.

From the two circumstances,—first, the reef-building corals flourishing only at limited depths,—and secondly, the vastness of the areas interspersed with coral reefs and coral islets, none of which rise to a greater height above the level of the sea than that attained by matter thrown up by the waves and winds,—Mr. Darwin advances the supposition that there has been a gradual subsidence over large areas. We know that this has been the case in countries now in existence; and, as we likewise know that there are at present areas gradually rising, as Scandinavia, Peru, &c., we may well suppose that there are others slowly sinking; so slowly, and in such parts of the world, that tradition does not bring down any record of the changes. Besides, in the case of subsidence, it would probably be attributed to some uncommon tide, or high gale. Islands have been apparently washed away during hurricanes, and to this many legends point. We have also proofs of great changes in many of the islands and reefs of the Pacific since they were first discovered, which can be referred to subsidence alone. Let us suppose an island surrounded by a "fringing reef," based upon the low shelving shore. As the island sinks down, either a few feet at a time, or quite insensibly, the living coral, bathed by the surf on the margin of the reef, will,—from what we have shewn of such a situation being the most favourable to its growth,—soon regain the surface. The water will gradually encroach on the shore as the island subsides, and in time the reef becomes a barrier reef with islets upon it; the detritus of the rivers keeping channels open between them, though at some distance now from the shore. As the island continues to subside, the power of the fresh water currents is lessened, the mud, &c. is deposited within the reef, and the channels made by the small streams are filled up by the undisturbed growth of fresh coral.

Let the island continue subsiding, and the coral reef will continue growing up on its own foundation, whilst the water gains inch by inch on the land, until the last and highest pinnacle is covered, and there remains a perfect atoll. If the shore of a continent fringed by a reef had subsided, the result would be a great barrier

reef like that on the N. E. coast of Australia. In each case the form of the reef, and size and position of the channels, would be determined by the outline of the land, the number and force of its streams, and the quality and quantity of the soil brought down by them.

We have seen that corals grow in the interior of an atoll or reef, based no doubt on the subsiding land; these, as long as the same circumstances continue, would remain reefs, but should the subsidence cease, or should the channels in the reef become grown up, and the reef itself be raised high enough to prevent the ingress of the sea, or still more, should any subterranean convulsion appear, the whole atoll, the lagoon, would in time become dry land. Thus Anamouka, one of the Friendly Isles, contains in its centre a salt-water lake, about a mile and a half in diameter, without any communication with the sea, and around it the land rises gradually like a bank: the highest part is between thirty and forty feet, but on this part as well as on the rest of the land, coral rock, like that on the beach, is found. Elizabeth Island, in the Low Archipelago, is quite flat, about eighty feet in height; it is entirely composed of dead corals, forming a honeycombed, but compact rock. Mangaia, in the Austral group, is nearly 300 feet high, with a level summit, "and there are in the central hollow, formerly the bed of the lagoon, many scattered patches of coral rock, some of them raised to a height of forty feet." These knolls of coral rock were evidently once separate reefs in the lagoon of an atoll. This shews elevation following subsidence; and in the East Indian Archipelago, many authors have recorded proofs of the same thing. From the accounts of Capt. B. Hall of the lines of inland reefs, and walls of coral rock worn into caves, above the present reach of the waves, at the Loo Choo islands, there can be little doubt that they have been upraised at no very remote period. Numberless instances of the same kind might be quoted; in most of these volcanic remains are visible.

Thus we approach the unseen agent of this continual change or alteration. In the central parts of the Indian ocean, in the China sea, and in the clustered Archipelagoes of the Pacific ocean, the great areas of subsidence, we must be struck with the absence of volcanoes, while the principal volcanic chains coincide with the presence of fringing reefs. There is not one active volcano within several hundred miles of an Archipelago, or even a small group of atolls. In the Friendly Archipelago, which owes its origin to the elevation of a group of atolls, two volcanoes, and perhaps others, are known to be in action: on the other hand, on several of the encircled islands in the Pacific, supposed by our theory to have subsided, there are old craters and streams of lava, which show the effects of past and ancient eruptions. In these cases it would appear as if the volcanoes had come into action, and had become extinguished, on the same spots, according as the elevating or subsiding movements prevailed.

The immense surfaces which have undergone a change of level during a late period, is a remarkable fact. The existence of continents shows large areas upraised, and in the case of South America, still upraising; the areas are likewise immense which are now subsiding. From the southern end of the Low Archipelago, to the northern end of the Marshall Archipelago, a length of 4,500 miles, as far as is known, every island excepting Aurora, which lies just without the first cluster, is atoll-formed. Thus, "the prevailing movements now in progress, seem to accord with the actual states of surface of the great divisions of the world."

It has now been shown that "an atoll differs from an encircling barrier reef, only in the absence of land within its central expanse, and a barrier reef differs from a fringing reef in being placed at a much greater distance from the land, and in the presence of a deep water space within the reef. It has likewise been shown that reef-building corals cannot flourish beneath a very limited depth;" and to meet these facts the theory of subsidence alone is satisfactory.

It must be remarked as singular that there are no coral reefs on the west coast of Africa; nor, excepting at Bermuda, in the whole central expanse of the Atlantic Ocean. The islands of St. Helena, Ascension, the Cape Verds, St. Paul's, and Fernando Noronha, are entirely without reefs, although they lie far out at sea, are composed of the same ancient volcanic rocks, and have the same general form with those islands in the Pacific, the shores of which are surrounded by gigantic walls of coral rock.

Thus far we have followed Mr. Darwin; his theory is as reasonable as his manner of stating it is clear and interesting; there are, however, considerations upon which it did not lie within his purpose to touch, although they strengthen his theory. In an old pamphlet by Governor Pownall upon the currents of the Atlantic Ocean, is this passage:—

"If two lines are drawn across the Atlantic Ocean, one from the southernmost part of the Canaries to Halifax, in Nova Scotia; the other from the northernmost part of the Madeiras, by the Azores to Cape Race in Newfoundland; the space contained within these lines, will be found, *in fact* and truth, to be a broken line of islands, rocks, breakers, and banks. Now as these visible rocks must have their base on some elevated ground; as the breakers must be occasioned by some sunken rocks or elevated ground; and as the banks must shoal off gradually, howsoever steep; the ground within this space thus crossing the Atlantic, is in strict fact an elevated, though broken line of ground."

This observation carries us back to the ancient tradition of a large submerged continent, lying in the Atlantic Ocean, which was believed to have disappeared in one night, having been swallowed by the sea during an earthquake. This tradition is traced from Plato and other ancient writers back to the Egyptian priests, whose means of information we can scarcely guess at. The grassy sea also, which extends between the parallels of 18° and 33° north latitude, covering nearly 60,000 square leagues, gives the supposition of submerged land, though at a depth which can neither be sounded nor calculated. That this is not table land may be inferred from the currents which set out from the Gulf-stream in a northern and eastern direction, perhaps following breaches in the submerged land. The general current of the Gulf-stream follows the line Mr. Pownall mentions, in a southerly curve towards the African coast; but there are currents setting east, between the islands Pico and St. Michael of the Azores, and between the Madeiras and the Canaries. Cocoanuts and other tropical substances have been found thrown upon the Shetland and Orkney Islands, after violent storms. We know that the voyage from America is much more rapid than that to the New Continent; and American sailors say that "the course is down hill all the way."

If we reflect upon all this in connexion with the constant subsidence and uprising now going on in the Pacific Ocean, we may well suppose that the tradition of the ancients respecting Atlantis is not without foundation. The subsidence may for some time have been gradual, but that the disappearance was at last sudden appears probable from the absence of coral about the Cape Verd, and other African islands, the links between the lost land and the present continent. At the American end of the bank mentioned by Mr. Pownall, lie the Bermudas, the connecting link to the American continent, and respecting these there are some curious facts. The islands stand on one side of a coral bank or reef, around which is a border of gradually shoaling water, nearly a mile and a half in width; whereas, on the exterior of other atolls or barrier reefs, there exists a narrow shelving margin, beyond which the ocean becomes suddenly unfathomable. The size, height, and extraordinary form of the Bermudas, present little resemblance to the long, narrow, simple islets of the atolls in the Indian and Pacific Oceans. There are also evident proofs that islands like the existing ones formerly

extended over other parts of the reef. The land upon a true atoll does not exceed thirty feet in height; the highest point of the Bermudas is 260 feet, and there occur in one place, five or six layers of red earth, interstratified with the ordinary calcareous rock, and including stones too heavy for the wind to have moved, without having at the same time utterly dispersed every grain of the accompanying drifted matter. This is curious, and though, perhaps, not to be taken as "confirmation strong" of the dream of an Atlantis, yet, when connected with other facts, it may lead future investigators in the track of elucidation.

There are many curious facts in other branches of natural history connected with the Atlantic islands, which we shall take an early opportunity of noticing, as they bear, though collaterally, upon our present subject.

The coral formations of the Red Sea, also require separate attention, on account of their connexion with the ancient historians.

F. C. B.

ST. LOUIS, KING OF FRANCE.¹

(Concluded.)

In the year 1247, the King departed for the Holy Land. The experience of previous expeditions had taught the Crusaders that Egypt was the key to Palestine: or at least that the latter country, if conquered, could never be retained while Egypt remained in the hands of the enemy. It was, therefore, determined to descend upon the Egyptian coast, and Louis, with his Queen, his three brothers, the Counts of Artois, Poitiers, and Anjou, and other great nobles, journeyed down the Rhone, and embarked at Aigues Mortes on the twenty-third of August. The barons had been previously assembled in Paris, and sworn fealty to their sovereign's children in the event of his never returning to his native land. The people prayed for blessings on his head, and the clergy chanted solemn hymns. The fleet made for Cyprus as their first point of destination, and the passage was considered, for the times, a favourable one, being accomplished in about five weeks. During the time of their sojourn in the island, various embassies were received, and the Empress of Constantinople (the wife of Michael Palæologus,) being accidentally driven on shore by stress of weather, was treated with all the respect and courtesy befitting her high station. The Sultan of Iconium, considered the most powerful ruler in heathendom, was to be kept in check by the forces of Armenia: such at least was the promise received from that country; and the Khan of Tartary likewise pledged himself to find employment for the Sultan of Bagdad, with whom he was at enmity. The Christian King received the Tartars' ambassadors with great honour, but took care to send back with them some priests and other Franks, who bore to the Khan a most costly tent, resembling in its form a chapel, and adorned with sculptured representations of the Annunciation and similar events, in the hope that the Khan might, from interest in the beauty of the adornments, be led to inquire concerning their subjects, and thus ultimately brought to the faith of the gospel.

On the Friday before the feast of Pentecost took place the embarkment for Egypt; but the wind rose, and a storm ensued, so wild and fearful, that the vessels got separated in all directions, and of three thousand knights a third portion only could keep company with the King as Damietta rose in sight. The Sultan's force was drawn up along the beach, "*a goodly race to see*," says Joinville, for they had much gold armour which glistened beneath the morning sun. As the fleet drew nearer, a harsh and terrible clang of cymbals greeted their ears: and the bravest paused, and questioned whether it were prudent, with such diminished numbers, to attempt a

¹ To the list of authorities for the former part of this article may be added Velly, *Histoire de France*, Tom. III. William of Nangis has likewise been referred to in corroboration of one or two particulars.

landing. But Louis, who, doubtless, knew well the feats of arms which Philip Augustus and Richard of England had performed against such foes, was not the man to let the first impression of dread which an invading army creates, die away by waiting till fresh vessels could rejoin him. At his command the Oriflamme was unfurled, and the result justified the seeming rashness of the deed. The defenders of the coast were gallantly and effectually repulsed; courage more than atoned for the disparity of numbers, and, in a few hours, the carrier-pigeons were flying to the Sultan (who had not been present in person) to announce that all was lost, and the royal standard of France now floated over the towers of Damietta; while the Te Deum was chanted by the Christian host in thanksgiving for their great and glorious victory.

The rising of the Nile (for it was now June) compelled some months' sojourn at Damietta before the army could proceed to Cairo, and this time the king employed in fortifying the city to the utmost of his power. Two-thirds of the plunder had, in such cases, been usually distributed among the army; and the refusal of Louis to act thus, combined with his strict preservation of the magazines and military stores, caused much discontent. But he remained firm, and subsequent events showed the prudence of his course. Indeed the melancholy confession of his biographer respecting the employment of such portion of the plunder as was allotted to the Crusaders, proves how hopeless a task it was to keep alive in the breasts of the many that flame of pious enthusiasm which actuated the few. "*What God hath in his word recorded of the Israelites, was but too true of us,*" writes Joinville; "*'yea, they thought scorn of that pleasant land; and forgot Him who granted them this conquest.'*" Their time and money were spent in wanton waste, in feasting and debauchery: all overtures from adversaries were rejected without consideration; for the soldiers, flushed with success, would not listen to them, and only waited to march, as they believed, to fresh and certain triumphs.

The time for action arrived. The Franks must have been already reinforced by the arrival of many of those vessels (originally as many as 1800 in number) which the tempest had separated. It does not appear what amount of diminution had been sustained in the army, which reckoned, at the commencement of the expedition, 2,800 knights and 50,000 ordinary troops. But the Sultan now came up with all his chivalry to oppose their further progress; the Bedouin tribes were collecting to assist the Saracens; and natural impediments were also to the disadvantage of the knights of Christendom, who had to make their own roads, and cross, with great difficulty, some branches of the Nile. And a new and terrible foe to the Franks now appeared in the Greek fire, which was employed with tremendous effect by the enemy. This curious compound, scarcely less formidable than gunpowder, had, in former years, twice saved Constantinople from the hands of the barbarians; but the secret of its composition had been stolen by the infidels, and was now used against those who were ignorant of its nature. It is considered by those who have most fully investigated the subject to have been a compound of naphtha, resin, and bitumen. Water only added to its virulence: the best extinguisher was sand. With such an instrument of warfare upon one side only, it is no marvel that knights, who despised the lances of the Saracens, should confess their dread of its powers. "It was discharged," says the seneschal, "from a kind of catapult, and, descending in the darkness like a dragon of flame, displayed the whole army, as if it were day." Even Louis, who, Protesilaus-like, had been the first to leap on shore before Damietta, felt fear, though less for himself than his subjects; and, at each fresh discharge, threw himself with tears upon his couch, saying, "Lord, guard thou my people!" But when, by day, fair fight could be obtained, the state of affairs was far different; in this, as in former expeditions, the losses on the part of the Cru-

saders "were least in the field of battle; the intrinsic superiority of European prowess was constantly displayed; the angel of Asia, to apply the bold language of our poet, high and unmatchable where her rival was not, became a fear; and the Christian lances bore all before them in their shock."¹ A Bedouin showed a ford over a branch of the river which had presented much difficulty of passage: the King, with his three brothers, passed, leaving the Duke of Burgundy behind, with a portion of the army as a reserve. In the battle which shortly ensued, the pride of the Templars (so vividly impressed upon the minds of English readers by the tales of Ivanhoe and the Talisman,) exhibited itself, and they contested the right of precedence with the Comte d'Artois. But the latter being a soldier of fiery temperament, put a practical close to all discussion, by charging the enemy with such vigour, that he soon put to flight that wing which confronted his own division, and commenced a hot pursuit. The Templars perceived the rashness, but the spirit of honourable valour overcame their pique, and numbers joined him in the chase. Fast and far fled the Saracens and Mamelukes, till the walls of Massoura received their flying troops; and there, cheered by the presence and aid of their countrymen, they rallied, and the narrow streets, from which missiles were on all sides showered down, proved fatal to the rash pursuers. Then, in company with many a gallant knight, fell Raoul the Lord of Coucy, and the Comte d'Artois himself; and when King Louis inquired after his brother, he was told that he must not hope to see him again on earth. The King was much affected, but bore the loss as became his own high and consistent character. But such calamities now fell upon the army, as rendered valour and conduct useless: hunger and epidemic disease of scurvy and dysentery came on them, and they were compelled to entrench themselves in a camp. Louis might (even on the testimony of Arab historians) have escaped by water, but resolved to share the danger of retreat with the main body of his forces. The sufferings of that march have seldom been surpassed; but a noble defence was long maintained, in which Charles of Anjou, the Templars under their master William of Souvain, the Count of Flanders, and Guion Malvoisin, were especially distinguished. Yet, at length (although the final blow seems to have been partly caused by treachery), the leader of the host, their sovereign, became a captive; and a similar fate befell another detachment which had, too late, attempted the escape down the Nile: so that the entire army yielded.

Up to this time Louis had played the part of a valiant and skilful general, nor were the disasters which befell his soldiers such as any capacity could have averted. He had now to call into exercise virtues more difficult of attainment—those of passive courage and Christian resignation. Never, perhaps, upon such a theatre, have they been more nobly exemplified. The infidels made a barbarous and insolent use of their victory; treated their prisoners cruelly; and took every possible method of showing their abhorrence and contempt of Christianity. Still, as their one great object was to regain their lost territory, they saw that to put to death the captives would avail them nothing, while Damietta remained impregnable; and, indeed, would rather tempt a fresh invasion to revenge their death. And now king Louis's wisdom, in not squandering the military stores of that city, and resisting the murmurs of his troops, became apparent. To regain Damietta was the dearest wish of the Saracens; but this they felt would never be accomplished, unless by means of treaty, as it was far too well defended and provisioned to afford any real hope of capture by force of arms. Proposals for a treaty were accordingly made: the infidels suggested that certain Christian possessions in Syria should be delivered up; but these the king believed to belong especially to the Emperor of Germany, and there-

¹ Italam.

fore to be beyond his control. "You will consent, then," said his enemies, "to deliver up the territories of the Knights Templars as a ransom." But this could not be, for that society had always made solemn oath that they would never part with any possessions they might acquire in the realms of heathendom, for the sake of saving any prisoners. The Sultan and Emirs, who did not like to parley concerning Damietta until they had at least attempted its capture, were much enraged at the failure of their proposals, and threatened Louis with fetters, and the application of an excruciating torture, called the Bernicles.¹ The king replied, with calmness and dignity, "he was their prisoner; they might deal with him as they would." Perceiving that menaces were of no avail to overcome the resolution of their royal prisoner, and finding a rumour that Damietta had yielded to be false, the Emirs turned to the consideration of a monetary ransom. Louis declared, that, if they would name a reasonable sum, he would write to the queen (who had remained in Damietta) to pay it, but that he would not be answerable for her judgment on the matter; for she was his lady, and should act as she thought right. They suggested, that for himself, he should restore Damietta, and give a million of gold bezants (about 170,000*l.* sterling) for the deliverance of his soldiers. But, during these transactions, a quarrel had sprung up between the Emirs and their sovereign, which ended in the sultan (by name, Al Malec Al Moadheni) being murdered almost before the eyes of Louis, who had no power to save him, and was himself in great danger from the conspirators. The Emirs raised a military chieftain (the man who had rallied their flying forces at Massoura) to be sultan; and, with some exceptions, he observed the terms of the covenant entered into by his ill-fated predecessor. Oaths to be made by either party were drawn up; they were sufficiently characteristic. The Emirs swore that, in the event of their breaking the compact, they would hold themselves disgraced, like Mahometans who made pilgrimage with *bare heads* to Mecca,² or who forsook their wives, and then received them again, or (last and greatest indignity) who eat pork! They required Louis to make oath, that, in case of non-performance of his portion of the treaty, he would esteem himself as one who denied God and our Lady, who is dissevered from the communion of His twelve apostles and His saints, who renounces God and His law, who spits and tramples on the Cross. But the king's scrupulous conscience took alarm at the bare mention of alternatives so shocking: accidents might occur to prevent fulfilment of his intentions, and was he to risk such guilt! No; by God's help that oath he could not take. Again boiled up the wrath of his present masters, and threats of death and torture were rife upon their tongues; and again came forth the same calm reply, "He was their prisoner, they might do as they would; but he would rather die a true Christian, than live beneath the Almighty's wrath." His adversaries then had recourse to a cruelly ingenious expedient: they bethought themselves of employing against the king his own fidelity to the religion of the cross, and respect for its ministers. There happened to be in their camp an aged bishop, who had accidentally fallen into their hands, the patriarch of Jerusalem. Him they bound to a pillar, and tied his hands with cords, till they swelled to thrice their natural size. The old man (he had seen more than eighty winters) could not endure the torment, and cried out, "*Sire, swear as they require; I will take the responsibility.*" and added the obvious consideration, that the *intent* was the real point at issue; and of the king's full intention to keep the

oath there could be no doubt. How this affair ended, Joinville could never learn; but it was finally settled, to the satisfaction of all parties.

The prisoners were now placed in barges, that they might be conveyed to Damietta; but with no regard to their comfort, for Joinville relates that he, and the good Count Peter of Brittany, though both extremely ill, had to sleep with their feet in each others faces. But, before proceeding, it is fit to say a few words on the internal condition of the city, and the sorrows of the poor queen Margaret. The news of her husband's captivity had reached her only three days before her confinement. Overwhelmed with dismay and grief, she would fancy in her dreams that the room was full of Saracens, and awake with loud cries for help. On one occasion she dismissed all attendants but an aged knight, and made him swear that he would slay her sooner than let her fall into the hands of the infidels. The son whom she bore was christened John, but surnamed *Tristan* (*triste*), from the great affliction attendant upon his birth. He was, indeed, "*the child of misery, baptized in tears*;" born when one crusade had failed, he lived to perish in another. The queen, however, seconded her earnest intreaties to all the knights in Damietta not to forsake her, by liberally supplying them, from her own private purse, with all necessaries; and the city, as has been said, was soon found to be quite impregnable to all assaults of the enemy.

On the morning of Ascension-day the treaty was carried into execution; and at sun-rise the Crescent had supplanted the Cross upon the walls and towers of Damietta. Some noble knights, as Sir Geoffrey of Sergines, (who in one battle had beat off the Saracens from his sovereign's person, as the king said, like so many flies;) the Marshal of France; the Count of Poitiers, the king's brother; and his seneschal, Joinville, were retained till the gold had been paid down. This task occupied many hours, for the whole sum was weighed; and, when afterwards the Saracens complained that there was a considerable sum short, the king took their word for it, rather than risk the slightest non-performance of his promise, although he was thereby put to much temporary inconvenience, and compelled to obtain the money from the Knights Templars. The infidels were not equally scrupulous, and violated their pledges in three points of importance; for they slew the sick in the city, and, when reproved, and reminded of the very different conduct of Saladin under similar circumstances, attempted to justify the act on the plea that these could not recover; they likewise broke to pieces the engines of war, and made an immense bonfire, which lasted three days, of the dead bodies and all the bacon they could find. It is right, however, to mention that some noble Saracens (one called Faracataie is especially noticed) were much grieved at their countrymen's ill faith, and did all in their power to remedy it.

At length the king and queen, with the two royal counts, and 6,000 men (about one-eighth of the original number,) embarked in Genoese galleys, and were transported to Acre, in Syria. During the passage the king and his seneschal mutually related what had occurred to each during a period in which they had been separated; and Louis, though still deeply lamenting his brother's death, impressed upon Joinville the great reason that each had to be thankful for preservation amid so many dangers. They were received at Acre with great joy: but a question soon arose as to the propriety of the king's immediate return to France. Most of his counsellors recommended it strongly; but Louis had such confidence in the wisdom of the queen-mother, Blanche, and was so anxious to serve the cause of Christianity in Syria by all means in his power, that he resolved to remain there for some time.

Biography will cease to be useful if narrators are predetermined to applaud every action of their hero. To us, the conduct of Louis on this point appears mistaken; putting aside the question of the war, surely no scene,

¹ This was on a machine composed of planks of wood, united by strong leather bands, between which the legs of the unhappy sufferer were crushed, till not a bone remained entire; and after three days, when the legs were swelled, it was applied again.

² Probably a penitential observance on the part of those who had greatly violated the laws of Mahomet.

when that was once concluded, could be so fitted for the exercise of his wise and virtuous administration as his own kingdom. He entered, however, into the affairs of these countries with such zeal, as to cause an apparent neglect of his wife and children for a season, conduct most contrary to the warm affection, and care which, at all other times, both before and after, he displayed. But it is, of course, with much diffidence that we should arraign the proceedings of a man whom we must feel to have been so much above any ordinary standard of goodness. Certain rules, indeed, there are of right and wrong which we need not be afraid of applying to the conduct of the best of mere men; but in all doubtful cases there is much hardihood, as is remarked by a French historian,¹ in condemning saintly men; we ought to be what they have been, to judge of what they have done.

Embassies came, as before, to do honour to the king: one, strangely enough, from the leader of a band of assassins, famous in those days, called the Old Man of the mountain. He sent to Louis his own shirt, esteemed a symbol of affection, a ring of very fine gold, an elephant, and an *orafe* (most probably a giraffe), formed of crystal. Ladies who use scented note-paper will perhaps be surprised to learn (considering the age and country) that the letters accompanying these gifts filled the room with perfume when opened.

But the death of Queen Blanche, who for some time past had not shown her former address and equity in government, changed the face of affairs. The king was much afflicted; but Margaret, though sorry, for her husband's sake, could hardly mourn deeply over the loss of one who had proved to herself a harsh mother-in-law. Preparations for return were now made, but not before Louis had placed all garrisons in those parts in a proper state of defence, and distributed his money so freely, as to obtain the title of "*Father of the Christians*" in the East.

A fleet of fourteen sail now bore back to France her monarch; the vessels touched at Cyprus; and, after weathering a dangerous storm, restored him, in July, 1252, to his native home.

Henceforth we must, for the most part, view Louis as a sovereign and legislator. We regret that space does not permit us to treat of his performance of these functions so fully as we could desire, but trust to give some idea of at least the principles on which he acted. Two subjects claim the especial attention of students of history; firstly, the power and position of the crown in the thirteenth century; secondly, the state of feudal law. The former of these has already, in some degree, been discussed in the earlier part of this narrative; we must now return to it. Dissensions were constantly arising among the barons, and it had been deemed good policy by his predecessors to foment those quarrels; in common parlance, to play off the great vassals one against another, and thus to aggrandise his own weight. Louis invariably exerted himself to reconcile them. But his benevolence, as is justly observed by Hallam, had all the effects of far-sighted policy. The justice of his decisions was so evident, that appeal to him became the constant practice: but such reference almost implies the superiority of him to whom the appeal is made; and thus the supremacy of the sovereign became universally, though imperceptibly, acknowledged. What marvel that such a ruler raised the influence of the monarchy to a far higher point than the most ambitious of those whom he succeeded on the throne! His love of integrity did not rest satisfied with awarding just judgment to others; he attended to all claims upon the crown which could be preferred by his vassals, and gave all doubtful cases against himself; yet further, he appointed commissioners to inquire what possessions had been unjustly

annexed to the royal territory during the reigns of his immediate predecessors, and restored all to the families of the original proprietors, or, if these could not be discovered, distributed the value of the estates among the poor.

At a parliament held soon after his return from Syria, Tybalt, king of Navarre (son of the Tybalt mentioned in the earlier period of the reign) demanded King Louis's daughter, Isabel, in marriage. The king, however, who knew that a dispute was pending between Tybalt and the court of Brittany, would not permit an event which might give undue influence to one side, to take place at such a time, saying that he would not marry his children to the prejudice of his barons. On the dissension being amicably settled, he willingly consented to the match, and the nuptials were shortly afterwards solemnized with much splendour at Melun.

About this time, Henry III. of England (who had recently referred to Louis's arbitration the great questions at stake between himself and his barons) visited France. Louis, to the surprise of those around him, had restored many places which had been won by conquest from the English, and declared, in answer to the remonstrance of his barons, "I am satisfied that the land is fairly mine, but give it up to cherish the love that ought to exist between my children and his, who are cousins german."

On this occasion, the Countess of Provence had the satisfaction of meeting her four daughters. Assuredly she had ample reason to be satisfied with her success in match-making: two of her children had married kings, (Louis, and Henry of England,) and two became great countesses, by wedding king's brothers, (the Counts of Anjou and Cornwall,) and of these last, one subsequently became Queen of the two Sicilies, when Charles of Anjou obtained that kingdom. Henry of England was quite won by the kindness and attention which was shown him by his brother monarch, and returned home filled with good-will towards him.

We have thought it best to narrate these events before entering on the subject of the legislation of King Louis. The code of feudal customs which he compiled, was the first monument of legislation reared by the ancient House of Capet, and continued to the era of the Revolution to be, in the main, the law of the land. Amidst the turbulence and lawlessness of the times, such a body of laws must have been grievously wanted, and felt as a great blessing when promulgated. "There is," says Hallam, "a peculiar beauty in the reign of St. Louis, because it shows the inestimable benefit which a virtuous king may confer upon his country, without possessing any distinguished genius." Genius is, indeed, the prerogative of few; but we cannot but think that the abilities of Louis are somewhat underrated by this writer. Independently of his military talent, which was considerable, we may appeal to his institutions, as displaying large views of that policy by which kingdoms should at all times be governed, combined with much insight into the particular circumstances of his own age. Certainly he possessed, in an eminent degree, that clearness of vision, which commonly attends purity of heart and singleness of purpose; "he would see through a thing at once," says his biographer, "and appeared the wisest of his council." This must also be taken into account in estimating his intellectual powers, that we hear of no prime minister,—no Sully or Cecil at his right hand, to be the main-spring of his actions, and a constant referee in difficulties; he always, indeed, conferred with others, but appears, like our English Alfred, to have been, under Providence, the real source of his own greatness. The state of feudal law was very sad, and by no means uniform; each barony having its peculiar customs and privileges. Accordingly, uniformity is one great object of his code of laws; although the great power which some peers still retained, prevented the entire, or immediate accomplishment of this end. Men accused of any crime used constantly to recri-

¹ Velly. The neatness of the original tempts us to quote it:—"Il y a beaucoup de témérité à condamner certaines actions des saintes; il faut être ce qu'ils ont été, pour bien juger de ce qu'ils ont fait."

minate, like Norfolk and Bolingbroke in Shakspeare's Richard II. In such case, both were imprisoned, and, in default of proofs, had to proceed to trial of wager. Against these judicial combats, and against every species of duelling, Louis bent all his influence, with great success in his own especial domains, but far less efficiently where the different barons most prevailed: for duels were lucrative to the liege lord, since the horse and armour of the vanquished became his, and, in some cases, all the property: and a loss, which the Kingsuffered gladly, so that he might abolish those unjust ordeals, arrayed the selfishness of the less upright against the change. Capital punishment was reserved almost entirely for prisoners guilty of assassination, homicide, rape, highway-robbery, incendiarism, and treason, a most merciful catalogue if compared with many of a later date in other European countries. Prisoners were to make their own defence, excepting noblemen, clergy, and women, who are allowed to plead by proxy. The gentler sex is, throughout the code, treated with the courtesy and forbearance which the chivalrous spirit of its author would naturally prompt. A noble lady wedded to a commoner transmitted her nobility to her children; though they could not, without special grant, receive the honour of knighthood. Appeal from inferior courts might be made to the Sovereign, but his decision was, of course, final, as he owned no earthly superior. Noblemen might not leave more than one-third of their property to their younger children, for fear of impoverishing the heir. The coinage was revised and greatly improved. Every thing connected with the internal tranquillity of families occupied much of the King's attention, and the subjects of donations, dowries, guardianships, &c. are treated with equal sagacity and justice. Libels are fined lightly; except in the case of a false attack upon female character, when the sum paid both to court and plaintiff was very greatly magnified. With these few specimens of this celebrated code, we quit the topic of the laws.¹

Meanwhile in all minor transactions, and the affairs of daily life, (perhaps after all the severest test of true principle,) by precept and example, as well as by just rule and judgment, the saintly king was consulting the best interests of his family and subjects. His dress was grave and simple: his diet plain: his conversation chastened, though cheerful. At eventide he would tell his children tales, now of good kings and emperors for imitation, now of bad rulers who through luxury and injustice had lost their kingdoms; and frequently made them perform their devotions in his presence. To the poor he was exceedingly bountiful, and daily fed numbers, serving them himself in person. He augmented the value of small benefices after previous consultation of good clergy, and invariably sought out the ministers of any town whither business called him, and requested their prayers for a blessing on his labours, adding withal, a donation for alms. For women who were widows, or lying in, or those who through poverty might be tempted to a sinful course of life, he founded hospitals and religious houses, and "with these," writes his seneschal, "illuminated his realm, as an author his books with gold and azure."² Yet, with all his benevolence, he never forgot that he was a king, but received his parliaments and assemblies of barons right royally, with greater state and hospitality than for some generations had been displayed at the French court. His second son Philip was united to the young Princess of Arragon, who had been destined to the elder brother Louis; but the untimely death of the latter prevented the consummation of the match; he likewise married many younger members of his large family, (consisting of six sons and five daughters,) and provided for them without prejudice to the

crown, the domains of which he increased by purchasing lordships where the owners were the last of their families. Rebellion now became a thing unheard of. The integrity of the king's administration afforded no pretext for it, and his courage and firmness, without which all other merits had in such times proved ineffectual, were so well known that the peers felt that all concessions arose from no coward fear, but solely from his sense of duty and princely magnanimity of heart.

Yet, strange to many as it may appear, the hope of seeing Palestine rescued from the sway of the unbelievers had never left Louis throughout the period of twenty years which had elapsed since his return from Syria. To the surprise of all, to the terror of most, he summoned a Parliament and proposed a fresh crusade. Respect and affection for their sovereign overcame the reluctance of many lords who were personally opposed to the expedition; but Joinville, with all his love for Louis, refused to go, and on grounds which appear but too just.³ Nay, he thought that those who counselled the king in this matter sinned mortally; for Louis "was now so feeble that he could not ride, yet, had he remained, he might have lived to do much good; whereas at his departure everything began to deteriorate. But the subject lay too near his heart, and in the year of our Lord 1268 he set sail for Tunis, yet not before he had secured the liberties of the Gallican Church against the Papal encroachments, by a famous treaty termed the *Pragmatic Sanction*, an edict worthy of all notice on the part of those who take interest in Ecclesiastical History, when they consider the character, and devotedness to the Church, of him who formed it.

He was induced to steer for Tunis which did not lie in his course, by a report that the king of that district desired to become a christian. Although the tide of enthusiasm for the Crusades was fast ebbing, yet such had been the force of Louis's example, that not only many French nobles, and Gaston, Viscount of Bearn, and Charles of Anjou, now King of Sicily accompanied him; but likewise many Scottish, Castilian, and Catalan knights; Prince Edward of England, and his brother Edmund, Earl of Gloucester. But the rumour proved entirely false. After capturing the town of Carthage, the army was compelled to lay siege to Tunis, but disease attacked the host, and its leader was seized with an intestine malady.

Then the holy king felt his end approaching, and summoned his son Philip, to whom he gave his blessing, with advice, of which our limits will not permit us to say more, than that its maxims of policy were worthy of the sagacity, and its spirit of the piety of the speaker. He then received the sacrament, and showed that he still retained sense by making the responses throughout the penitential Psalms; and, bidding his attendants recline him on a couch strewn with ashes to express the depth of his contrition, crossed his arms, and, looking heavenward, rendered his spirit to his Maker at the same hour on which his Lord had expired on the cross, on the day after the feast of St. Bartholomew, A. D. 1270.

His remains were taken home and interred in the Abbey of St Denys. He was shortly after canonized by the Church.⁴

Thus lived, thus died, the sovereign whose fortunes we have attempted to narrate. The quaint old chronicler, to whom such frequent reference has been made, declares that he undertook his master's biography with three

¹ Any reader who may chance to take interest in such a subject, is referred to Velly, *Histoire de France* (tom. iii.), for further information.

² A comparison peculiarly appreciated in the thirteenth century, when illuminated manuscripts were very general.

³ These were the grievous impoverishment of his own vassals, their mal-treatment by subordinate officers of the crown, and the great injury which the kingdom then flourishing in peace and justice would, (and did,) sustain from the king's absence.

⁴ It might be thought dishonest to omit all allusion to two points, unfit for further notice here. 1. That Louis, in accordance with the teaching of his age and country, practised invocation of saints. 2. That his countrymen claimed for his tomb some miracles; but Joinville, though he asserts as much, does not mention *any one instance*.

main objects in view: first, that he might record the excellence of his kingly government, which was ever according to the law of God and his Church; secondly, that he might display his feats of arms and chivalry; lastly, that he might set forth his true saintliness of heart, which was such as perhaps no layman of his time attained unto. Much as we have been compelled to omit, yet unless we have given some idea of these we have failed egregiously. As a pattern of chivalry, Louis probably stands unrivalled; in these days we need not seek a revival of its form. Sword and lance and Eglinton mock-tournaments are not required; these are after all the accidents and not the essence of the chivalrous spirit, but its loyal and loving temper towards God and man, its courage and its gentleness, its union of true courtesy and hardihood, its affection and abnegation of self: these are its true characteristics, and these are of all time.

The reader of later French annals will from time to time encounter the name of Louis the Ninth, "breathing like a gale from happy spots,"¹ and fraught with all pure and ennobling reminiscences. His descendant Louis XIII. obtained that his day should be observed as a general feast. When Henrietta Maria was about to wed our Charles the First, her mother in writing to her, bids her remember that she is a descendant of St. Louis.² When the satanic outburst of wickedness which attended the French Revolution reached its consummation in the execution of a sovereign, (Louis XVI.) who had never in word or deed wronged his people, the Abbé Edgeworth who attended him, said, almost as the axe descended, "*Son of St. Louis, ascend to heaven,*" (*Fils de St. Louis, montez au ciel.*) "These," says Professor Smyth, "were the last words that reached the king's ear, and none other were worthy to follow them. They had burst, as it afterwards appeared, unconsciously from the holy man in the agony of affliction, and they poured visions of glory into that vale of death which he was now every moment entering."³

Even now, amidst the attractive gaities of the French capital, amidst the signs of anarchy and infidelity, his memory may occasionally be brought even to the mind of a stranger. In that edifice (the Chapelle de St. Ferdinand) which commemorates the death of the hapless Duke of Orleans, and forms at once the most honourable and affecting tribute to his worth, and to the piety and affection of his parents and dearest relatives,—the windows bear the images of kingly saints, as if to remind the royal family that the temptations incident to their station need not necessarily prove a hindrance to growth in goodness. Among these, St. Louis holds his fitting place. The visitor at Versailles will now find that sumptuous palace adorned with painted and sculptured records of the nation's history, and dedicated "*aux gloires de la France.*" If, wearied by the repetition of ambitious wars, or revolutionary excesses, he should sigh for recollections of a truer patriotism and wisdom, the history of France is assuredly not that which will deny it him. He will turn, perhaps, to that gallery where the memory of the Maid of Arc has received a visible embodiment and well-nigh breathing form from the hands of Mary of Wurtemberg, and then descend to that gorgeous chamber, where, amidst the heroes of an age whose influence can never wholly cease, with Godfrey de Bouillon, with St. Bernard, with Richard of England the Lion-hearted, stands the pictured effigy of one, who was a worthy successor (as a leader of crusades) to the first, and who combined in his own heart the devotion and valour of the other two, mounted on his charger you behold him, the ancient fleur-de-lys conspicuous on his azure robe, *Louis the Ninth—Saint Louis of France*, "the noblest and holiest of monarchs."

Reading for the Young.

THE CEDAR OF LEBANON.

I AM going to give the history of what was, perhaps, the first Cedar of Lebanon brought over to Europe.

It grew in the *Jardin des Plantes*, in Paris, and was such a loved and favourite tree, that people liked to repeat the story of its first being planted, the adventures it had gone through, and the changes it had seen; and these I am now going to tell you.

A Frenchman was travelling in the Holy Land, and found a little seedling among the Cedars of Lebanon, which he longed to bring away as a memorial of his travels. He took it up tenderly, with all the earth about its little roots, and, for want of a better flower-pot, planted it carefully in his hat, and there he kept it and tended it. The voyage home was rough and tempestuous, and so much longer than usual, that the supply of fresh water in the ship fell short, and they were obliged to measure it out most carefully to each person. The captain was allowed two glasses a day, the sailors, who had the work of the ship on their hands, one glass each, and the poor passengers but half a glass. In such a scarcity you may suppose the little cedar had no allowance at all. But our friend the traveller felt for it as his child, and each day shared with it his small half-glass of precious water; and so it was, that when the vessel arrived at the port, the traveller had drunk so little water that he was almost dying, and the young cedar so much, that, behold, it was a noble and fresh little tree, six inches high!

At the custom house, the officers, who are always suspicious of smuggling, wished to empty the hat, for they would not believe but that something more valuable in their eyes lay hid beneath the moist mould. They thought of lace, or of diamonds, and began to thrust their fingers into the soil. But our poor traveller implored them so earnestly to spare his tree, and talked to them so eloquently of all that we read in the Bible of the Cedars of Lebanon, telling them of David's house and Solomon's temple, that the men's hearts were softened, and they suffered the young cedar to remain undisturbed in its strange dwelling.

From thence it was carried to Paris, and planted

most carefully in the *Jardin des Plantes*. A large tile was set up against it as a protection and a shade, and its name was written in Latin and stuck in front, to tell all the world that it was something new and precious. The soil was good, and the tree grew; grew till it no longer needed the shelter of the tile, nor the dignified protection of the Latin inscription; grew till it was taller than its kind protector the traveller; grew till it could give shelter to a nurse and her child, tired of walking about in the pleasant gardens, and glad of the coolness of the thick dark branches. Soon these branches spread so far on every side, that other nurses and other children could assemble under the shade, and play their little games together.

The cedar grew larger and larger, and became the noblest tree there. All the birds of the garden could have assembled in its branches. All the lions and tigers, and apes and bears, and panthers and elephants, of the great menagerie close at hand, could have lain at ease under its shade. It became the tree of all the trees in the wide garden that the people loved the best; there, each Thursday, when the gardens were open to all the city, the blind people, from their asylum, used to ask to be brought under the cedar; there they would stand together, and measure its great trunk, and guess how large and wide must be its branches. It was a pleasure to see them listening to the sweet song of the birds over head, and breathing in its fragrant eastern perfume. They thought of the distant East,—the East, from whence comes the true light, their *only* light; they could never hope to see it with their mortal eyes, but here the East seemed to visit them, and they could touch it.

The blind seemed to call the dumb there: for the deaf and dumb too chose the cedar for their friend. The blind dreamed that they could see the cedar when they heard the murmur of its branches; the deaf thought that they heard the song of the birds as they saw them fly from branch to branch.

Not only on Thursday were the blind and the deaf and dumb to be seen there, but the poor foundlings, those desolate children whose fathers and mothers have deserted them, and who are abandoned to the charity of strangers, found it their greatest treat to collect under the cedar, and dance round it; or, perhaps, with sadder thoughts, they would sit to rest and watch the happier children passing, with fathers and mothers and sisters by their side, all talking and laughing together. To these poor children the cedar was a kind of Father; year by year they measured their growth by it; at their earliest recollection they were not higher than this little projection of rough bark; now they can almost touch the lowest sweeping branch, when the wind waves it downwards.

There was once a prison at the end of these gardens, a dark, and dismal, and terrible place, where the unfortunate and the guilty were all mixed together in one wretched confusion. The building was a lofty one, divided into many stories, and, by the time you reached the top, you were exhausted and breathless. The cells were as dreary and comfortless there as in the more accessible ones below; and yet those who could procure a little money by any means, gladly paid it to be allowed to rent one of those topmost cells. What was it that made them value this weary height? It was, that, beyond that forest of chimneys and desert plain of slates, they could see the Cedar of Lebanon! His cheeks

pressed against the rusty bars, the poor debtor would pass hours looking upon the cedar. It was the prisoner's garden, and he would console himself in the weariness of a long, rainy, sunless day, in thinking, the cedar will look greener to-morrow. Every friend and visitor was shown the cedar, and each felt it a comfort in the midst of so much wretchedness to see it. They were as proud of the cedar in this prison,¹ as if they had planted it.

Who will not grieve for the fate of the Cedar of Lebanon? It had grown and flourished for a hundred years, for cedars do not need centuries, like the oak, to attain their highest growth, when, just as its hundredth year was attained, the noble, the beautiful tree was cut down to make room for a railway. This was done just ten years ago; and now the hissing steam-engine passes over its withered roots. Such things, it seems, must be; and we must not too much grieve, or complain at any of the changes that pass around us in this world of changes, and yet we cannot but feel sorry for the Cedar of Lebanon.

SKETCHES AMONG THE ALPS.

No. II.—SUNRISE AND SUNSET FROM THE RIGHT.

WE were now in one of the small catholic cantons, the little hemmed-in valley was quiet as the absence of steam and manufactures could make it, yet it was most fertile, and its circumscribed lake deep enough to have nourished fish for the inhabitants for every day of the year; but some tough exertions had been made to produce greater substantialities, which probably were consumed six days out of the seven, when they could be had.

This canton abounded with Capuchins, male and female. It is amazing how they, and their habiliments and dwellings assort with the land that harbours them; perched on the summit of a rock, or squat beside the borders of a Swiss lake, a square box English rectory would be unendurable; we must be persuaded, whether we will or not, that discomfort and the picturesque go hand in hand. One of the strange conceits of their religion was shewn here in a collection of hundreds of human skulls, though, in being labelled with the departed owners' names wanting the poetical mystery attached to the more northern eccentricity of the same kind; but thereby giving rise to no such heretical doubts of authenticity; the testimony thus afforded by the dry bones appeared to be at least as valuable as the inscriptions of tombstones, or of the temporary gilt crosses first erected in memory of the sleeper.

There was the overhanging roof, the open gallery, and the carved wood-work, in all their chaste and simple taste; a female carried a heavy billet of wood, casting it on a pile of such faggots beside her abode, her winter's supply of fuel; her face was a homely one, as the phrase goes, and like her's are the majority of her countrywomen's; the sex work hard here, but she had neither the distorted form, nor diseased complexion, so frequently caused by want of all work; she was neither the weak nor ugly being of indolence. Many wise people now-a-days inveigh against out-door labour for females, would have them draw out other duties to attenuation instead of it, and would rather that vapours should exist, than a complexion of bronze, highly cherishing the poetical

¹ St. Pelagie.

idea of feminine fragility. This poor Swiss peasant who excited our admiration, was very robust; her feet, we need not add, were scarcely after the Chinese model; she raised an arm rather unlike that of "the finer statue than nature ever made;" and, though she might not exactly have bewildered a man's judgment, yet the intelligence of her countenance spoke more for the owner, than could have been done by the tamer expression of a smoother face.

Mountains had fallen here, and others threatened to fall; yet hamlets were fearlessly placed, where the slippery material overhanging them seemed bent on their destruction. Full of faith, surely, must be the founders of such dwellings, trusting ever for the best. As darkness once more deepened, the intense heat of day decreased, summer-lightnings began to flash in magnificent sheets across the lake, mocking, with a transient but most vivid glare, the tiny artificial lights that now appeared in the windows of the few habitations surrounding its near termination. Wandering among the repositories of the dead, we marked the distinction between the monumental inscriptions and those of our own country. Here the departed was attested to be the husband of the wife whose name was added: whereas with us no mention is made of the latter whatever. From the pulpit in the Capuchin church, a naked arm and cross were thrust, whose bareness, seen even in the twilight, reminded us of the giant killer, or queller (as Captain Clutterbuck will have it), whose legs and arms, hands and feet, did duty of their own accord, unaided by the rest of the body. In certain situations, poverty and ignorance thwart the good taste of the Church, as she is obliged to cater to a variety of palates; for, since all her children are not judges of the fine arts, and holy writ counselled "to throw no pearls away," the bedizened and bespangled Madonnas, like this bald arm, make an impression where that divinity of art which enchants the world would unquestionably fail.

Without doors once again,—and the huge dark mountains had become gloomy to sublimity. On three sides rose the cloven Mythen, the Righi, and the riven Rosenberg, with many others, all becoming more shadowy and vast as the obscurity deepened: grand and majestic they were, yet not fearful, for the night was still and clear.

In the roar of the tempest, with the thunder echoing around, the cataracts rushing from their sides, or amid the wild drifting of the snow-storm, how differently would they impress the mind! Even now, as the sun sank, and a few heavy clouds gathered for a while about them, there was a token given of what the war of the elements would be in this the region of their home.

During the night the wind rose, and rain fell in torrents; a drenched watchman loudly sung the hours, but he seemed out of place, this guardian of the night, in a place so simple and so still. Next morning, Sunday, mass was to be performed, and the way to the church was thronged: females passed with long plaited hair, dressed chiefly in black; one white cap was surmounted with frills from back to front, like two large cock's combs; as usual, the attire of the women was more varied than that of the other sex, the latter merely vying with each other in the largeness of their shoe-buckles.

An ugly species of rock (if nature made anything ugly) is the pudding-stone; even its largest masses require distance to produce effect. We are told that

when, years since, its huge bulk slid down here, an old man continued to light his pipe. Smoking must have been to him as opium to the Turks, sufficient to make him a fatalist. Fallen mounds lay around us, and hurled down fragments, on which, however, time had done its work, causing renewal from ruin; the rent face of the torn rock is losing its traces of desolation, but slowly and with hesitation, as if fearful of another overthrow. The works of man were soon hid from us by distance: half way up the mountain which we had now begun to ascend, they could not be seen. In the gully all prospect was lost, but there were other diversions instead; the tree-steps were leg-breaking, at first sight, although as we were convinced afterwards, vastly safe and commodious, compared with other Swiss staircases. We next met pilgrims, many of whom had travelled from a distance during the night. The straw hats of the women were as large as the broad-brimmed head coverings of the pilgrims of old. The indulgence had been extended beyond the usual time; whether the attendance had at first been scanty, and the period prolonged, in the hope of its being better, or whether it had been so good, that it was continued in order to make the most of it, we were in the dark.

The early devotees passed on praying, their eyes however directed exclusively neither to their heads nor the path: it would appear they were accustomed to pray, and yet not to stumble on a rough road, and withal, would take a glance at what was passing around them. The miserable effigies on paper at the stations could scarcely incite to devotion; the more of it therefore, to their credit, must have been in the hearts of the worshippers.

On one of the wildest parts of the mountain enormous blocks were strewn around, and, for a time, hill and sky were alone apparent. Arrived at what might be called "the half-way house," there were incongruities exhibited in the shape of public houses confronting the very shrine, whose hostesses and inmates seemed for the hour at best little awed by the sanctity of the neighbourhood; the fathers too were at their dinners, as well as their penitents.

The pasturages appeared; the tinkling bells of the flocks and herds were heard a little higher up, and mountains were fast disappearing into levelness with plains, the hues of the far landscape opening to the sight upon one side were less pleasing than from below; distance, and the ascending sun had confused them. Higher still and we stood as on an immense pole stretching enormously upwards from the depth underneath. We entered the convent-like house of entertainment, and the reflection occurred to us whether it would be more endurable to be the keeper of a light house on a solitary rock in the ocean, or that of such an edifice as this when the snows of winter were piled high around it, and had chased away all other inhabitants. We gave the preference to the latter, as well as to the vocation of hermit, if such troglodytes are yet to be found. Sunset was approaching, the glorious scene we had come to witness; clouds still wreathed the middle of the nearest mountains, and the light of the planet of day was yet on their summits. One portion of the grandest lake in Switzerland lay below its surface, showing like clouds seen through other clouds, a complete deception to the sight. Among the groups who stood anxiously awaiting the crisis of splendour, there was one of peculiar effect, consisting of a black-gowned priest, two brown robed capuchins, and four short-skirted female peasants, all in company; the dark scull-caps of the monks covered heads the antipodes of each other, respective representations of intelligence and stupidity. After gazing around them for a while, the friars ran down the declivity, managing their long habits with feminine dexterity, and disappeared to reascend next morning.

It was now sunset, and from the Righi hundreds of Alpine peaks bristled far and wide on either hand;

glaciers shone in the most effulgent light, while the thinnest of clouds hovered over them. In the magnificent centre three spiral pinnaced mountains shot up into the very heavens, as if thrones waiting for Archangels to light upon. Soon a transparent and purple mist of the most beautiful tinge floated on all below. One cloud after another took farewell of the huge masses till only a few remained, as if likewise to assert their claim to the admiration of a world. On the other side the outstretched heights of the Jura and Schwarzwald rose in majesty, while the lakelets had become as drops of water, and the rivers as lines. The reign of day was past, night slowly approached to begin hers; the prevailing colour of the sky changed to a clear deep blue, and the purple mist on the low grounds darkened to lead; the sublime masses of the shining worlds of snow seemed to become colder and more cold until the iciness of the pole might have been imagined present. As the vast curtain of night spread and darkened, the air became chill in the extreme; the scene was one of awe; the bleak and mighty wall of rock and ice advanced in fancy nearer, the distance between it and us seeming each moment fearfully to diminish; its final approach to annihilate and sweep away appeared inevitable. It was a strange effect; but just as the tremendous barriers darkened and deepened to the semblance of black marble, they began to fade in distinctness, threatening to dissolve in air; the last remains of light left each summit, yet the shadowy and solemn array was fixed on the vision still, as a supernatural embattlement for the night, which no human power could force.

And the sun rose again; but long before his approach a herald came, lest his sudden glory should bewilder: a warning stream of light, inferior in brilliance only to the fountain from whence it flowed, changed next with a warm grey tinge; it dispersed itself over the many miles of landscape around, the avant courier of a more splendid illumination. Then slowly arose the monarch, to light up more than two hundred summits, first and most powerfully beaming on the pinnacles at hand, while he left the more distant yet obscured in the mist of morning. It was a dazzling sight, that of the vivid shining rays, in their clear, warm, and fresh splendour, of which a transient reflection was given on some of the snowy heights, an evanescent glance on the superb elevations; how like a creator seemed the orb of day to these cliffy altitudes, thus withdrawn from night and chaos, and made to welcome his presence, each one a wonder for an universe to look upon! His dominion for the day established, and his power acknowledged, he reposed for a while, a sober hue overspread the scene, mist followed to diversify, and then clouds gathered around to veil the sun of morning, and to usher in that of noon.

The sight of the lofty solitudes, however, was to be abandoned for a time; forests, rivers, and the dwellings of men succeeded them; wreaths of mist floated in the air; the shadows of the dawn had dispersed as the day advanced, and all was blest with light; the dark Pilatus frowned away approach, while the most perfect lake in Europe invited it. Mont Scnlis, with its snowy peak, towered far behind and above the ruinous Rossberg; no spectre of the Righi had confronted us, but he was easily conjured up amidst a scene where the duller imagination could not be inactive, where man might have fancied himself in a shadowy world, demon, or angel, as the mood inclined. A hardy little cow stood on the verge of a precipice, with all the indifference of a chamois; apparently, either enjoying the view, or meditating suicide; exalted by her commanding and dangerous position, while her sight of the grandeur beneath must have been perfect, provided her nerves were firm;—apoplectic she could not be, for certain, or she had at once toppled down from her giddy eminence.

In our descent, the sight was again deceived by a part of the mountain jutting into the lake, making it appear

the islet it was not. The steamer approached, spattering and hissing, guides and porters shouted and struggled, all in disharmony with the scenery. Beyond lay a native Lucerne boat, no smoky funnel had it, no noisy paddles, and no crowd of passengers. The old boatmen have a grudge at the fiery intruders, and so had we, despite their power against squalls and time. The high, abrupt, and rugged promontories seemed formed for storms to play around. To the dwellings far up on the mountain sides, the road was as if lost; a short way on, and the precipitous rocks descended sheer to the water's edge, giving no resting place for human foot. Man would have been as an intruder where earth and water thus met! Towards the upper portion of the lake, parts of the rocky strata seemed as if it had boiled up from below; the high mountains shut out the world beyond, defying the spectator to look on aught save them, while in their presence; in contrast, some were crowned with snow, others with trees.

But to see this lake in perfection it should be beheld when beset with clouds and tempest, beneath a sky in keeping with its savage wildness; though, whether in sunshine or in storm, of itself it leaves nothing to be desired. We landed to pursue our way through marshes, towards poverty, disease, and some of the finest scenery in Europe. A fat Swiss and his equally heavy lady, sat down to dinner beside us; the good woman, whose round face surmounted a throat encased in a black stock, seemed to be absorbed by the magnitude of the outlay she was compelled to make, reflecting probably on how she could best dispense with the numerous helps who had thrust themselves forward for her accommodation and their own interest; but if such were the subject of the lady's cogitations, it might be surmised from the blank expression of her eyes, that she felt rather perplexed and puzzled how she was to effect her object, since she could neither fly nor swim, and evidently would not be content with a meal gathered from the wayside.

This place of rest was shut in on three sides by high mountains, a noxious effluvia pervaded it, drains, though highly necessary, were wanting. The abode of the monks rose conspicuous above all; they occupied the best situation, Goitres and Cretins abounded; if the Goitred women suffered no pain, the deformity, nevertheless, distorted their features to something very like the expression of it; and the miserable beings were so tattered in their dress it seemed no wonder that beggary was abroad and asking.

Swiss architecture, in a few instances, began to give place to that of Italy, wood was less used in the dwellings, the galleries were missed, and the overhanging roofs; it was the memorial spot of Tell, yet his monument was rivalled by that of a Capuchin.

POPULAR YEAR-BOOK.

April 12.—Easter Day, (1846.)

"THIS is a movable festival in commemoration of the Resurrection, and being," says Brady, "the most important and most ancient in observance, governs the whole of the other movable feasts throughout the year." Whether Easter was first kept by the Apostles or by their immediate successors, about A.D. 68, cannot, perhaps, be satisfactorily proved. The period of its celebration has been various in different countries. In 314, the Council of Arles decreed that all the churches throughout the world should celebrate the Pascha of the Resurrection, on the Sunday after the fourteenth day of the March moon; and the Council of Nice in 325 confirmed that ordinance. The Anglican Prayer-book contains the following rule:—"Easter Day is always the first Sunday after the full moon, which happens upon, or next after, the twenty-first day of March; and if the full moon happen upon a Sunday, Easter Day is the Sunday after."

In the Greek and Latin churches, this festival is styled *PASCHA*, a word derived from the Hebrew name (signifying a passage) which was given by the Jews to their great feast of the Passover. In Yorkshire it is still called *Peace*, which is plainly a corruption from the above designation. The name *Easter* may have been derived from *Eastre*, a Saxon goddess who was worshipped at this season: or from the Saxon *Oster*, to rise, in allusion to CHRIST'S Resurrection. Easter Sunday was anciently called the Great day, and the Feast of feasts; and in some places, God's Sunday.

OLD AND POPULAR CUSTOMS.

It was once a general belief that on Easter morning the sun danced or played immediately after his rising: and the common people went very early into the fields to witness this phenomenon. Sir Thomas Browne, in his "Vulgar Errors," remarks:—"We shall not, I hope, disparage the resurrection of our REDEEMER if we say the sun doth not dance on Easter Day." In some localities it was thought requisite to visit the brink of a fountain, and observe the reflection of the sun upon its surface. "I have heard of, when a boy," writes Brand, "an ingenious method of making an artificial sun dance on Easter Sunday. A vessel full of water was set out in the open air, in which the reflected sun seemed to dance, from the tremulous motion of the water."

At this festival it was also customary to remove the soot and ashes from the fire-places, and burn them, with much ceremony, in the court-yard. A Homily of the time of Henry VI. says:—"This day they do the fire out of the hall; and the hearthstone that hath been in winter brown and black with the smoke, shall this day be arrayed in green rushes, and strewn with flowers all about, showing to men and women that right as they make clean their houses, right so shall ye cleanse the home of your soul, and do away deadly wrath and envy, and strew the herbs and flowers of virtue and goodness."

We learn from Lyson's "Environs of London," vol. iii. p. 603, that there was an ancient custom at Twickenham, of dividing two great cakes in the church upon Easter Day among the youths and maidens, but, this being considered by the Puritans "a relic of popery," it was ordered by Parliament in 1645, that the parishioners should "forbear" the usage, and "instead thereof," buy loaves of bread for the poor of the parish with the money that should have purchased the cakes. It appears that 1*l.* per annum is still charged upon the vicarage for the purpose of buying penny-loaves for poor children on the Thursday after Easter. Within the memory of man they were thrown from the church steeple for; a usage which also formerly prevailed at Paddington. Hasted, in his History of Kent, speaking of Biddenden, in that county, observes "that twenty acres of land called the Bread and Cheese land, lying in five pieces, were given by persons unknown; the yearly rents to be distributed among the poor of this parish." This is yearly done on Easter Sunday, after Divine Service, in the afternoon. About a thousand cakes, (each of which have the figures of two women united at the hips and shoulders, stamped upon it,) are given to all such as attend the church, and about three hundred quarter loaves, and cheese in proportion, are distributed to the parishioners only, at the same time. There is a tradition that the figures on the cakes represent the donors of this gift, being two sisters, who were joined together in their bodies and lived in that state thirty-four years: but "the truth seems to be," says Hasted, "that it was the gift of two maidens, of the name of Preston, and that the print of the women on the cakes has taken place only within these fifty years, and was made to represent two poor widows, as the general objects of charitable benefaction." The writer has one of these cakes in his possession. Its appearance is not by any means tempting.

It was a practice in the thirteenth century to seize all ecclesiastics found walking abroad between Easter and Pentecost, and make them purchase their liberty with

money. This was in memory of the seizure of the Apostles after CHRIST'S passion. "We have still," says a recent writer, "what appears to be a relic of this fashion in a custom which exists in various parts of England. A band of young men goes abroad, and whatever female they meet, they take hold of her, and pull off her shoes, which are only returned to her upon her paying some trifling forfeit." Brand informs us that, at the time he wrote, the youths in the villages of Yorkshire had a practice of unfastening and carrying away the maidens' buckles on Easter Sunday: that on Easter Monday the young women made similar reprisals, and that on the Wednesday the above articles were redeemed by small presents, out of which an entertainment called a Tansy cake was made, with dancing. A similar usage formerly obtained at Ripon, celebrated for its manufacture of spurs, and travellers riding through that town were stripped of these appendages, which, in like manner, they had to redeem. A correspondent in the *Every Day Book* relates, that, in Durham it is common, on Easter Sunday, for a number of boys to assemble in the afternoon, and as soon as the clock strikes four, scour the streets in parties, and accost every woman they meet with "pay for your shoes if you please," at the same time stooping to take them off, which, if they do, and do not immediately get a penny or two-pence, they will actually carry off by main force. "On Easter Monday," he adds, "the women claim the same privilege towards the male sex. They begin much earlier in the day, and attack every man and boy they can lay hold of to make them *pay for their shoes*; if the men happen to wear boots, and will not pay anything, the girls generally endeavour to seize their hats and run off. If a man catches the girl with the hat, it is usually thrown or handed about to the great amusement of the spectators, till the person is baffled out of a sixpence to redeem the right of wearing it again; but this, like all other old customs, has greatly fallen off lately, and is now chiefly practised by a few children." A very singular custom formerly prevailed at Lostwithiel, in Cornwall, on the Feast of the Resurrection. The freeholders of the town and manor having assembled, either in person or by their deputies, one among them, gaily attired and gallantly mounted, with a sceptre in his hand, a crown on his head, a sword borne before him, and respectfully attended by all the rest on horseback, rode through the principal street to the church. At the churchyard stile he was met by the clergyman, who conducted him to hear Divine Service. On leaving the church, he went with the same pomp and retinue, to a house previously prepared for his reception. Here a feast, suited to his assumed dignity, awaited him and his suite; and he was served kneeling, with all the observances that a real prince might expect. After dinner he disrobed, and descended from his transient exaltation. This usage seems to have originated in the actual appearance of the prince, who resided at Restormel castle in former ages. On the removal of royalty, this mimic grandeur stepped forth and continued for many generations, as its shadowy representative.

The "Antiquarian Repertory" affirms, that at Queen's College, Oxford, the first dish brought to the table on Easter Day is a red herring riding away on horseback: that is to say, a herring placed by the cook, something after the likeness of a man on horseback, set in a corn salad. "This," says Hone, "is the only vestige of the pageants which formerly were publicly exhibited by way of popular rejoicing for the departure of the forty days' Lent Fast, and the return to solid eating, with the Easter Festival. The viands appropriate to Easter Day in the old times were eggs, bacon, tansy pudding, and bread and cheese. The origin of the connexion of eggs with Easter may perhaps be thus accounted for. As the whole living world went into the ark and were shut up for a season, like the life in the egg, so by the egg, the ancients for ages symbolized the tradition of that great event, bringing eggs to the altars of their gods.

The entrance of CHRIST into the tomb, and His deliverance from its thrall, were at once typified by the ark, and the egg its symbol. And hence, throughout Christendom, the egg seems to have become allied to the feast of the Resurrection. Paschal eggs are as common in Russia as in England. "At Moscow, on Easter Monday," says Mr. Howitt, "lovers to their mistresses, relatives to each other, servants to their masters, all bring ornamented eggs. The meanest pauper in the street, presenting an egg and repeating the words *Christos vosress!* [CHRIST is risen!] may demand a salute even from the empress." We learn from the same authority that in France, in the week preceding Easter, baskets full of eggs boiled hard, of a red or violet colour, are seen in the streets, and the children amuse themselves by playing with and afterwards eating them. Throughout the country of Bon-neval, on the day before Easter Sunday, and during the first days of Easter week, the clerks of the different parishes, headles, and certain artisans, go about from house to house to ask for their Easter eggs. In Germany, coloured eggs, and little loaves of confectionery, are laid about in the garden among the grass and bushes on Easter Day, and the children are told that "on this night the hares have laid eggs," and bade to go out and look for them. This is one of the Germans' most favourite fictions. The father, mother, and all the elder brothers and sisters, make as much pretence about these hares' eggs and sugar loaves, as concerning their Christmas CHRIST-child and his gifts, and take as much delight in the surprise of the children on discovering these many-coloured eggs, as is felt by the children themselves. Hyde, in his "Oriental Sports," remarks that the youth of the Christians of Mesopotamia, on Easter Day, and forty days afterwards, buy as many eggs as they can, and stain them red, green, or yellow. These they strike one against another, and the egg that first breaks, is won by the owner of the egg that struck it. Immediately another egg is pitted against the winning egg; and so they go on till the last remaining egg wins all the others which their respective owners shall before have won. On Easter eve, and Easter Day, the heads of families sent to the church large chargers filled with hard boiled eggs, which were blessed by the priest. In a curious Roll of the expenses of the household of Edward I. is the following item in the accounts of Easter Sunday: "Four hundred and half of eggs, eighteen pence." These were procured in order to have them coloured, or covered with leaf-gold, and afterwards distributed. At this day the Easter (or as they are called, *paste* or *pace*, a corruption of *Pasch*) eggs used in England are boiled hard, and beautifully stained; some by boiling them with different coloured ribbons bound round them; others, by dyeing them of one colour, and scraping it away in a variety of figures; others by boiling them in the coating of an onion. In the midland counties these are rarely met with; but in Yorkshire, Lancashire, and so Northward, they abound. In Cumberland and Westmoreland, the boys play with them in the fields, rolling them up and down like balls upon the ground, or throwing them up like balls in the air. Even in Scotland, where holidays and holiday customs are almost unknown, a like amusement at this season prevails. When the eggs are broken the children make a feast of their contents. It was usual, in former times, to regale upon a gammon of bacon, in signification of abhorrence to Judaism, on Easter Day. This was, indeed, a day of shame and danger to the Jews; the duty of spitting in an Israelite's face, and throwing stones at his doors and windows, being considered as necessary an observance as the attending church. The tansy seems to have been introduced among Easter viands, as a successor to the bitter herbs used by the Hebrews at their Passover. Tansy cakes were usually presented well sugared.

RELIGIOUS OBSERVANCES.

At Durham Abbey, betwixt three or four o'clock in

the morning of Easter Day, two of the eldest monks of the quire went to the Easter "Sepulchre," which being covered with red velvet and embroidered with gold, these monks with a pair of silver censers, censured on their knees. Then both rising went to the "sepulchre," out of which they took a very beautiful image of the Resurrection, with a cross in the hand of the image of CHRIST, in the breast of which was inclosed in bright crystal, the holy Sacrament, so as to be conspicuous to the beholders. Then, after the elevation of the above "picture," it was carried by the two monks upon a velvet-embroidered cushion, the monks singing the anthem of *CHRISTUS resurgens*. They then brought it to the high altar, setting it on the midst thereof, and the two monks, kneeling before the altar, censured it all the time that the rest of the quire were singing the anthem, which being ended, the two monks took up the cushion and picture from the altar, supporting it betwixt them, and proceeded in procession to the south quire door, where there were four "ancient" gentlemen belonging to the quire, appointed to attend their coming, holding up a rich canopy of purple velvet, tasselled round about with red silk and gold fringe; and then the canopy was borne by these ancient gentlemen, over the said image, with the Host carried by the two monks round about the church, the whole quire following, with torches and tapers; all singing, rejoicing, and praying, till they came to the high altar again; upon which they placed the said image, there to remain till Ascension Day.

April 23d.—St. George's Day.

St. George, the patron of England, whose name occurs on this day in the Kalendar of the English Church, was born in Cappadocia, of noble Christian parents. After the death of his father he went with his mother into Palestine, she being a native of that country, and having there a considerable estate, which fell to her son George. He was strong and robust in body, and, having embraced the profession of a soldier, was made a tribune, or colonel, in the army. By his courage and conduct, he was soon preferred to higher stations by the Emperor Dioclesian. When that prince waged war against Christianity, St. George laid aside the marks of his dignity, threw up his commission, and complained to the emperor himself of his sanguinary edicts. He was immediately cast into prison, and first tried by promises, and afterward put to the question, and tortured with great cruelty: but nothing could shake his constancy. The next day he was led through the city, and beheaded. "The extraordinary devotion," says Alban Butler, "of all Christendom to this saint, is an authentic proof how glorious his triumph and name have always been in the Church." The Greeks have long distinguished him by the title of the Great Martyr, and keep his festival a holiday of obligation. The great national council, held at Oxford in 1222, commanded his feast to be kept a holiday of the lesser rank throughout England. The reason why St. George has been regarded the patron of military men, is partly on account of his profession, and partly upon the credit of a relation of his appearing to the Christian army in the Holy War, before the battle of Antioch. He is usually figured on horseback, and tilting at a dragon under his feet: "but this representation," says Butler, "is no more than an emblematical figure, purporting, that, by his faith and Christian fortitude, he conquered the devil, called the dragon in the Apocalypse."

Under his name and ensign was instituted, by our victorious King Edward III., in 1330, the most noble order of knighthood of Europe, consisting of twenty-five knights, besides the sovereign. In 1786 six were added, in consequence of the increase of the Royal family. "The order of St. George, our patron saint," observes a modern writer, "founded by King Edward, of famous memory, is yet the highest honour that can be conferred by sovereigns on the subject; and his

chapel is glorious, and his feast kept solemnly." Much valuable information respecting this festival, as celebrated by the English monarchs since the Reformation, is given in the interesting pages of the *Hierurgia Anglicana*. Thence we learn, that on St. George's Day, 1561, "all her Majesty's chapel came through her hall in copes, to the number of thirty, singing, 'O God the Father of Heaven, &c.,' the outward court and the gate round about being strewn with green rushes. After, came Mr. Garter, and Mr. Norroy, and Master Dean of the chapel, in robes of crimson satin, with a red cross of St. George. And after, eleven knights of the garter, in their robes. Then came the Queen [Elizabeth], the Sovereign of the order, in her robes, and all the guard following, in rich coats: and so to the chapel." At p. 305 of the above work, is an account of the "Grand procession at Windsor, &c., on the festivals of St. George," which, so recently as the fifteenth year of the reign of Charles II., was conducted with extraordinary solemnity and magnificence. Brand states, that blue coats were formerly worn by people of fashion on St. George's Day, and that among the Fins, whoever makes a riot on this festival, is in danger of suffering from storms and tempests.

April 25th.—Feast of St. Mark.

This festival has annually been celebrated from its first institution in 1090. Upon this, and the first three days of the Rogation week, there were, in old times, processions by the prior and monks of Durham to one of the parish churches. Blessings on the corn were formerly implored on this day: and, according to Pennant, no farmer in North Wales "dare hold his team" on this festival, because it is there believed "one man's team that did work that day was marked with the loss of an ox."

THE ETERNAL BURDEN.

THE Caliph Hakkam, who loved pomp, wished to enlarge and adorn the gardens of his palace. For this purpose he bought the surrounding land, and paid the proprietors as much as they demanded for it. There remained only a poor widow, who, from pious motives, refused to sell the inheritance of her ancestors, and rejected every application which was made to her. The overseer of the royal buildings was provoked by this woman's obstinacy; he seized upon her little patrimony, and the poor widow came weeping to the judge.

Ibn Beschir was then Cadi of the town. He duly considered the case brought before him, and found it a delicate one; for although by an ancient statute the widow was proved indubitably in the right, yet it was by no means easy to dispose a prince who was accustomed to consider his will perfect justice, to the voluntary fulfilment of an antiquated law.

What then did the just Cadi do? He saddled his ass, hung a large sack over its back, and rode immediately to the palace garden, where he found the Caliph seated in the beautiful building he had erected on the widow's land.

The appearance of the Cadi, with his ass and sack, greatly astonished him; and he was still more surprised when Ibn Beschir threw himself at his feet, and said, "Permit me, Sire, to fill this sack with earth from these grounds."

Hakkam assented; and when the sack was filled, Ibn Beschir entreated the Caliph would assist him to lift it upon the back of the ass. Hakkam thought this demand stranger than the foregoing one; but in order to see what the man had in his mind, he endeavoured to help him. The sack,

however, could not be raised; and the Caliph said, "The burden is too heavy, Cadi—it is impossible."

"Sire," answered Ibn Beschir, with noble confidence, "you find this burden too heavy, and it only contains a small portion of the earth which you have unjustly taken from the poor widow: how then shall you bear the whole of this stolen land, which the Judge of all the world will lay upon your shoulders in the day of judgment."

The Caliph was struck with the force of these words; he praised the conduct of the Cadi, and gave back to the widow all her inheritance, with the buildings he had raised upon it.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE HOUSEHOLD.

[T.]

UPON a sunny spot a garland lay,
Each diff'ring flower doubling th' other's grace,
When rough storms rose and blew them all away,
And not one blossom told that garland's place.
"Soft sweeping breezes, pitying, come and chase
Those lovely ones again, and bring them nigh;
Or shall they, onward borne in that forced race,
Asunder wither, and asunder die?"
Then he who laid them there again passed by,
And saw how scattered all his fair ones were,
And took them up, and placed them carefully
In his sweet home—they bloomed together there.
All gentle zephyrs soothing came around,
And poured their healing over every wound.

STANZAS.

BY S. M.

WITEN, on the beautiful Azores,
The wanderer stood in olden days,
And saw the line of distant shores
Gleam faintly on his wistful gaze,
Then melt into the blazing sky
As martyred saints in glory die:

Those phantom shapes of fancy born,
But to the dreamer's eye displayed,
Fled the calm face of brightening morn,
Fading, as gathered blossoms fade;
Yet, scarce the wildest Hope had guessed
There lay a WORLD in that far West!

Thus, on Life's airy summit stands
The Poet, and with eye intent
Watches for bright ideal lands
Fringing the massy firmament,
Vague forms that fill with living grace
For him, the solitudes of space.

The drifting cloud, the growing flower,
Morn, midnight, eve, or twilight dim,
Teem with a Presence and a Power,
Making the bliss of earth to him;
He hears in every twinkling breeze
Snatches of heavenly cadences.

And oft from hours that wander past,
Strange voices speak, in joy or woe,
Sweeping his heartstrings as a blast
Whose source and aim he may not know.
Unreal his visions seem to be
As those faint shores by that far sea!

Men, ye who mock those dreams so fond,
That fade before the gazer still,
Think on the WORLD that lies beyond,
And then, disdain them if ye will!
Shadows—scoff on! The words are sooth
But shadows of substantial truth!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

THE TURKOMAUN'S POWER OF SMELLING.

AN extraordinary power of smelling in a Turkomaun was indicated to me—"I smell a caravan of Usbecks," said Khan Saat, drawing up his nostrils; and in a few hours a caravan from Organtsh arrived full of them. It is remarkable how the Turkomauns know, by the footsteps in the desert, the person who has been there, nay, the very tribe of Turkomauns or Calmuks see people talking from a distance. I frequently heard them say, "Let us draw our ears." They then lie down on the ground, and hear from a distance what even two persons whisper together, and relate the exact conversation.—*Dr. Wolff's Mission*.

"A GOOD FELLOW, NOBODY'S ENEMY BUT HIS OWN."

It hath oftentimes been matter of wonderment to me how many phrases do come to be received as current coin in the world, which for certain were never lawfully stamped in the mint of either religion or reason; and, among those brass shillings of society, I know none that better deserveth to be nailed to the counter than the one above placed; for many an idle young man hath, before now, found it the last in his pocket, and haply hath exchanged it for a pistol bullet, thinking himself a gainer by the bargain. If man grew to a rock like a limpet, then might he haply be his own enemy without any great harm to his neighbours; but he who liveth in society, and faileth to perform his part aright in the station assigned to him, doth all that in him lieth to destroy the body politic. He who is delivered over to vice and drunkenness—for such being interpreted is the meaning of a good fellow who is only *his own enemy*,—setteth a bad example to his dependents; squandereth his fortune on unworthy objects, to the neglect of all that he might and ought to have done towards the relief and advance of the deserving; plungeth his family into difficulties—grieveth, shameth, and perhaps starveth them; ruineth his health, so as to make himself a burthen to those about him; and finally, after having been a bad citizen, a bad master, a bad husband, a bad father, sinketh into the grave with a soul so irrecoverably poisoned by habits of sensuality and gross earthliness, that it would seem rather fit to rot with its putrefying companion, than to enter into any region of spiritualized existence. And this man who hath fulfilled no one duty, but on the contrary hath spread around him a dank atmosphere of sin, is called "a good fellow," merely because he hath done all this with an air of reckless gaiety, which showed an utter absence of any feeling for the beings he was rendering miserable! Verily the world's measure is wofully short of the standard cubit and ephah of the sanctuary.—*Exposition of Vulgar Errors, by Thomas Brown Redivivus*.

A GENUINE PHILANTHROPIST.

THE island of Rona is a small and very rocky spot of land, lying between the isle of Skye and the mainland of Applecross, and is well known to mariners for the rugged and dangerous nature of its coast. There is a famous place of refuge at its north-western extremity,

called the "Muckle Harbour," of very difficult access, however, which, strange to say, is easier entered at night than during the day. At the extremity of this hyperborean solitude is the residence of a poor widow, whose lonely cottage is called "the lighthouse," from the fact that she uniformly keeps a lamp burning in her little window at night. By keeping this light and the entrance of the harbour open, a strange vessel may enter with the greatest safety. During the silent watches of the night the widow may be seen, like Norna of the Fitful Head, trimming her little lamp with oil, fearful that some frail bark may perish through her neglect; and for this she receives no manner of remuneration—it is pure and unmingled philanthropy. The poor woman's kindness does not rest even here, for she is unhappy until the benumbed and shivering mariner comes ashore to share her little board, and recruit himself at her glowing and cheerful fire, and she can seldom be prevailed upon to accept of any reward. She has saved more lives than Davy's belt, and thousands of pounds to the underwriters. This poor creature, in her younger days, witnessed her husband struggling with the waves, and swallowed up by the remorseless billows—

"In sight of home and friends that thronged to save."

This circumstance seems to have prompted her present devoted and solitary life, in which her only enjoyment is doing good.

MORALITY OF SHAKSPEARE.

SHAKSPEARE has no innocent adulteries, no interesting incests, no virtuous vice,—he never renders that amiable which religion and reason alike teach us to detest, or clothes impurity in a garb of virtue, like Beaumont and Fletcher, the Kotzebues of the day. Shakspeare's fathers are roused by ingratitude, his husbands stung by unfaithfulness; in him, in short, the affections are wounded in those points in which all may, nay, must, feel. Let the morality of Shakspeare be contrasted with that of the writers of his own or the succeeding age, or of those of the present day, who boast their superiority in this respect. No one can dispute that the result of such a comparison is altogether in favour of Shakspeare: even the letters of women of high rank in his age were often coarser than his writings. If he occasionally disgusts a keen sense of delicacy, he never injures the mind; he neither excites nor flatters passion in order to degrade the subject of it; he does not use the faulty thing for a faulty purpose, nor carries on warfare against virtue, by causing wickedness to appear as no wickedness through the medium of a morbid sympathy with the unfortunate. In Shakspeare vice never walks as in twilight: nothing is purposely out of its place; he inverts not the order of nature and propriety—does not make every magistrate a drunkard or a glutton, nor every poor man meek and humane.—*Coleridge*.

THE age of crusades, chivalry, romance, and minstrelsy, was an intellectual spring among all the nations of the west.—*Schlegel*.

THE higher a monkey climbs the more he shows his tail.

LONDON:
PRINTED BY RICHARD CLAY,
BREAD STREET HILL.

P R E F A C E.

WHEN such a publication as this has reached the completion of its second Volume, the time for proclaiming the purpose for which it was established, and the objects which it seeks to effect, would appear to have gone by. It must have been less successful in embodying its views and aims than, we trust, we shall be found to have been, if these are not now sufficiently understood by its habitual readers, to render any detailed exposition of them unnecessary.

On one point only we think it right to offer a word of explanation. We have heard it objected, in all friendliness and good-feeling, to the management of this Magazine, that there seems in it a want of some definite aim, towards which its efforts should be systematically pointed; that it is too vague, desultory, and indeterminate in its objects, moving rather, like a butterfly, from flower to flower, than, like an arrow, straight to its mark. May we be permitted, with all respect for our friendly critics, to justify ourselves in this matter. The *Spectator* requested his friends, if at any time they found him particularly dull, to believe that he had a design under it. In like manner we, not in jest, but most seriously, request our friends to receive our assurance, that the indeterminateness of which they complain has been part of our plan; that, if our aim has been less obvious than that of some other publications, it is because it has been more comprehensive; and that it is not the less real, nor, we hope, less likely to be reached, that we are not exhibiting it at every turn, and constantly talking about it.

We have no desire to depreciate the value of their labours, whose avowed object it is to advance the material interests of particular classes of the people. We merely say that our aim has been a different one. In our first number we disclaimed the intention of addressing ourselves to the limited sympathies of any particular class. It was, therefore, necessary for us to avoid, as far as practicable, those subjects of discussion, the interest attaching to which might bear in any respect a sectional character. Our object has been, making our field as wide as possible—having something for all, and nothing which could exclude any—to present subjects of all sorts in such a dress, and to infuse into the treatment of them such a spirit, as would bear with the most improving and elevating effect upon the moral and intellectual character of readers of every class. While we have laboured assiduously to collect from all quarters valuable information—solid tangible facts—a substantial *body* of knowledge, we have made it our business never to present that body to our readers, without the attempt, at least, to breathe a *soul* into it,—to give it a value beyond its mere physical worth,—to make it, to some small extent, a means of familiarising the mind with lofty thoughts—with tender feelings—with fine and true sensibilities—with all that dwells in the nobler and better part of man.

In thus denying ourselves to objects of direct individual or sectional interest, for the sake of what we regard as higher objects of universal interest, we are perfectly aware that we place ourselves under some disadvantage in stating our claims to public support. That which we appeal to is less palpable—goes less directly home to the business and bosoms of many readers, than might be the case with other more limited objects. But our confidence is, that, once understood and appreciated, its influence will be more enduring—less liable to be disturbed by cross accidents, or changes of popular feeling,—and establishing a relation between author and reader, more honourable in its character, and more beneficial in its results.

We may take this opportunity of saying a word or two on the future conduct of this Magazine. No exertion will be spared to maintain unimpaired the character which it has now acquired. Artists of the highest eminence are at present engaged in the preparation of illustrations for the forthcoming numbers, which, it is confidently expected, will equal any that have yet appeared even in this Magazine, and some of which will surpass anything that has ever been seen in any publication of far greater price. And we can now boast of an organized corps of literary contributors, in which are to be found both ladies and gentlemen of the highest talent and acquirements, and some of them of much literary experience.

P R E F A C E.

A large circle of readers will be gratified to hear that the author of "Frank Fairlegh" has undertaken to furnish, for the forthcoming Volume, a continuation of the adventures of that general favourite. The series of beautiful and affecting sketches, bearing the title of "The Maiden Aunt," is also to be continued in the Volume. And the other papers which are either prepared, or in preparation, will, we think we can promise, not merely sustain the character of the Magazine up to the point it has already reached, but also show that we have not been inattentive to, or unwilling to profit by, the criticisms and suggestions of a public whom we have hitherto found so favourable and indulgent. .

While on this subject, let us return our respectful thanks for a great variety of interesting and able communications and contributions, which we have found it altogether impossible to acknowledge separately. The necessity under which we have been placed of declining to avail ourselves of a great number of these, has been frequently a cause of deep regret to ourselves. It has been, indeed, a necessity, arising, in a considerable proportion of cases, not from our having formed an unfavourable opinion of the literary merits of the offered contributions, or even of their suitability for this Magazine, but simply from the physical impossibility of including more than a limited quantity of letter-press within our weekly sixteen pages. In order to prevent, for the future, as far as lies in our power, any persons from subjecting themselves unnecessarily to the risk of disappointment, we beg now to announce that our arrangements for the regular supply of such papers as we require are completed, and that, therefore, we do not solicit contributions from the writing public generally. Such as may continue to be sent will be respectfully received ; as carefully read as may be consistent with our other arrangements ; and replied to without any unnecessary delay. But the authors of such papers will be so good as keep in view, that, without at all fettering our freedom of choice, we must, *cæteris paribus*, give a preference to those upon whom we can rely for our regular supply of such papers as we need, and that we cannot, in common fairness, suffer them to be elbowed aside by casual contributions, except when these are of such manifest excellence, as that their rejection or postponement would be a positive injustice to the Magazine.

After this intimation, which we trust will be received in the spirit in which it is given, it is only reasonable that we should request to be allowed our own time in replying to *unsolicited* communications. Those only who have had experience of similar publications can form any idea, how serious an encroachment upon the time of both Editor and Publisher is occasioned by having to examine and reply to communications of no value whatever to the Magazine. We shall treat no person with intentional discourtesy ; but, as we do not ask for contributions, those who voluntarily send any, must feel that they can have no right to complain, if we postpone the consideration of them to such matters as have a more legitimate claim upon our attention. Importunate urgency, such as we have sometimes been subjected to, will undoubtedly succeed in extracting a reply from us out of the regular course ; but it is as well that those who may be disposed to have recourse to it should be aware, that the answer in that case is always of one kind—the rejection of the paper offered.

GLIMPSSES OF VILLAGE LIFE.

KATHARINE PENFOLD.

A most intricate lane is Bower Lane, branching out into a multitude of bridleways, and (so to speak) lanelets, leading to isolated farms, cavernous gravel pits, and reedy pools,—a rugged tortuous lane winding through orchard grounds, and hop gardens, and slopes of pasture land,—now dipping into sombre hollows roofed by the meeting boughs of overhanging trees, now climbing to the top of pleasant knolls, from which you catch a glimpse of glistening waters creeping through the valley at your feet, and then piercing the very centre of the Farleigh woods, and leading you among the richest sylvan scenes, so wild, so seemingly remote from every sound of human life, that one almost looks to meet within its leafy precincts the fauns and nymphs and hamadryads of antique song.

Midway between the woods and L——, niched in a lordly group of elms, that, sweeping in a semicircle round the rear, form a glorious framework for the cottage and its sloping plot of garden-ground, stands Bower Court, the fragmentary relic of a noble house. Fragmentary indeed it is, as though the architect had been a "snapper up of unconsidered trifles," gathering from the wreck of a majestic old mansion a picturesque and motley salvage; now laying hands upon a portion of the cloistered colonnade, and now appropriating entire a very jewel of a porch, nor scrupling for a moment to avail himself of quaint old gable ends, carved window frames, fantastic coigns, and such other waifs and strays as fell within his reach. And, when he had combined all these, and when "boon nature" had beneficently hung a tapestry of shining ivy-leaves above the jutting porch, and gentle hands had trained some flowering parasites to weave a lavish net-work for the southern front; and when the summer sunshine shone upon its walls, and birds were carolling in the elms behind, and bees were humming in and out of the garden flowers, and "the murmur of a hidden brook," stealing along beneath dense hedge-rows, made happy music to the ear, you may believe that, to the eyes of such poor book-worms as ourselves, the Court appeared the very hermitage a literary eremite would choose to wear away his summer hours in.

Swallows delight to make it their abode, and never do we pass it by but these exquisite lines recur to mind:—

"The temple-haunting martlet does approve,
By his loved mansionry, that the heaven's breath
Smells wooingly here; no jutting, frieze,
Buttress, nor coign of vantage, but this bird
Hath made his pendent bed and procreant cradle.
Where they most breed and haunt, I have observed
The air is delicate."

For many a year the Court enjoyed the reputation of a haunted house. Children would speak of it with "bated breath"; and elder folks, belated in their evening walk, would hurry past it with averted eyes, and tremble if they heard the ivy rustle round the porch. And counted most assuredly it is, (though happily, in the popular belief, the sprites have long ago been laid to rest,) by a spirit delicate as Ariel, gentle as the "lady wedded to the Moor," and, more than this, imbued with all the earnest love and filial tenderness of a Cordelia. A warm eulogium, and yet not undeserved; as you yourself would honestly confess upon acquaintance with its object. Knowing her, you could not fail to love her; and, loving her, you would be sure to superadd a feeling almost reverential for her devoted affection to the blind old man, her father, who depends for his support in part on her exertions as a daily governess, in part upon the slender stipend he receives as organist at L——.

In the whole range of our acquaintance, we do not know of two such delightful associates as our organist

and his pretty daughter. The old man so full of anecdote; so sprightly in his wit; so copious, and withal so justly discriminating, in his criticisms upon our literature, with whose riches Katharine's reading has familiarized him; so shrewd, and often times so happy, in his judgment of individual character—a judgment built upon no better basis than the inflexions of the voice; so cheerful in the deprivation of his sight; so enthusiastic in his passion for "solemn sounds, sweet airs," and "old, old songs, the native music of the hills;" and so eager and thankful a listener to the comments of others upon the fine arts—painting and statuary more especially—and the beauty of the visible world, to him, alas! "banned and barred, forbidden fare." And Kate—silver-tongued and soft-eyed Kate,—Kate with the lyric voice and cunning hand,—where should we look to find so pleasant a companion for the winter fire-side, or the summer ramble, as the fair daughter of our blind old organist? Yet Katharine Penfold, with all her manifest and manifold attractions and accomplishments, is a confirmed and steadfast spinster. Offers she has had by the dozen, and, unexceptionable as many of them have been, she has uniformly met them with a courteous but prompt denial. "She has no wish for change—no thought of abandoning her pleasant home—no room for other love within her heart than that she cherishes towards her father," and, blushing as she diffidently stammers forth her thanks, our village beauty, by the very soothing and gentle character of her denial, invariably augments the passion she has unwittingly inspired. Nothing, it seems, can win her from her celibate, or tempt her to exchange the arduous duties of her daily life, for the ease and competence which the prosperous circumstances of some of her suitors would certainly ensure her. He would be a proud and happy man who should confer his name on Katharine Penfold, for he would be, indeed,

"Most richly blest

In the calm meekness of her woman's breast,

Where that sweet depth of still contentment lies;

And for her household love, which clings

Unto all ancient and familiar things,

Weaving from each some link for home's dear charities."

Twice in the week Kate's homeward path lies through L——, and, during all the pleasant summer months, at the coming on of twilight, her father meets her at the church, and tarries there till nightfall, filling that old and echoing pile with the throbbing music of the solemn organ,—improvising voluntaries,—weaving together fragments of masses, requiems, and symphonies, or revelling in the jubilant notes of some high-soaring anthem song, in which the quivering voice of Katharine blends with the organ's tremulous swell,—floats along the vibrating and dusky air,—startles the sleeping echoes,—murmurs high up among the massive rafters of the roof,—rings audibly against the window panes—and, wandering outward through the porch, arrests the footsteps of the passer by, constraining him to pause and listen to the music of the blind old organist, and the carol, the clear exulting carol, of his daughter's voice. And, when the gathering darkness warns Katharine and her father to depart, it is a chance if there be not some young and loving loiterer in the aisle below, waiting to proffer, with an eager importunity, his services as an escort home. And, if the offer be accepted, what a heavenly beauty is there in that tranquil summer night, to the buoyant fancy of the happy escort! with what a rare consummate charm are even ordinary and familiar objects invested for the nonce! "Think you that, to his ears, music was ever so divine as the sound of Katharine's voice mingling in the conversation which beguiles their walk? Think you that ever distance seemed so brief as that which intervenes between the village and the 'Court?'—that ever walk appeared so long, so wearisome, as the subsequent solitary retracing of his steps? Think you that, to the eye of shipwrecked mariner, ever

star shone forth so brightly as shines the twinkling light from Katharine's casement, to which so often his averted glance is turned? or that the pitchy darkness of a winter's night seemed ever so profound as that which settles down when intermediate trees obscure the gleam of that far-shining light? And think you, that, with so many "shaping their services to her behests," Kate's resolute adhesion to a single life will still remain unshaken? We must confess we entertain a half mistrustful feeling on this score. But, most assuredly, if ever so important an event as Katharine Penfold's marriage should take place, we will not fail to duly notify the occurrence, with ample details of the ceremony, to the readers of our Village Annals.

J. S.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

I HAVE, from time to time, amused a leisure hour by committing to paper the following recollections of my boyish days. My reasons for doing so were briefly these. It struck me, that, while volume after volume had been devoted to "school-boy days," "college life," &c., the mysteries of that paradise of public-school-fearing mamas, a private tutor's, still remained unrevealed. In hastening to avail myself of this (as far as I am aware) hitherto untried ground, I have had in view (in addition to my professed design of amusing myself, and—may I venture to hope it?—my readers also,) the following objects:—in the first place, to enlighten the aforesaid mamas as to the nature of the bed of roses to which they are so anxious to transplant their darlings, and to show some of the trials and temptations to which a lad, hitherto shielded from evil by all the hallowing influences of home, may (despite the best intentions on the part of his tutor) be exposed; and, secondly, to prove to the "young gentlemen" themselves, how, by a little firmness and decision of character, and a sensible and manly adherence to the religious principles in which they have been brought up, they may, without forfeiting the regard of their companions, do good in their generation, and lay the foundation of the character which it should be their aim to support through life; viz., that of Christians and Gentlemen. How far I may have succeeded in accomplishing these objects, it is not for me to decide.

CHAPTER I.

"Never forget, under any circumstances, to think and act like a gentleman, and don't exceed your allowance," said my father. "Mind you read your Bible, and remember what I have told you about wearing flannel waistcoats," cried my mother. And with their united "God bless you, my boy!" still ringing in my ears, I found myself inside the stage coach, on my way to London.

Now, I am well aware that the correct thing for a boy in my situation (*i.e.* leaving home for the first time) would be to fall back on my seat, and into a reverie, during which, utterly lost to all external impressions, I should entertain the thoughts and feelings of a well-informed man of thirty; the same thoughts and feelings being clothed in the semi-postic prose of a fashionable novel writer. Deeply, therefore, am I grieved at being forced both to set at nought so laudable an established

precedent, and to expose my own degeneracy. But the truth must be told at all hazards. The only feeling I experienced, beyond a vague sense of loneliness and desolation, was one of great personal discomfort. It rained hard, so that a small stream of water, which descended from the roof of the coach as I entered it, had insinuated itself between one of the flannel waistcoats which formed so important an item in the maternal valediction, and my skin, whence, endeavouring to carry out what a logician would call the "law of its being," by finding its own level, it placed me in the undesirable position of an involuntary disciple of the cold-water system taking a "sitz-bad." As to my thoughts, the reader shall have the full benefit of them, in the exact order in which they flitted through my brain.

First came in a vague desire to render my position more comfortable, ending in a forlorn hope that intense and continued sitting might, by some undefined process of evaporation, cure the evil. This suggested a speculation, half pleasing and half painful, as to what would be my mother's feelings, could she be aware of the state of things; the pleasure being the result of that mysterious preternatural delight which a boy always takes in every thing at all likely to injure his health, or endanger his existence, and the pain arising from the knowledge that there was now no one near me to care whether I was comfortable or not. Again, these speculations merged into a sort of dreamy wonder, as to why a queer little old gentleman opposite (my sole fellow-traveller) went on grunting like a pig, at intervals of about a minute, though he was wide awake all the time; and whether a small tuft of hair, on a mole at the tip of his nose, could have anything to do with it. At this point, my meditations were interrupted by the old gentleman himself, who, after a louder grunt than usual, gave vent to his feelings in the following speech, which was partly addressed to me and partly a soliloquy. "Umph! going to school, my boy, eh?" then, in a lower tone, "wonder why I called him *my* boy, when he's no such thing: just like me; umph!" I replied by informing him that I was not exactly going to school, (I was just fifteen, and the word "school" sounded derogatory to my dignity;) but that, having been, up to the present time, educated at home by my father, I was now on my way to complete my studies under the care of a private tutor, who only received six pupils, a very different thing from a school, as I took the liberty of insinuating. "Umph! different thing? You will cost more, learn less, and fancy yourself a man when you're a little boy; that's the only difference I can see." then came the aside,—"Snubbing the poor child, when he's too low already; just like me; umph!" After which he relapsed into a silence which continued uninterrupted until we reached London, save once, while we were changing horses, when he produced a flask with a silver top, and, taking a sip himself, asked me if I drank brandy. On my shaking my head, with a smile caused by what appeared to me the utter wildness and desperation of the notion, he muttered, "Umph! of course he doesn't; how should he?—just like me."

In due course of time we reached the Old Bell Inn, Holborn, where the coach stopped, and where my trunk and myself were to be handed over to the tender mercies of the coachman of the "Rocket," a fast coach, (I speak of the slow old days when railroads were unknown,) which then ran to Holmstone, the watering-place where my future

tutor, the Rev. Doctor Mildman, resided. My first impressions of London are scarcely worth recording, for the simple reason that they consisted solely of intense and unmitigated surprise at everything and everybody I saw and heard; which may be more readily believed when I mention the fact, that my preconceived notions of the metropolis led me to imagine, that perhaps it might be twice the size of the town nearest to my father's house, in short, almost as large as Grosvenor Square.

Here I parted company with my fellow-traveller, who took leave of me thus—"Umph! well, good bye; be a good boy—good man, you'd like me to say, I suppose; man indeed! umph! don't forget what your parents told you;" then adding, "Of course he will, what's the use of telling him not? just like me;"—he dived into the recesses of a hackney coach, and disappeared. Nothing worthy of note occurred during my journey to Helmstone, where we arrived at about half-past four in the afternoon. My feelings of surprise and admiration were destined once more to be excited on this (to me) memorable day, as, in my way from the coach-office to Langdale Terrace, where Doctor Mildman resided, I beheld, for the first time, that most stupendous work of God, the mighty Ocean; which, alike in its wild resistless freedom, and its miraculous obedience to the command, "Thus far shalt thou come, and no further," bears at once the plainest print of its Almighty Creator's hand, while it affords a strong and convincing proof of His omnipotence.

On knocking at the door of Doctor Mildman's house, (if the truth must be told, it was with a trembling hand I did so,) it was opened by a man-servant, whose singularly plain features were characterised by an expression alternating between extreme civility and an intense appreciation of the ludicrous.

On mentioning my name, and asking if Doctor Mildman was at home, he replied, "Yes, sir, master's in, sir; so you're Mr. Fairleigh, sir, our new young gent., sir?" (here the ludicrous expression predominated;) "hope you'll be comfortable, sir," (here he nearly burst into a laugh;) "show you into master's study, sir, directly," (here he became preternaturally grave again;) and opening the study door, ushered me into the presence of the dreaded tutor.

On my entrance, Doctor Mildman (for such I presumed a middle-aged gentleman, the sole tenant of the apartment, to be) rose from a library table, at which he had been seated, and, shaking me kindly by the hand, inquired after the health of my father and mother, what sort of journey I had had, and sundry other particulars of the like nature, evidently with the good-humoured design of putting me a little more at my ease; for I have no doubt the trepidation I was well aware of feeling inwardly, at finding myself *tête-à-tête* with a real live tutor, was written in very legible characters on my countenance. Doctor Mildman, whose appearance I studied with an anxious eye, was a gentlemanly looking man of five-and-forty, or thereabouts, with a high bald forehead, and good features, the prevailing expression of which, naturally mild and benevolent, was at times chequered by that look which all schoolmasters are sure sooner or later to acquire—a look which seems to say, "Now, sir, do you intend to mind me, or do you not?" Had it not been for this, and for an appearance of irresolution about the mouth, he would have been a decidedly fine-looking man. While I was making these observations, he informed me that I had arrived just in time for dinner, and that the servant should show me to my sleeping apartment, whence, when I had sacrificed to the Graces, (as he was pleased to call dressing,) I was to descend to the drawing room, and be introduced to Mrs. Mildman and my future companions.

My sleeping room, which was rather a small garret than otherwise, was furnished, as it appeared to me, with more regard to economy than to the comfort of its inmate. At one end stood a small four-post bedstead, which, owing to some mysterious cause, chose to hold its

near fore-leg up in the air, and slightly advanced, thereby impressing the beholder with the idea that it was about to trot into the middle of the room. On an unpainted deal table stood a looking-glass, which, from a habit it had of altering and embellishing the face of any one who consulted it, must evidently have possessed great natural humour: an ancient wash-hand-stand, supporting a basin and towel, and a dissipated looking chair, completed the catalogue.

Whilst I am engaged in preparing for the alarming ordeal I am so soon to undergo, allow me to present a slight sketch of myself, both mental and bodily, to the reader; and, as mind ought to take precedence of matter, I will attempt, as far as I am able after the lapse of time which has taken place, to paint my character in true colours, "neither extenuating nor setting down aught in malice." I was, then, as the phrase goes, "a very well-behaved young gentleman;" that is, I had a great respect for all properly constituted authorities, and an extreme regard for the proprieties of life; was very particular about my shoes being clean, and my hat nicely brushed; always saying "Thank you," when a servant handed me a plate, and, "May I trouble you?" when I asked for a bit of bread. In short, I bade fair in time to become a thorough old bachelor; one of those unhappy mortals whose lives are alike a burthen to themselves and others,—men who, by magnifying the minor household miseries into events of importance, are uneasy and suspicious about things from the wash having been properly aired, and become low and anxious as the dreaded time approaches when clean sheets are inevitable! My ideas of a private tutor being derived chiefly from "Sandford and Merton," and "Evenings at Home," were rather wide of the mark, leading me to expect that Dr. Mildman would impart instruction to us during long rambles over green fields, and in the form of moral allegories, to which we should listen with respectful attention and affectionate esteem. With regard to my outward man, or rather boy, I should have been obliged to have confined myself to such particulars as I could remember, namely, that I was tall for my age, but slightly built, and so thin, as often to provoke the application of such epithets as "hop-pole," "thread-paper," &c.; had it not been that, in turning over some papers, a few days since, I stumbled on a water-colour sketch of myself, which I well remember being taken by a young artist in the neighbourhood, just before I left home, in the hope of consoling my mother for my departure. It represented a lad about fifteen, in a picturesque attitude, feeding a pony out of a very elegant little basket, with what appeared to be white currants, though I have every reason to believe they were meant for oats. The aforesaid youth rejoiced in an open shirt collar and black ribbon *à la* Byron, curling hair of a dark chestnut colour, regular features, a high forehead, complexion like a girl's, very pink and white, and a pair of large blue eyes, engaged in regarding the white currant oats with intense surprise, as well indeed they might. Whether this young gentleman bore more resemblance to me, than the currants did to oats, I am, of course, unable to judge; but, as the portrait represented a very handsome boy, I hope none of my readers will be rude enough to doubt that it was a striking likeness.

I now proceeded to render myself thoroughly wretched, by attempting to extricate the articles necessary for a change of dress from the very bottom of my trunk, where, according to the nature of such things, they had hidden themselves; grammars, lexicons, and other like "Amenities of Literature," being the things that came to hand most readily. Scarcely had I contrived to discover a wearable suit, when I was informed that dinner was on the table; so, hastily tumbling into my clothes, and giving a final peep at the facetious looking-glass, the result of which was my twisting the bow of my Byronic tie under my left ear, in the belief that I was thereby putting it straight, I rushed down stairs, just in time to

see the back of the last pupil disappear through the dining-room door. "Better late than never, Fairleigh; Mrs. Mildman, this is Fairleigh; he can sit by you, Coleman;—For what we are going to receive, &c.—Thomas, the carving-knife." Such was the address with which my tutor greeted my entrance, and, during its progress, I popped into a seat indicated by a sort of half wink from Thomas, resisting by a powerful act of self-control a sudden impulse which seized me, to rush out of the room, and do something between going to sea and taking prussic acid; not quite either, but partaking of the nature of both. "Take soup, Fairleigh?" said Dr. Mildman. "Thank you, sir, if you please." "A pleasant journey had you?" inquired Mrs. Mildman. "Not any, I am much obliged to you," I replied, thinking of the fish. This produced a total silence, during which the pupils exchanged glances, and Thomas concealed an illicit smile behind the bread basket. "Does your father," began Dr. Mildman in a very grave and deliberate manner, "does your father shoot?"—"Boiled mutton, my dear." I replied, that he had given it up of late years, as the fatigue was too much for him. "Oh! I was very fond of carrying a gun,—pepper,—when I was—a spoon—at Oxford, I could hit a—mashed potatoe—bird as well as most men; yes, I was very sorry to give up my double barrel—ale, Thomas!" "You came inside, I believe?" questioned Mrs. Mildman, a lady possessing a shadowy outline, indistinct features faintly characterised by an indefinite expression, long ringlets of an almost impossible shade of whity-brown, and a complexion and general appearance only to be described by the term "washed out." "Yes, all the way ma'am." "Did you not dislike it very much? it ceases one's gown so, unless it is a merino, or mousseline-de-laine, but one can't always wear them, you know." Not being in the least prepared with an answer suitable to this, I merely made what I intended to be an affirmative grunt, in doing which a crumb of bread chose to go the wrong way, producing thereby a violent fit of coughing, in the agonies of which I seized and drank off Dr. Mildman's tumbler of ale, mistaking it for my own. The effect of this, my crowning gaucherie, was to call forth a languid smile on the countenance of the senior pupil, a tall young man, with dark hair, and a rather forbidding expression of face, which struggled only too successfully with an attempt to look exceedingly amiable; which smile was repeated with variations by all the others. "Thomas, a clean glass," said Dr. Mildman; but Thomas had evaporated suddenly, leaving no clue to his whereabouts, unless sundry faint sounds of suppressed laughter outside the door, indicating, as I fancied, his extreme appreciation of my unfortunate mistake, proceeded from him. It is, I believe, a generally received axiom, that all mortal affairs must sooner or later come to an end; at all events the dinner I have been describing did not form an exception to the rule. In due time Mrs. Mildman disappeared, after which Dr. Mildman addressed a remark or two about Greek tragedy to the tall pupil, which led to a dissertation on the merits of a gentleman named Prometheus, who, it seemed, was bound in some peculiar way, but whether this referred to his apprenticeship to some trade did not appear. This lasted about ten minutes, at the expiration of which the senior pupil "grinned horribly a ghastly smile" at the others, who instantly rose, and conveyed themselves out of the room with such rapidity, that I, being quite unprepared for such a proceeding, sat for a moment in silent amazement, and then, becoming suddenly alive to a sense of my situation, rushed frantically after them. My speed was checked somewhat abruptly by a door at the end of the passage being violently slammed in my face, for which polite attention I was indebted to the philanthropy of the hindmost pupil, who thereby imposed upon me the agreeable task of feeling in the dark for a door-handle in an unknown locality. After fumbling for some time, in a state of the greatest bewilderment, I at length opened the

door, and beheld the interior of the "pupil's room," which, for the benefit of such of my readers as may never have seen the like, I will now endeavour shortly to describe.

The parlour devoted to the pupil's use was of a good size, and nearly square, and, like the cabin of a certain "ould Irish gentleman," appeared to be fitted up with "nothing at all for show." In three of the corners stood small tables covered with books and writing materials, for the use of Dr. Mildman and the two senior pupils; in the fourth was a book-case. The centre of the room was occupied by a large square table, the common property of the other pupils; while a carpet, "a little the worse for wear," and sundry veteran chairs, rather crazy from the treatment to which many generations of pupils had subjected them, (a chair being the favourite projectile in the event of a *shindy*), completed the catalogue. Mr. Richard Cumberland, the senior pupil, was lounging in an easy attitude on one side of the fireplace; on the other stood, bolt upright, a lad rather older than myself, with a long unmeaning face, and a set of arms and legs which appeared not to belong to one another. This worthy, as I soon learned, responded to the name of Nathaniel Mullins, and usually served as the butt of the party, in the absence of newer or worthier game. Exactly in front of the fire, with his coat tails under his arms, and his legs extended like a pair of compasses, was stationed Mr. George Lawless, who, after being expelled from one of the upper forms at Eton, for some heroic exploit, which the head master could not be persuaded to view in its proper light, was sent to vegetate for a year or two at Dr. Mildman's, ere he proceeded to one of the universities. This gentleman was of rather a short thick-set figure, with a large head, and an expression of countenance resembling that of a bull when the animal "means mischief," and was supposed by his friends to be more thoroughly "wide awake" than any one of his years in the three kingdoms. The quartette was completed by Mr. Frederick Coleman, a small lad, with a round merry face, who was perched on the back of a chair, with his feet resting on the hob, and his person so disposed as effectually to screen every ray of fire from Nathaniel Mullins. "You are not cold, Fairleigh? Don't let me keep the fire from you," said Lawless, without, however, showing the slightest intention of moving. "Not very, thank you." "Oh! quite right—glad to hear it; it's Mildman's wish that, during the first half, no pupil should come on the hearth-rug. I made a point of conscience of it myself when I first came. The Spartans, you know, never allowed their little boys to do so, and even the Athenians, a much more luxurious people, always had their pinafores made of asbestos, or some such fire-proof stuff. You are well read in Walker's History of Greece, I hope?" I replied, that I was afraid I was not. "Never read 'Hookeyus Magnus?' Your father ought to be ashamed of himself for neglecting you so. You are aware, I suppose, that the Greeks had a different sort of fire to what we burn now-a-days? You've heard of Greek fire?" I answered that I had, but did not exactly understand what it meant. "Not know that, either? disgraceful! Well, it was a kind of way they had of flaring up in those times, a sort of 'light of other days,' which enabled them to give their friends a warm reception; so much so, indeed, that their friends found it too warm sometimes, and latterly they usually reserved it for their enemies. Mind you remember all this, for it is one of the first things old Sam will be sure to ask you." Did my ears deceive me? Could he have called the tutor, the dreaded tutor, "old Sam?" I trembled as I stood—plain, unhonoured "Sam," as though he had spoken of a footman? The room turned round with me. Alas! for Sandford and Merton, and affectionate and respectful esteem! "But how's this?" continued Lawless, "we have forgotten to introduce you in form to your companions, and to enter your name in the books of the establishment; why, Cumberland, what were you think-

ing off!" "Beg pardon," rejoined Cumberland, "I really was so buried in thought, trying to solve that problem about bisecting the Siamese twins, and extracting the square roots of their back teeth,—you know it, Lawless! However, it is not too late, is it? Allow me to introduce you, Mr. Fairleigh,"—"legh, sir," interrupted I. "Ah, exactly; well, then, Mr. Fairleigh, let me introduce this gentleman, Mr. George Lawless, who has, if I mistake not, been already trying, with his usual benevolence, to supply a few of your deficiencies; he is, if he will allow me to say so, one of the most rising young men of his generation, one of the firmest props of the glorious edifice of our rights and privilege." "A regular brick," interposed Coleman. "Hold your tongue, Freddy; little boys should be seen and not heard, as Tacitus tells us," said Cumberland, reprovingly. The only reply to this, if reply it could be called, was something which sounded to me like a muttered reference to the Greek historian Walker, whom Lawless had so lately mentioned; and Cumberland continued, "You will pay great attention to every thing Lawless tells you, and endeavour to improve by following his example, at a respectful distance—ahem! The gentleman on your right hand, Mr. Mullins, who is chiefly remarkable for looking ('like a fool' put in Coleman, *sotto voce*,) before he leaps, so long, that in general he postpones leaping altogether, and is in the habit of making ('an ass of himself,' said Coleman)—really, Freddy, I am surprised at you,—of making two bites at a cherry—you will be better able to appreciate when you know more of him. As to my young friend Freddy, here, his naturally good abilities and amiable temper ('Draw it mild, old fellow' interrupted the young gentleman in question,) have interested us so much in his favour, that we cannot but view with regret a habit he has of late fallen into, of turning every thing into ridicule, ('What a pity!' from the same individual,) and a lamentable addiction to the use of slang terms. Let me hope his association with such a polished young gentleman as Mr. Fairleigh may improve him in these particulars." "Who drank Mildman's ale at dinner?" asked Coleman; "if that's a specimen of his polished manners, I think mine take the shine out of them, rather." "I assure you," interrupted I, cagerly, "I never was more distressed in my life; it was quite a mistake." "Pretty good mistake,—Hodgson's pale ale for Muddytub's swipes,—eh, Mull?" rejoined Coleman. "Prime," replied Mullins. "Well, now for entering your name; that's important, you know," said Lawless; "you had better ring the bell, and tell Thomas to bring the books." I obeyed, and when Thomas made his appearance, informed him of my desire to enter my name in the books of the establishment, which I begged he would bring for that purpose. A look of bewilderment which came over his face on hearing my request, changed to an expression of intelligence, as, after receiving some masonic sign from Lawless, he replied, "The books, sir? yes, sir; bring 'em directly, sir." After a few minutes he returned with two small, not over clean, books, ruled with blue lines; one of these Lawless took from him, opened with much ceremony, and, covering the upper part of the page with a bit of blotting paper, pointed to a line, and desired me to write my name and age, as well as the date of my arrival, upon it. The same ceremony was repeated with the second. "That's all right: now let's see how it reads," said he, and, removing the blotting paper, read as follows:—"Pair of Wellingtons, 1*l*. 15*s*.; satin stock, 25*s*.; cap ribbon for Sally Duster, 2*s*. 6*d*.; box of cigars, 1*l*. 18*s*. (mem. shocking bad lot)—Nov. 5*th*, Francis Fairleigh, aged 16."—So much for that; now let's see the next:—"Five shirts, four pair of stockings, six pocket handkerchiefs, two pairs of white ducks.—Nov. 5*th*, Francis Fairleigh, aged 16." Here his voice was drowned in a roar of laughter from the whole party assembled, Thomas included, during which the true state of the case dawned upon me, viz.—that I had,

with much pomp and ceremony, entered my name, age, and the date of my arrival, in Mr. George Lawless's private account and washing books!

My thoughts, as I laid my aching head upon my pillow that night, were not of the most enviable nature. Leaving for the first time the home where I had lived from childhood, and in which I had met with affection and kindness from all around me, had been a trial under which my fortitude would most assuredly have given way, but for the brilliant picture my imagination had very obligingly sketched of the "happy family," of which I was about to become a member; in the foreground of which stood a group of fellow pupils, a united brotherhood of congenial souls, containing three bosom friends at the very least, anxiously awaiting my arrival, with outstretched arms of welcome. Now, however, this last hope had failed me; for, innocent (or, as Coleman would have termed it, *green*) as I then was, I could not but perceive, that the mock tone of politeness assumed towards me by Cumberland and Lawless was merely a convenient cloak for impertinence, which could be thrown aside at any moment when a more open display of their powers of tormenting should seem advisable. In fact, (though I was little aware of the pleasures in store for me,) I had already seen enough to prove that the life of a private pupil was not exactly "all my fancy painted it;" and, as the misery of leaving those I loved proved in its "sad reality" a much more serious affair than I had imagined, the result of my cogitations was that I was a very unhappy boy, (I did not feel the smallest inclination to boast myself *man* at that moment,) and that, if something very much to my advantage did not turn up in the course of the next twenty-four hours, my friends would have the melancholy satisfaction of depositing a broken heart, (which, on the principle of the Kilkenny cats, was all I expected would remain of me by that time,) in an early grave. Here my feelings becoming too many for me at the thought of my own funeral, I fairly gave up the struggle, and, bursting into a flood of tears, cried myself to sleep, like a child.

E. S.

THE DAIRIES OF HOLSTEIN.

HOLSTEIN butter is said to be (with the exception of that made in Holland proper) the best in the world; and it may not be uninteresting to our readers to describe the process adopted in that duchy for making this valuable article.

The duchy of Holstein, together with the duchies of Schleswig and Lauenburg, lies in a favourable position for commerce, being bounded by the Elbe and the German Ocean on the West, and by the Baltic on the East, while a ship canal unites the two seas. The climate is temperate, inclining to moisture: it does not materially differ from that of the midland counties of England, except that the cold is more steady and severe in winter, while the summers are warmer and drier. The night-frosts of April and May are the most unfavourable circumstance affecting the interests of agriculture; they are more felt than in England, because the heat of the sun in day time is greater, and the contrast, therefore, the more prejudicial. The soil is rich, and often receives accessions from the depositions of the river Elbe, and other sources.

The peculiarities of management in the Holstein dairy system relate to the buildings and utensils; to the time of milking, and number of hands employed; to the management of the milk; and to the mode of working, salting, and packing the butter. These have been described by Mr. Carr, in a communication to the

Royal Agricultural Society, and may be thus shortly stated.

The buildings on a large dairy are, a milk cellar, a butter cellar, a churning house, with a horse-mill adjoining, a cheese room, and a kitchen in which the utensils are washed, and food is cooked for all the persons immediately engaged in dairy work; to which are sometimes added their sleeping and eating apartments. The size and situation of the milk cellar are esteemed of great importance: it fronts the north, and is shaded from the southern sun by rows of trees, the elder being especially chosen, and planted as near the windows as possible, on account of the influence of that tree in keeping off insects. A thatched projecting roof affords protection from the heat, and great care is taken in choosing the site of a dairy, to place it out of the reach of anything which might taint the atmosphere. The size of the milk cellar is regulated by the number of cows, but it is generally calculated to contain the produce of four milkings. The milk dishes are always placed on the floor, and usually occupy a space of two feet square each; thus the produce of one hundred cows, giving, on an average, eight quarts per day, would fill fifty milk dishes at each milking, and would require a ground surface of 500 square feet, as there must unavoidably be spaces left to enable the dairy maids to go through their various operations. The floor is sometimes flagged, but oftener of brick, neatly fitted, so that no water may lodge in the joints; and always gently inclined, with a grating at the lower end, to facilitate the washing of the floor, which is never omitted to be done twice a day, notwithstanding that every source of impurity is guarded against, and every drop that may fall at the time of the milk being strained, is carefully wiped up. A recent improvement is the dividing the floor into compartments with brick ledges, from three to four inches high, between which the milk dishes stand. The lower extremity of these compartments is fitted with a small sluice, and twice a day they are filled with cold water from a pump. Thus the milk is preserved so cool as to prevent all approach to acidity for several hours longer than when placed on a dry floor. In sultry weather, a piece of pure ice is sometimes dropped into each milk pan, or a pailful of ice is placed in the dairy, which, by absorbing the heat, sensibly lowers the atmospheric temperature.

The best milk cellars are sunk from three to four feet in the ground; they are from sixteen to eighteen feet high, with an arched roof, and two rows of windows, looking north, east, and west, to secure a thorough air. The lower range of windows consists of wooden trellis-work, provided inside with gauze frames, to exclude insects, and outside with hanging shutters which can be lowered and elevated at pleasure. The upper range is furnished with glass sashes, which are exchanged for gauze frames when greater coolness is needed.

The butter cellar also is light, airy, and cool: it is likewise sunk in the ground, and supplied by the same means as the milk cellar with plenty of pure air. Here the butter, when carried from the churning house, is worked, salted, and packed. The filled butter-casks are ranged on clean boards, a little elevated from the floor, to allow of a free passage of air, and are turned and wiped every week.

Next in order comes the churning house, which has much the same arrangements as we find common in England. Of late years the perpendicular movement

of the churn-staff has been exchanged for the rotatory, which is found to churn in a shorter time, and with less risk of *oiling* the butter. The cheese room, in these dairies, is placed as far as possible from both the milk and the butter cellars.

The persons required to conduct the business of the dairy are, an overseer, a cooper, one or two cowherds, one or more swineherds, an upper dairywoman, and dairymaids in the proportion of one to every eighteen cows. The overseer takes care of the cattle, and is expected to know their diseases and the remedies. He is responsible for the conduct of the swineherd and cowherd, and superintends the fattening and rearing of calves. He also sees that the milking is thoroughly performed. When the number of cows does not exceed a hundred, he also undertakes the cooper's work, but, in large dairies, a cooper is kept in addition, who, besides his particular duties, assists in carrying the milk, feeding the cows when housed, &c. The wages of these two persons vary with the extent of the dairy, but may be averaged at sixty dollars for the first, and forty for the second, per annum.

The dairymaids, besides milking, cleaning the vessels, &c., work in the garden in summer, spin in winter, and wash, bake, brew, and cook, for the establishment, under the direction of the upper dairywoman, who is by far the most important personage therein, as on her skill, attention, and diligence, depend, in great measure, both the quantity and quality of the product. She must not only thoroughly understand, but accurately observe, the moment when the milk should be creamed; the degree of acidity it must attain in the cream-barrels; its temperature, whether requiring the addition of warm or cold water to the churn, as well as the subsequent operations of kneading, beating, salting, and packing, the butter. She must be punctiliously clean in her person and work, and require the same cleanliness of her maidens. In large establishments, the upper woman has full employment without milking, and even requires assistance in her own department; but in smaller dairies she milks about ten cows. Her wages are from fifty-five to sixty dollars per annum, while her chief assistants receive twenty-two, and the rest eighteen dollars.

During summer, the dairy people of Holstein rise at three, or even two, in the morning, if the weather be very hot; for which exertion they are allowed two hours' sleep in the middle of the day. The milking is carried on in the field, generally commencing at four, and lasting two hours. Each girl marks her own cows, by tying a particular coloured ribbon round their tails; and in some places each milker carries a string, on which a knot is made for every cow that is milked, to prevent any from being forgotten. The fields are large, and often at a great distance from the dairy, but the milk is safely and easily transported, by means of a long, low, four-wheeled, one-horse wagon, in the side bars of which, strong iron hooks are inserted, at such distances, that the milk-pails, containing from thirty to forty quarts each, may swing free of each other, and these, though filled nearly to the brim, are prevented spilling by merely having thin pieces of wood, about the size of a dinner plate, floating on the surface. The milk, when brought to the dairy, is immediately strained through a hair sieve into the vessels placed to receive it. These vessels are of various materials; they may be of wood, earthenware, copper tinned, zinc, cast iron lined with a china-like composition, or glass.

In order to secure butter of a first-rate quality, the cream is removed from the milk before any acidity is perceptible, and it has been found that a cellar-temperature of from 60° to 62° Fahr. is the most favourable, allowing of a complete disengagement of the cream in thirty-six hours; whereas a greater degree of warmth, while it quickens the separation, still more hastens the souring process, which injures both the quantity and quality of the butter. In a cold temperature the sepa-

ration is effected much more slowly, so that forty-eight, or even sixty hours may be required; this, however, is the longest period which can be given without the risk of imparting a rank unpleasant flavour to the butter. The first signs of acidity in milk are a very slight wrinkling of the cream, and a scarcely perceptible acid taste. The moment this is observed, the skimming begins, even if the milk have stood but twenty-four hours. The cream is poured through a hair sieve (which is kept for this purpose, and never employed in straining the new milk) into large barrels, containing about two hundred and forty quarts each, in which it remains until it is sufficiently sour, being stirred at intervals to prevent its becoming *cheesy*. The next object of the dairywoman's skill is the degree of warmth or coolness which must be imparted in order to secure good butter. In warm weather the churn is rinsed with the coldest water, in which a piece of pure ice is often thrown, and sometimes, though more rarely, cold spring-water is added to the cream about to be churned, which operation is then always performed either very early in the morning, or late in the evening. In cold weather, on the contrary, warm water is applied both to rinsing the churn, and to the cream itself.

The churning being completed, the butter is taken off by means of a large wooden ladle, and carried in a tub directly to the butter cellar, where it is cast into a large trough, hollowed out of the trunk of an oak or beech, very smoothly polished inside, and provided with a plug-hole at the lower extremity, beneath which a small tub is placed to receive the expressed milk. There the butter is slightly worked, and salted with the purest salt; then moulded with a wooden ladle into a mass at the upper end of the trough, and left for some hours to soak and drain. In the evening it is thoroughly kneaded and beaten, or rather slapped, the dairy maid repeatedly lifting a piece of from three to four pounds, and slapping it with force against the trough, so as to beat out all the milky particles; and thus lump after lump being freed from extraneous matter, the whole mass is spread out, receives its full proportion of salt, about an ounce and one-eighth per pound, which is worked with the utmost care equally through it, and again moulded into one compact mass. The butter in Holstein is scarcely ever washed, as water is believed to rob it of its richness and flavour, and to be unfavourable to its preservation.

When a quantity is ready sufficient to fill a cask, the several churnings are once more kneaded through, a very little fresh salt added, and the butter is packed in a barrel made of red beech wood, water-tight, which has been prepared by careful washing, and rubbing on the inside with salt. Great care is taken that no space shall be left either between the layers of butter, or the sides of the cask. In large dairies a cask is never begun to be filled until it can be completed, as thus alone the butter can be exactly of the same flavour and colour throughout.

The qualities of the excellent butter on which the Holsteiner so much prides himself, are, *first*, a fine even yellow colour, neither pale nor orange tinted; *secondly*, a close waxy texture, in which extremely minute and perfectly transparent beads of brine are perceptible; but if these drops be either large, or in the slightest degree tinged with milk colour, it is considered as marking an imperfect working of the butter, while an entirely dry tallowy appearance is equally disapproved; *thirdly*, a fresh fragrant perfume, and a sweet kernelly taste; *fourthly*, the quality of keeping for a considerable time without acquiring an old or rancid flavour.

There are four classes or varieties of butter known in Holstein. These are named *fresh-milk*; *May*, *Summer*, and *stubble* butter, according to the season in which each is produced. The fresh-milk butter is that made in spring, between the time when the cows calve and their being turned out to pasture. The May butter is that produced in May, after the cows have been sent to

grass. This is highly prized for its peculiarly fine aroma when fresh, but is found not to keep well, and therefore, like the fresh-milk butter, is generally sent to market as it is made. The summer butter is made in June and July, and from that time until the cows are removed from pasture, the butter bears the name of *stubble* butter. Both these latter sorts, if properly made, keep well, and retain their fine flavour nearly unimpaired until the following spring. The small quantity produced between the time of the cows being housed and becoming dry, is called *old milk* butter, and is least of all esteemed.

In winter, when the cows are confined to dry food, and the butter loses its fine yellow colour, artificial means are employed to remedy the defect; for the Holstein merchants find, that without the usual degree of colouring, their butter will not in some markets, (as in Spain and Portugal,) fetch its accustomed price. The ingredients used for this purpose are a mixture of annatto and turmeric, in the proportion of five ounces of the latter to one pound of the former. These ingredients are boiled in butter for half an hour, stirring them frequently, and then straining through linen; the preparation can then be kept for use. When butter is to be coloured, a portion of this mixture is melted over the fire: it is then poured into a hollow made in the mass of fresh churned butter, and by rapid stirring is intimately united with the butter immediately in contact with it, which being then spread over the whole mass, is, together with the requisite proportion of salt, carefully kneaded and worked through until no particle remains more highly coloured than another; and when smaller portions have thus been coloured from day to day, before a cask can be filled, the whole must, before packing, be kneaded once more, that no disparity of shade may disfigure it.

The greater portion of the butter made in the dairies of Holstein and Schleswig, is bought up by the Hamburg merchants, though it is likewise sent in considerable quantities from Kiel and other parts to England, Copenhagen, and the West Indies.

We have already noticed the importance attached to every particular relating to the milk cellar, and the utensils employed in making this celebrated butter. The different materials used for milk pans were named, and we may now give some further notices from the same authority on this head.

Various kinds of utensils have been tried in Holstein, in the hope of discovering how, in hot weather, more especially when a thunder storm is gathering, the milk can be kept from too early an acidity. Those in most general use are shallow wooden vessels, nearly of an equal diameter at top and bottom, containing, when full, about eight quarts, but in which, during summer, seldom more than six quarts are poured. The chief disadvantage of these vessels is the great labour and attention required to remove all acidity, which, in some states of the atmosphere, is almost unavoidable, and which, penetrating the pores of the wood, sometimes resists all the patient scrubbing, first, with hot water and small birch scrubbers, and secondly, with boiling water, and a hard round brush made of pig's bristles, with which every part of the utensil is carefully polished over. Sometimes the dairymaid is compelled to resort to washing in a ley of wood-ashes, or boiling, or even scorching over lighted chips, followed by countless rinsings in pure spring water. To diminish this labour, the milk-vendors in towns paint the milking pails and dishes with a preparation of cinnabar, linseed-oil, and litharge; but this is expensive, for the vessels require three coats of the composition at first, and one yearly afterwards, and, after all, the milk, for some days after these vessels are brought into use, has a perceptible taste of paint. Tinned copper milk-pans are very costly, and require careful watching, lest they should require re-tinning. The zinc pans are yet but little known, and their value not sufficiently proved. Cast

iron, lined with enamel, are durable and very clean, but too expensive. Glass-pans have many opponents on account of their brittleness. The testimony of Mr. Carr, however, is decidedly in favour of this material. He says, that in his dairy (which is supplied by 180 cows) the glass vessels have been used for four years. They are sixteen inches broad at the top, and twelve at the bottom: the glass is dark bottle green, transparent, and perfectly smooth, about one eighth of an inch thick, and furnished with a round rim at the upper edge, which makes it easy to retain a safe hold of them even when full. They would contain eight quarts, but never receive more than six. "They cost eight-pence a-piece, and their durability may be estimated by the fact that, to encourage carefulness, each dairy maid is allowed one dollar extra, as *pan-money*, being bound at the same time to pay ten-pence for each one she breaks; yet hitherto," says Mr. Carr, "no girl has broken to the extent of her dollar." The great advantage of these vessels is in the saving of time, fuel, and labour they effect, for they merely require to be washed in luke-warm water, then rinsed in cold water, and put in a rack to dry. Supposing, therefore, (which Mr. Carr does not admit,) that the milk, during a few weeks in summer, becomes sour sooner, and consequently throws up less cream, in glass than in wood, this disadvantage would be more than counterbalanced by the diminished expenditure of glass vessels, for, of course, where time and labour are saved, the number of domestics may be lessened.¹

Cow-houses in Holstein are generally twice as long as broad, and calculated for four cows lengthways, standing head to head, with passages between, floored with brick, and furnished with feeding and drinking troughs. One passage, if not both, is broad enough to admit a loaded hay-wagon, and is provided with large folding doors at each end, while there is also room behind the cattle sufficient to permit the manure being sledged out with a horse, without incommoding them. The lofty roof affords accommodation for hay and straw, which helps to keep the house warm in winter; the doors are kept shut as much as possible during that season, sufficient light being admitted by small glazed windows. The quantity of food which can be afforded to the cows during winter, is ascertained as soon as the harvest returns are known. In plentiful seasons the calculation is, that each cow should be allowed three sacks of grain, (generally oats, of 140lb. each sack,) 3,900lbs. of straw, including bedding, and 1,800lbs. of good hay; whilst for every hundred pounds of hay less, she receives twenty-five pounds of grain more, or *vice versa*.

There are three distinct breeds of cattle in the duchies, the native cow, the marsh cow, and the Jutland cow. The first is middle-sized, with fine head and horns, and moderately thick neck; the colour generally red or brown, though often yellow, black, or spotted. The district of Angeln produces the finest specimens of these cows, which are considered to yield more milk in proportion to the food they require, than any other kind. The marsh cows are large-boned, generally red, and requiring luxuriant pasture. They thrive well in the marshy delta of the Elbe, giving, when in full-milk, from twenty-four to thirty-two, or even forty quarts of milk daily; but the return of butter is much smaller and of inferior quality to that of the Angeln cattle. The Jutland cow is fine in bone, rather lengthy than deep in body; but not generally long-legged. The usual colours are grey, dun, or black, or either of these spotted with white. They are distinguished for fattening easily, and are not much prized for dairy purposes.

The average quantity of milk obtained from good stock is estimated at from 2,000 to 3,000 quarts per annum, according to the food and care bestowed on the

cows. The produce has been calculated thus—every 100 lbs. of milk will give $8\frac{1}{2}$ lbs. of butter, 6 lbs. of fresh cheese, 14 lbs. of butter-milk, (exclusive of the water added before and after churning,) and 76 lbs. of whey; and though the different circumstances affecting the cows cause a great variety in the results, still it is considered a fair average that fifteen quarts of milk are required for a pound of butter; for although from some cows a pound may be obtained from twelve quarts; yet, others, and even the same cows at different seasons, and with different food, (such as beet, or raw potatoes,) will not produce a pound of butter from less than seventeen or eighteen quarts. On the whole, it is esteemed a fair return in these duchies, when the average produce of the dairy amounts to 100 lbs. of butter, and 150 lbs. of cheese, per cow.

The above particulars will, we doubt not, prove interesting to many of our readers, who may be concerned in the business of the dairy, and may, in some cases, supply a few hints of practical utility; for there is much to admire, and something to copy, in the numerous precautions taken by the Holstein dairy-farmer, to insure an article of first-rate excellence as the product of his industry.

THE HOLY CITY.¹

[First Notice.]

Rest of thy sons, amid thy foes forlorn,
Mourn, widowed queen! forgotten Sion, mourn!
Is this thy place? sad city! this thy throne,
Where the wild desert rears its craggy stone,
While suns unblest their angry lustre fling,
And way-worn pilgrims seek the scanty spring?
Where now thy pomp, which kings with envy viewed?
Where now thy might, which all those kings subdued?
No martial myriads muster in thy gate;
No suppliant nations in thy temple wait;
No prophet-bards, thy glittering courts among,
Wake the full lyre, and swell the tide of song:
But lawless force, and meagre want are there,
And the quick darting eye of restless fear;
While cold Oblivion, 'mid thy ruins laid,
Folds his dark wing beneath the ivy shade.

BISHOP HEBER.

No other city in the world possesses such remarkable claims on our attention as Jerusalem. Its unequalled antiquity, dimly appearing in the uncertainty of very early tradition; its eventful history in all ages; and its having so long been the scene of contention between Christian and infidel states; the prominent place it occupies in the sacred writings, as the Mountain of the Lord's House, where his glory visibly appeared; and the fact of its having been the scene of the ministry, death, and resurrection of our blessed Lord; these, and a hundred other unequalled claims, give to the Holy City an overwhelming importance, and invest it with an unrivalled sanctity.

The early history of Jerusalem is lost in the obscure mist of very remote ages. Some names of high authority support the testimony of Josephus—who probably represented the tradition of the Jewish church—that

(1) "The Holy City, or Historical and Topographical Notices of Jerusalem, with some account of its Antiquities, and of its present Condition. By the Rev. George Williams, M.A., Fellow of King's College, Cambridge, and late Chaplain to Bishop Alexander, at Jerusalem. With illustrations, from sketches by the Rev. W. F. Witts, B.A., Fellow of King's College, Cambridge." London: John W. Parker. 8vo. 1845.

(1) The recent liberation of glass from all duty, now affords manufacturers an opportunity of supplying our dairy farms with milk-pans made of that beautiful material.

the Salem of Melchizedec is identical with the Jerusalem of which David was the second founder. Nothing, however, is known of its origin, nor are writers agreed as to where it is first mentioned in holy Scripture. If the Jewish historian is correct in ascribing its foundation to Melchizedec, then may the Holy City boast of greater antiquity than any city in the world, and of a founder worthy of its future celebrity.

Jerusalem is not named by that title in Scripture until the time arrived for the fulfilment of the promise to Abraham, when the Israelites, under the command of Joshua, entered upon the possession of their inheritance. The decisive victory obtained by Joshua over the combined army was obtained on a plain distant about an hour from Jerusalem, and to the east of it. The king of Jerusalem, with his four allies, was taken and put to death; but we do not read that his city, like theirs, fell into the hands of the conquerors at this time. It was reserved for David to bring it under complete subjection. No sooner had he come into the undisputed sovereignty of the whole land, than he went to Jerusalem, and took the castle of Zion out of the hands of the Jebusites. This fortress came now to be called "The City of David." He took up his abode in the castle, and enlarged the city to a size worthy of the dignity of a royal city, and of the seat of government.

It is remarkable that in no part of canonical Scripture is any mention made of the fate of that most sacred object of veneration—the ark of the covenant, with its holy contents. Jewish tradition informs us that it had no place in the second temple; but its fate is nowhere recorded on any certain authority. The prevailing belief of the late Jewish church has been, that it is miraculously preserved in a secret chamber of most difficult access, in the sacred rock within the great mosque at Jerusalem, where it was deposited by King Josiah. But the chroniclers of the Crusades incline rather to the account referred to in the second book of the Maccabees, by which it is said to be securely hidden in a cave under Mount Nebo.

It was a wise caution, and worthy of imitation, which withheld an old historian of the church from commenting on the events connected with the early ministry of our blessed Lord, and those first years of the Christian church, of which it has pleased the divine Spirit to dictate an inspired history, lest the defects of a human narrative should detract from the dignity of actions which have been judged worthy of such a record. Eusebius informs us that the church at Jerusalem, from the period of its establishment to the time of the Emperor Adrian, was governed by fifteen bishops in succession, the first of whom was St. James the Just, the brother of our Lord, one of the Twelve, and the writer of that Catholic epistle which bears his name.

The return of the Christians to Jerusalem is placed by all the ancient authorities immediately after its destruction by Titus. The church maintained its virgin purity until the presidency of Justus, who succeeded St. Simeon, when it became tainted with heretical pravity. From this period to the reign of Adrian the records are very scanty; when the Jews were forbidden all access to the Holy City, which was again desecrated by the Romans. It was subsequently adorned with churches, and rendered illustrious as a Christian capital. Now occurred the important events of the recovery of the Holy Sepulchre of our Lord, and the erection of the Basilica of the Resurrection. Julian the Apostate encouraged the Jews to rebuild the temple, but by a miraculous interference they were prevented: fearful balls of fire broke forth with irresistible violence from near the foundations, scorched the workmen, and drove them from the place. In the seventh century Jerusalem was taken by Chosroes, king of Persia, when several of the churches, and part of the city, were destroyed. The sacred buildings having been restored, the Christian emperor Heraclius repaired in person to Jerusalem, carrying with him, according to Mr. Williams' narra-

tive, the true cross; the seals of the chest in which it was contained having continued unbroken during the Captivity. On the 14th of September, A.D. 629, a day still marked in the English calendar, and whose anniversary is celebrated with especial solemnity in other churches of the west and east, Heraclius, having laid aside his royal apparel, entered the Holy City clothed in mean garments, and barefoot, carrying on his shoulder the wood on which he supposed the redemption of the world had been accomplished.

It was during this century that the Arabian prophet arose, whose victorious arms soon subdued so many fair and fertile provinces. Jerusalem was besieged by his followers; but the patriarch refused to treat with any but the Khalif himself. Omar accordingly repaired to the Holy City; and they concluded articles of capitulation, remarkably favourable for the Christians. From this period they enjoyed peace and protection, until the accession to power of the family of Abbas, when they suffered from the caprice of that tyrannical and bloody house.

In the year 1094, Peter, a French hermit, came as a pilgrim to the Holy City; and his sympathy was awakened by the sufferings of the native church. He witnessed with righteous indignation the flagitious practices of its ruthless oppressors, who exposed them to insults in their holy places, and profaned their churches, and the sacred vessels, and the altars. Peter the Hermit resolved on rousing the western part of Christendom. The cause was strenuously taken up by Pope Urban II. The watch-word—claiming the Divine sanction for the undertaking—*Deus vult*, ran like wildfire through the countries of the west; and Europe was convulsed to its centre with preparations for the Holy War. Italy, France, and Germany, sent forth their willing thousands on this first Crusade; and the mighty hosts assembled under the command of their Christian princes and generals. Inspired by an enthusiasm which shrunk from no danger, the gallant army crossed the barren plain, the broad river, the rocky mountain, and the sandy desert, until the remnant that had escaped the perils of the way sat down under the walls of the Holy City, June 7, 1099.

They soon found, to their dismay, that all their efforts would be fruitless without the aid of machines. Trees were felled at a distance of six or seven miles from the city, and conveyed on camels. All distinctions of rank were forgotten: high and low, rich and poor, emulated each other. Exposed to the oppressive heat of a Syrian sun, beneath which they toiled incessantly, the Christian host underwent enormous suffering. To the horrors of drought, infection was shortly added, as many of the cattle had died for want of pasture. Having, after some weeks of arduous toil, completed their preparations, the day was fixed for the assault, and it was resolved to spend some time in the most solemn religious services, to bring down upon them the blessing of the Lord of Hosts. A procession of barefooted clergy was formed, who chanted solemn litanies; and proceeding to the Mount of Olives, their zeal was stimulated by sermons from Peter the Hermit and Anselmus.

At the dawn of day the soldiers of the Cross commenced the assault. Animated by a like spirit, they proposed to themselves one of two alternatives—victory or martyrdom. Even the aged and the sick, the women and children, took part in the fight. Night parted the combatants, which gave place to the dawn of the memorable 15th of July, when the battle was again renewed. But, after seven hours' hard fighting, the courage of the weary and dispirited besiegers began to flag, when a timely apparition on Mount Olivet, said to have been distinctly seen by the Christian princes, Duke Godfrey and his brother Eustachius, revived the dying embers of zeal. The outworks were soon carried; and the valiant brothers, at the head of a chosen band, carried the wall, when the besieged flew in all directions. The

northern gates were opened, and the Crusaders were masters of Jerusalem. It was on a Friday afternoon, at three o'clock, that the Holy City was taken; and the chroniclers do not fail to remark, that it seemed divinely ordered that at the very hour, and on the same day of the week, on which our Lord suffered, His followers were permitted to see the consummation of their wishes, in their triumph over His enemies.

How strange and unaccountable it appears that the soldiers of the Cross—who, before commencing the siege, had sought in humiliation and penitence the blessing of the Almighty, and besought Him to go forth with their hosts—should now, flushed with victory, and thirsting for blood, commit the most frightful and inhuman carnage! The transition in the events of this day, fills, perhaps, the most striking page in the history of enthusiasm. Having wearied themselves with slaughter, they laid aside their weapons, washed their blood-stained hands, and changed their garments;—then, with bare feet, and the most striking outward indications of humble spirit and contrite heart, and singing hymns of praise, they proceeded to the venerable places which their Saviour had deigned to adorn and sanctify by His presence. Fain would we close the scene here; but a darker tragedy of cold-blooded butchery was enacted three days after the capture of the city; when the surviving Moslems were most barbarously slaughtered in violation of the treaty.

The first act of the assembled princes, after the burial of the dead and the purification of the city, was the election of a king; and the personal merits and important services of Godfrey, Duke of Lorraine, were not forgotten nor unrewarded. But the history of the Frank kingdom in Palestine can only be slightly glanced at. Its kings found their office one of great difficulty. The helmet was their crown, the coat-of-mail their robe of state, the heavens their royal canopy, and the saddle of the war-horse their throne. They extended their arms beyond the limits of the Holy Land. Only the warrior monks of the Temple, and the Knights of the Hospital of St. John, maintained their devotion to the Holy Sepulchre unimpaired, and earned for themselves a deathless fame.

Eighty-eight years after the conquest of the Crusaders, the green and yellow banners of the Moslems were unfurled before the walls of Jerusalem, at the hour of evening prayer. Again was the Holy City wrested from the Christians; again did the Mohammedan banners flaunt over its towers and battlements. The whole of Christendom was dismayed at the fall of Jerusalem, while the infidels rejoiced over the humbled Christians, and dragged, in dishonour, a golden cross through the streets. The subsequent history of Jerusalem may be told in few words. The defenceless state of the phoenix-like city was the protection of its inhabitants from further molestation during the expiring struggles of the Crusaders, whose ruin was hastened by the conquests of the first Mamluk sultan of Egypt, and consummated by the fall of Acre before the victorious arms of Kelason. The historical importance of Jerusalem terminates with the expulsion of the Franks from the country. In 1542, the Ottoman sultan, Soleiman, erected the well-built walls round the city, which remain to this day. From this period, not a year has passed for three successive centuries, without disputes between the three principal Christian communities which divide the city. In 1808, the churches of the Resurrection and of the Holy Gethsemane, with the buildings connected with them, were destroyed by fire. The heat was so excessive, that the marble columns which surrounded the circular building, in the centre of which stood the Holy Grotto, were completely pulverized. The molten lead from the immense dome which covers the Holy Sepulchre, poured down in torrents; yet the Holy Cave itself received not the slightest injury, externally or internally; the silk hangings remained unscathed by the flames, the smell of fire not having passed upon them. The churches, &c.

were restored in the following year, after the original models, at an immense expense, chiefly borne by the Greek Christians.

Of late years, the Holy City has shared the fortunes of Syria; having passed into the possession of Ibrahim Pasha in 1832, it was restored to the Ottoman power, after the memorable bombardment of Acre, in November 1840. Formerly subject to the pashalic of Damascus, it has latterly enjoyed the distinction of a resident pasha; but its tranquillity is liable, at any moment, to be disturbed by the lawless sheiks of the country, whose violence Ibrahim Pasha was alone able to repress by the terrors of the sword. So low has she now fallen, who defied for months the arms of Imperial Rome!

POPULAR YEAR BOOK.

May.

THE "merry month of May" was the second in the old Alban Kalendar, the third in that of Romulus, and the fifth—the station it now holds—in the one instituted by Numa Pompilius. It consisted of twenty-two days in the Alban, and of thirty-one in Romulus's Kalendar; Numa deprived it of the odd day, which was restored by Julius Cæsar. Some imagine that May was so called from the heathen goddess, Maia, the mother of Mercury. Brady says, that "Romulus continued to this month the name of Maius, out of respect to the senate appointed to assist him when he was elected king, who were distinguished by the epithet *Majores*." The Romans deemed it to be under the protection of Apollo. In the middle age it was dedicated to St. Mary, "when men," writes Mr. Digby, "would devoutly repeat her office as they walked in some garden, bright with the sweet hue of eastern sapphire that was spread over the serene aspect of the pure air, at the rising of the sun, and beheld the swans majestically resting on the limpid waters."

Our Saxon forefathers termed it *Tri-milki*, because at this season "they began to milk their kine three times in the day." *Me*, an evident corruption of May, was the old Cornish name of this month. May was anciently represented as a beautiful youth, clothed in robes of white and green, embroidered with daffodils and hawthorn blossoms, his head crowned with white and damask roses, holding a lute in one hand, and bearing, on the fore finger of the other, a nightingale. Spenser sings:—

"Then came fair May, the fairest maid on ground,
Deck'd all with dainties of her season's pride,
And throwing flowers out of her lap around:
Upon two brethren's shoulders she did ride,
The twins of Leda; which on either side
Supported her, like to their sovereign Queen.
Lord! how all creatures laughed when her they spied,
And leap'd and danced as they had ravish'd been!
And Cupid self about her fluttered all in green."

There is an allusion in the above stanza to Castor and Pollux, or Gemini, into which sign the sun enters on the 20th of May. This month and its beauties have been a popular theme of poetical celebration; but in England, and particularly since we have reckoned by the new style, a great part of it is frequently yet too cold for a perfect enjoyment of nature's loveliness, and sometimes injury is done to the flowers and young fruits, during its course, by blights and chilling winds. A cold and windy May, however, is accounted favourable to the corn; and an old Scotch proverb says:

"A wet May and a winnie
Brings a fou stackyard and a finnie;"

implying that rain in this month, and dry winds afterwards, produce a plentiful crop, with that mark of excellence by which grain is usually judged of by connois-

seurs—a good feeling in the hand. There is another rhyme, which is not over flattering to the favourite month of the poets :

"Till May be out
Change na a clout."

That is, thin not your winter clothing till the end of May—"A good maxim," says Mr. Chambers, "if we are to put faith in the great father of modern medicine, Boerhaave, who, on being consulted as to the proper time for putting off flannel, is said to have answered, "On Midsummer night, and put it on again next morning."

The latest summer birds of passage, the fern-owl, sedge and reed-warbler, spotted fly-catcher, field-lark, razor-bill, dobel, red-backed shrike, hobby, and land-rail, arrive about the beginning of this month. Most of our birds are hatching and rearing their young, and the males are in full song. The sulphur, peacock, tortoise-shell, and white cabbage butterflies are now on the wing; field-crickets, cock-chafers, grasshoppers, and glow-worms abound; and towards the end of May the bees send forth their early swarms. Fruit gardens now afford an agreeable though immature product in the young gooseberries and currants. Trees put on all their verdure. The lilac and hawthorn bloom. The flowers of the oak, chestnut, Scotch-fir, beech, hornbeam, holly, and alder trees, begin to open, and the orchards display all their charms in the delicate blush of the plum, cherry, pear, and apple blossoms. Meadows are thick with the bright young grass, "running into clouds of white and gold," with daisies and buttercups; the earth in woods is now shaded; and in dank and dark places is spread with yellow and blue patches of primroses; violets open among the mossy roots of old trees; lilies of the valley "nod their welcome to the little wren as she twitters upon pendant branches," and the orchis, the honeysuckle, germander, and columbine are in beauty. The hyacinth, standard tulip, laburnum, guelder rose, peony, wallflower, rhododendron, rocket, and stock, marygold, and anemone, bloom in the garden.

"All the earth is gay,
Land and sea
Give themselves up to jollity,
And with the heart of May,
Does every beast keep holiday."

About the 12th of this month, or old May-day, cows are turned out to pasture. Their milk soon becomes rich and copious, and cheese-making begins, particularly in Cheshire, Wiltshire, and Gloucestershire. Potatoes and cow-cabbage are planted; trees are barked and felled, and corn is weeded. Children gather cowslips for wine, and the gardener sows flower seeds, and weeds his borders. May is generally considered an unlucky time for the celebration of marriage. "This," says Brand, "is an idea which has been transmitted to us by our popish ancestors, and was borrowed by them from the ancients."

May 1.—Feast of St. Philip and St. James.

MAY-DAY.

The celebration of the first of May is one of the oldest customs in the world, having come down from the earliest ages of Paganism, through various channels. "It must have been prompted," says a recent journalist, "by nature herself. The time of the young flower and leaf, and of all the promise which August fulfils, could not but impress the minds of the simplest people, and dispose them to joyful demonstrations in word and act." The sun, as the immediate author of the glories of the season, was now worshipped by the Celtic nations under the name of Baal; hence the festival of Beltein, still faintly observed in Ireland and other places. The

people kindle fires on the tops of their mountains on May-day, called Beal fires. This practice is to be traced in the mountainous and uncultivated parts of Cumberland, amongst the Cheviots, and in many parts of Scotland. Pennant relates,—"On the first of May, in the highlands, the herdsmen of every district hold their Beltein. They cut a square trench in the ground, leaving the turf in the middle. On that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal, and milk, and bring, besides the ingredients of the caudle, plenty of beer and whisky, for each of the company must contribute something. The rite begins by spilling some of the caudle on the ground, by way of libation. On that, every one takes a cake of oatmeal, on which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them. Each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says—'This I give to thee, preserve thou my sheep; this I give to thee, preserve thou my horses;' and so on. After that they use the same ceremony to the noxious animals. 'This I give to thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, eagle!' When the ceremony is over they dine on the caudle." Even in Ayrshire they kindled Baal's fire on the evening of May-day, till about the year 1790.

The European observance of May-day is principally derived from the Romans, who have left traces of it in all the countries they subdued. It was their festival of Flora, at which there was great display of flowers, and where women danced, if we are to believe Juvenal, "only too enthusiastically."

We gather from authentic sources that the Saxon Eldermen, going at this season to their Wittenagemote, or Assembly of Wise Men, left their peasantry to a sort of saturnalia, in which they chose a king, who chose his queen. He wore an oaken, and she a hawthorn wreath; and together they gave laws to the rustic sports, during those sweet days of freedom. The May-pole too, or the Column of May, as it was then called, was the grand standard of justice amongst our ancestors, in the *ry-commons*, or fields of May, and the garland hung on its top was the grand signal for convening the people. Here it was that they deposed or punished their governors, their barons, and kings. The first of May was also considered the boundary day that divided the confines of winter and summer, in allusion to which there was instituted a "sportful war" between two parties; the one in defence of the continuance of winter, the other for bringing in the summer. The youth were divided into troops, the one in winter livery, the other in the gay habit of spring. The latter were always sure to obtain the victory, which they celebrated by carrying triumphantly green branches with May-flowers, singing a song of joy, of which the burthen was in these or equivalent terms:

"We have brought the summer home."

"In England," remarks a late writer, "we have to go back a couple of hundred years for the complete May-day; since then it has gradually declined, and now it is almost extinct." When it was fully observed, "the business of the day began with the day itself," that is to say, at midnight. Shakspeare, in his play of Henry VIII., mentions that it was impossible to make the

people sleep on May-morning. Immediately after twelve had struck they were all astir, wishing each other a merry May. They then repaired to some neighbouring wood, accompanied with music and the blowing of horns, where they broke down branches from the trees, and adorned them with nosegays and crowns of flowers. This done, they returned homewards about the time of sun-rise, and "made their doors and windows triumph in the flowery spoil."

In Herrick's "Hesperides" is the following allusion to this practice:—

"Come, my Corinna, come: and coming, mark
How each field turns a street, each street a park
Made green and trimmed with trees: see how
Devotion gives each house a bough,
Or branch: each porch, each door, ere this,
An ark, a tabernacle is,
Made up of white-thorn neatly interwove."

Stubbs, in the "Anatomie of Abuses," 1585, tells us, "Against May, every parish, town, and village, assemble themselves together, both men, and women, and children, old and young, even all indifferently: and either all going together, or dividing themselves into companies, they go, some to the woods and groves, some to the hills and mountains, some to one place, some to another, where they spend all the night in pastimes, and in the morning they return, bringing with them birch boughs, and branches of trees to deck their assemblies withal." Stow records of the citizens of London, that they "of all estates, lightly in every parish, or sometimes two or three parishes joining together, had their several Mayings, and did fetch in May-poles, with divers warlike shews, with good archers, morris-dancers, and other devices, for pastime all the day long, and towards the evening they had stage-plays and bonfires in the streets." In some places "the Mayers" brought home a garland suspended from a pole, round which they danced. In others there was an established May-pole for the village. "Their chiefest jewel," says Stubbs, "is their May-pole, which they bring home with great veneration, as thus:—they have twenty or forty yoke of oxen, every ox having a sweet nosegay of flowers tied on the tip of his horns; and these oxen draw home this May-pole, (this stinking idol, rather,) which is covered all over with flowers and herbs, wound round about with strings from the top to the bottom, and sometimes painted with variable colours, with two or three hundred men and women and children following it with great devotion; and thus being reared up with handkerchiefs and flags streaming on the top, they strew the ground about, bend green boughs about it, set up summer-halls, bowers, and arbours, hard by it. And then fall they to banquet and feast, and leap and dance about it, as the heathen people did at the dedication of their idols, whereof this is a perfect pattern, or rather the thing itself." The May-pole was often as tall as the mast of a sloop of fifty tons, and properly fixed in a frame to keep it upright. Once erected, it remained until nearly the end of the year, and was resorted to at all other seasons of festivity, as well as during May. Some even continued for years, being merely fresh ornamented, instead of being removed, as was the common practice. There were several throughout the city. Chaucer mentions the pole, or *shaft* in Leadenhall-street, higher than the steeple of the church of St. Andrew-under-shaft. Another, alluded to by Beaumont and Fletcher, stood nearly on the site of St. Mary-le-Strand. Its successor was taken down in 1717, and conveyed to Wanstead, in Essex, where it became the support of a large telescope, the property of the Royal Society. Its original height was upwards of one hundred feet above the surface of the ground. It had two gilt balls and a vane on the summit, and was deco-

rated on public occasions with streamers and garlands. Pope thus perpetuates its remembrance:—

"Amidst the area wide they took their stand,
Where the tall May-pole once o'erlooked the Strand."

"Besides the principal May-pole," says Brady, "others of less dimensions were likewise erected in our villages, to mark the place where refreshments were to be obtained; hence the name of ale-stake is frequently to be met with in old authors, as signifying a May-pole." The regular "May-games" appear to have been introduced about the beginning of the 15th century. It seems to have been a constant practice at their celebration, to elect a Lord and Lady of the May, who presided over the sports, and were decorated with scarfs, ribands, and other fineries. To the latter of these personages, a poem, published in 1625, contains the following allusion:—

"As I have seen the Lady of the May
Set in an arbour (on a holiday)
Built by the May-pole, where the jocund swains
Dance with their maidens to the bagpipe's strains."

It was customary also to personify that darling of England's yeomanry, Robin Hood, with several of his most noted associates: when this was the case, he presided as Lord of the May, and a female, or rather, perhaps, a boy attired like a female, called the Maid Marian, his faithful mistress, was the Lady of the May. His companions were distinguished by the title of "Robin Hood's men," and were also arrayed in appropriate dresses; their coats, hoods, and hose, were generally green. In the churchwardens' account for the parish of St. Helen's, Abingdon, Berks, dated 1566, is the following article:—"Paid for setting up Robin Hood's bower, eighteen-pence;" that is, a bower for the reception of the fictitious Robin Hood and his company, belonging to the May-day pageant. The fool, the dragon, and the hobby-horse, likewise formed part of the show. The last was a compound figure; the resemblance of the head and tail of a horse, with a light wooden frame for the body, was attached to the person who was to perform the double character, covered with trappings reaching to the ground, so as to conceal the feet of the actor, and prevent it being seen that the supposed steed had none. Thus equipped, he was to prance about, imitating the curvetings and motions of a horse. This worthy and the dragon are excellently figured in Nash's "Mansions of England in the olden time," first series, Plate XXV.; and their gambols, together with the entire manner in which a "May-game" was anciently performed, will be found fully described in Strutt's *Queenhoo Hall*. Such were the "festivities of youth and nature" in which our monarchs, especially Henry VIII., Elizabeth, and James, used to participate. In the reign of the "maiden Queen," pageant seemed to have arrived at its greatest height: and the May-day revelries were celebrated in their fullest manner, and so they continued, attracting the attention of the royal and noble, as well as vulgar, till the close of the reign of James I. In "The Progresses of Queen Elizabeth," is this entry:—"May 8th, 1602. On May-day, the Queen went a-Maying to Sir Richard Buckley's, at Lewisham, some three or four miles off Greenwich." It is recorded by Hall that, in the seventh year of Henry VIII., that prince made a grand procession, with his queen, and many lords and ladies, from Greenwich to Shooter's-hill: "when, as they passed by the way, they espied a company of tall yeomen, clothed all in green, with green hoods, and with bows and arrows, to the number of two hundred. One, being their chieftain, was called Robin Hood, who required the King and all his company to stay and see his men shoot: whereunto the King granting, Robin Hood whistled, and all the two hundred archers shot off, loosing all at once; and when he whistled again, they likewise shot again: their arrows whistled by craft of the head, so that the noise was strange and loud, which greatly delighted the King, Queen,

and their company." The royal retinue afterwards entered the "green wood," where, in arbours made with boughs, and decked with flowers, they were entertained by Robin and his men "to their great contentment, and had other pageants and pastimes." In Henry VI.'s time, the aldermen and sheriffs of London went to the Bishop of London's wood, in the parish of Stebenheath, and there had a worshipful dinner for themselves and other comers; and Lydgate, the poet, a monk of Bury, sent them, by a pursuivant, "a joyful commendation of that season, containing sixteen stanzas in metre royal."

May-poles and games were altogether suppressed during the Great Rebellion. In April, 1644, there was an ordinance of both Houses of Parliament "for taking down all and singular May-poles." At the Restoration these favourites of the populace, with all their jovial concomitants, were re-established. A May-pole, as we have remarked, remained in London until the beginning of the last century. About the same period, a learned foreigner relates that, "on the first of May, and the five and six days following, all the pretty young country girls that serve the town with milk, dress themselves up very neatly, and borrow abundance of silver plate, whereof they make a pyramid, which they adorn with ribands and flowers, and carry upon their heads, instead of their common milk-pails. In this "equipage," accompanied by some of their fellow milkmaids, and a bagpipe or fiddle, they go from door to door, dancing before the houses of their customers, in the midst of boys and girls that follow them in troops, and every one gives them something. "The Mayings," says Strutt, in his "Sports and Pastimes," published so recently as 1801, "are in some sort yet kept up by the milkmaids at London, who go about the streets with their garlands and music, dancing."

The milkmaids' "garland" of forty years ago, was a pyramidal frame, covered with damask, glittering on each side with polished silver plate, and adorned with knots of gay coloured ribands, and posies of fresh flowers, surmounted by a silver urn, or tankard. This "garland" being placed on a wooden frame, was carried by two men, sometimes preceded by a pipe and tabor, but more frequently by a fiddle; the gayest milkmaids followed the music, others the "garland," and they stopped at their customers' doors, and danced, as above related. The plate in some of the "garlands" was very costly. It was usually borrowed for the occasion of the pawnbrokers, upon security. It was customary for milk people of less profitable walks to make a display of another kind, less gaudy in appearance, but better bespeaking their occupation, and more appropriate to the festival. A beautiful country girl, more gaily attired than on any other day, with flowers in her hat and on her bosom, led her cow, by a rope depending from its horns, decorated with garlands and ribands; the horns, neck, and head of the animal were similarly ornamented; a fine net, like those upon ladies' palfries, tastefully stuck with flowers, covered the cow's back, and even its tail was adorned with "products of the spring," and silken knots. The proprietress of the cow followed on one side, in holiday array, with a sprig in her country bonnet, a nosegay in her handkerchief, and ribands on her stomacher. Even these faint shadows of the original sports of May-day have subsequently faded away in the metropolis, so that the green glories and flowery festivities of the season only survive, (if the grim show may not rather be deemed a posthumous pageant,) in the Saturnalia of the chimney-sweeping imps, "who," says Horace Smith, "with daubed visages, and bedizened in tinsel trumpery, hop around a faded Jack-in-the-green, to the dissonant clatter of their shovels and brushes."

(To be concluded in our next.)

Reading for the Young.

DRUIDICAL MONUMENTS.

IN no other part of England are there so many Druidical monuments remaining as in Devon and Cornwall. The discoveries which Mr. Bray has made among the rocks at Dartmoor warrant the assertion, that, perhaps, there was not a more celebrated station of Druidism than on Dartmoor; one reason for this being the facilities which the masses of granite, everywhere strewn throughout the moor, and the tors that crowned the summit of every hill, afforded for the purpose of their altars, circles, obelisks, and logans (or rocking stones).

On the plains of Salisbury nature had done nothing for the grandeur of Druidism, and art had to do all. The architects of Egypt, who planned the Pyramids, like the Druids of Stonehenge, had a level country to contend with, and they gave to it the glory of mountains, as far as art may be said to imitate nature in the effects of her most stupendous works. On Dartmoor, the priests of the Britons appropriated the tors themselves as temples, so that what in level countries became the most imposing object, was here considered as a matter of comparative indifference. In such scenes a Stonehenge would have dwindled, in comparison with the granite tors, into insignificance; it would have been as a pyramid at the foot of Snowdon. These tors are rocks which lie piled mass on mass in horizontal strata. They are mostly found on the summits of the hills.

Perhaps the most remarkable logan, or rocking-stone, is in Cornwall, on the top of a ledge of high rocks near the Land's End. Though from 80 to 100 tons weight, it vibrates with the slightest pressure of the hand. In the month of April, in the year 1824, whilst the "Nimble" cutter was lying off the Land's End, on the preventive service, the lieutenant in command, with fourteen of his men, after much perseverance, by means of hand pikes, and a hand screw, called by sailors *jack in the box*, succeeded in overthrowing this stone. This inconsiderate and mischievous act excited great indignation throughout Cornwall, and the officer received orders from the Admiralty to repair, if possible, and at his own expense, the mischief he had done; and in December in the same year, after three days' labour and exertion, the logan stone was replaced upon its point of equilibrium, and now rocks as before. Its replacement was a most impressive sight. Greater multitudes than were ever before collected on that wild coast were assembled to behold an attempt which required all the skill and coolness of British seamen. Large chain cables were fastened round

the stone, and attached to the blocks by which it was lifted; and this was effected by the aid of three pair of large sheers, six capstans, worked by eight men each, and numerous pulleys. On the first day the rock was swung in the air by this complicated tackling, in the presence of about two thousand persons; much anxiety was expressed as to the success of the undertaking; the ropes were much stretched, and the pulleys, the sheers, and the capstans, all shrieked and groaned; the noise of the machinery being audible at some distance. Sufficient stays, however, were supplied to prevent accident, and the united efforts of sixty men were employed. On the third day, as the rock hung suspended over the place from which it had been thrown down, the person who directed the proceedings asked of the spectators, whether it was in the exact position. One man, who seemed to speak with the certainty of accurate knowledge, and to whose judgment others deferred, advised a little movement to one side, and, when his approbation was given, the stone was let down. As soon as this was done, the men who had been employed in replacing it fell on their knees and thanked God that no life had been lost; and it was not till they rose from this act of spontaneous devotion, that the multitude, who had been kept silent first by expectant suspense, and then by the devotional feelings which they partook, filled the air with their huzzas!

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE COTTAGE HOME.

oft have I roam'd amid the hills
With sense of awe that inly thrills,
And listen'd to each sound
Which gives so deep an emphasis
To silence, and makes loneliness
Seem only more profound.
I've pass'd through crowded street and mart,
With yet more solitude of heart
Than ever yet was mine,
When, wandering "in untrodden ways,"
Wild nature to my awe-struck gaze
Reveal'd her inner shrine.
Fitful of mood—by impulse sway'd,
How oft we make the sun and shade
Which lights or dims our way;
View'd through some medium of our own,
Now seems our path with weeds o'ergrown.
And now with roses gay.
But yesterday, at Fancy's call,
I sought the rushing waterfall,
The wild and lonely glen;
To-morrow, it may be my mood,
To mingle with the multitude,
And list "the hum of men."
Meanwhile, 'tis mine well-pleased to view,
'Twixt both extremes a medium true,
In this low cottage-home;

(1) See Engraving, page 1.

For here I find society,
From noise, and strife, and tumult free,—
Seclusion without gloom.

Those little curly-pated elves,
Blest in each other and themselves,
Right pleasant 'tis to see
Glancing like sunbeams in and out
The lowly porch, and round about
The ancient household tree.

And pleasant 'tis to greet the smile
Of her who rules this domicile
With firm but gentle sway;
To hear her busy step and tone,
Which tell of household cares begun
That end but with the day.

'Tis pleasant too to stroll around
The tiny plot of garden ground,
Where all in gleaming row
Sweet primroses, the spring's delight,
And double daisies, red and white,
And yellow wall-flowers grow.

What if such homely view as this
Awaken not the high-wrought bliss
Which loftier scenes impart?
To better feelings sure it leads,
If but to kindly thoughts and deeds,
It prompt the feeling heart.

Recollections of the Lakes, [by Mrs. Hay.]

THE DEER.

BY RACHEL L.—.

In the long summer days, in the shade of green trees,
Whose thickly leaved branches scarce stir in the breeze,
When the bright sun looks down from the cloudless blue sky,
In the depth of the wood live my children and I.
We drink the pure stream as it babbles along,
And refreshing to hear is its soft murmured song;
The greenest young branches we pluck for our food,
And crop the young herbage we find in the wood.
We are blithesome and gay, when the winter is past,
To think the warm sunshine is coming at last;
And our bright eyes keep watch o'er the violets' beds,
To see 'mid the broad leaves the first purple heads;
And our hearts are made merry the while of the day,
When the snows of old Winter are melted away.
The cuckoo we welcome, and see with delight
Each feathery songster return from his flight.
Then the hot summer comes, and we stand in the stream,
With its bright gravelled bottom, and sound like a dream;
We watch the young saplings that darken and grow,
Till each is beginning a shadow to throw.
In the joy of sweet summer we run, skip, and bound,
Tossing high our proud antlers, scarce touching the ground,
Scarce brushing the dew-drops from off the long grass,
Scarce stirring the scent of the flowers as we pass.
We know well how the seasons are hastening on
By the sounds and the sights that are come and are gone.
Then the autumn arrives, with its bright coloured flowers,
And its bunches of ripe nuts, that tumble in showers.
If in passing or browsing we shake the green trees,
Or they are stirred by the sound of the cool evening breeze,
That the winter is coming with crisp white snow,
And the bleak northern wind is preparing to blow,
And the golden leaves falling seem softly to say,
"The flowers and the sun-beams are going away."

Yet the winter will pass, and the young birds will sing
Another sweet song to another green spring.

O when your cheek glows and your eye kindles bright,
And your hearts are made glad by the merry sunlight,
Then think of the deer in his forest of green,
And the many sweet sights that he may have seen ;
Nor neglect to make use of your time all you can,
For there is but one spring-time that cometh to man.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

A RAILWAY THROUGH THE WILDERNESS.

A FEW years ago it was a fatiguing tour of many weeks to reach the Falls of Niagara from Albany. We are now carried along at the rate of sixteen miles an hour, on a railway often supported on piles, through large swamps covered by aquatic trees and shrubs, or through dense forests, with occasional clearings, where orchards are planted by anticipation among the stumps, before they have even had time to run up a log-house. The traveller views with surprise, in the midst of so much unoccupied land, one flourishing town after another, such as Utica, Syracuse, and Auburn. At Rochester he admires the streets of large houses, inhabited by 20,000 souls, where the first settler built his log-cabin in the wilderness only twenty-five years ago. At one point our train stopped at a handsome newly-built station-house, and, on looking out at one window, we saw a group of Indians of the Oneida tribe, lately the owners of the broad lands around, but now humbly offering for sale a few trinkets, such as baskets ornamented with porcupine quills, mocassins of moose-deer-skin, and boxes of birch bark. At the other window stood a well-dressed waiter, handing ice and confectionery. When we reflect that some single towns, of which the foundations were laid by persons still living, can already number a population equal to all the aboriginal hunter tribes who possessed the forest for hundreds of miles around, we soon cease to repine at the extraordinary revolution, however much we may commiserate the unhappy fate of the disinherited race.—*Lyell's Travels in North America*.

A DILEMMA !

WITH the utmost possible despatch a handsome letter arrived from the Emperor (of China), agreeing in full with H. B. M.'s plenipotentiary's demands, and stating that his Imperial Majesty regarded alike all outside and inside subjects; and that due consideration should in future be shown to all of us. This instantly called forth a reply, to show that we by no means considered ourselves his subjects, outside or inside; the letter concluding with this remarkable sentence—"That H. B. Majesty owned no superior but God." This was given to the interpreter to translate into Chinese. After long consideration, they all declared, that such was the imperfection of the Chinese language, that the only way in which they could translate the sentence, was by placing the word "emperor" in Chinese for the word "God;" thus rendering the sense precisely and diametrically opposed to what was intended. Eventually, they found themselves obliged to make use of the expression, "the Emperor's father;" paternal respect being carried so far, that this is the best expression they could adopt, which would in any way serve to explain their meaning.—*Captain Cunningham's Recollections*.

THE KING AND THE BIRD-CATCHER.

A FEW years before the King's death a dealer in singing birds from the Prussian part of the Hartz mountains came to Berlin, and called at the palace to express, in what he thought the best way, his thanks for the kindness which had been shown to his sons, who were soldiers—namely, by presenting to the King a so-called piping bull-finch, which, with enduring patience, he had taught to pipe the national air of "Hail! Frederick William," &c., throughout and correctly—this being the only instance of perfect success. The King smiled, and ordered the bird-fancier to be shown up, who having placed the cage containing the interesting songster on the table, the bird, after some kindly words from its music master, went through the practised air with all the solemnity of a cathedral priest, to the surprise and amusement of the King, whose delight increased when, on his saying, "Da Capo," the bird piped the air again. To the question, "What's the price?" the pleased Papageno replied, "I won't take money for him; but if my dear King will accept the bird, and love him, the bare thought of his piping in the King's chamber will make me the happiest man of our Hartz, and the first bird-catcher in the world." The King felt good-will towards the honest fellow, who stood before him unabashed in his linen jacket; and Timm, who had been summoned, received his Majesty's command to have a room prepared for the bird-fancier in the adjoining wing of the palace, who was more than once summoned into the King's presence, who inquired minutely as to the localities of his part of the Hartz, and was amazed at his sensible and frank replies. During this stay Timm adroitly obtained such knowledge of his private circumstances and views as contented the King. When the time for the man's departure came, Timm franked him by the diligence. Arrived at home, he found to his utter astonishment that the mortgage of 500 dollars on his house had been paid off by command of his Majesty. Thus was his unhopd-for but highest earthly desire accomplished whilst he was enjoying the sights in Berlin.—*Van Eyck's Life of the late King of Prussia*.

TESTS are, as it were, sauce, whereby we are recreated, that we may eat with more appetite; but, as that were an absurd banquet in which there were few dishes of meat, and much variety of sauces, and that an unpleasant one where there were no sauce at all; even so that life were spent idly, where nothing were but mirth and jollity; and again, that tedious and uncomfortable, where no pleasure or mirth were to be expected.—*Sir T. More*.

If there is any one eminent criterion, which, above all the rest, distinguishes a wise government from an administration weak and improvident, it is this—"well to know the best time and manner of yielding what it is impossible to keep."—*Burke*.

WHETHER I am praised or blamed, says a Chinese sage, I make it far to my advancement in virtue. Those who commend, I conceive to point out the way I ought to go; those who blame me, as telling me the dangers I have run.

LIFE AND WRITINGS OF SCHILLER.

POETRY and imaginative literature must always suffer from translation; and thus it is impossible duly to estimate their merit, where we cannot read them in their proper tongue. But no poets and imaginative writers have suffered so deeply in the estimation of our countrymen, as those of Germany. This, at first, appears paradoxical; since the German language is exactly that, of all others, (unless we except the kindred dialects,) which is most easily transferred into our own, and the spirit of which has the closest affinity with the English. But the cause is external to the nature of the subject. Prejudice was early excited against German literature, and on two very distinct grounds, moral and literary. About the time of the first French revolution, anarchical and immoral publications were imported from Germany no less than from France. German poetry, indeed, was born at a period when all departments of literature were more or less tainted with revolutionary

principles, which were too hastily identified with the temper of the people; and, as it was from translations of lax writings that the idea of German literature was mainly collected by the English public, it was concluded that all German fiction must be anarchical and immoral. It seems needless seriously to rebut such a conclusion. From the literature of our own country, probably the purest in the world, it would be easy to export an equivalent for our imported German impurities. It is to be admitted, however, that most of the noblest productions of German imagination have appeared since the period alluded to. Another objection was, that the literature of Germany was not modelled on the principles of those of Greece and Rome, which were supposed to be the casting-moulds of the English mind; though, in reality, a French caricature was the standard, and the reader of Racine flattered himself that he understood Sophocles. It was forgotten that the great charm of the Greek literature was its originality and freshness; and that thus the qualities condemned in

the German were really the very same which those inconsistent censors admired in the Greek.

These prejudices are not wholly passed away; but a better and a juster spirit is awakening. The German writers gave an impulse to the poetry of our own country, and sent our language to its native resources. Wordsworth, Southey, Coleridge, Scott, among the foremost—all more or less influenced by German literature—have rescued us from being mere imitators. We have, accordingly, revised our condemnation of our German brethren, and sought to be better acquainted with them. The result has been that we have found our judgment as erroneous as it was rash. We find the imaginative literature of Germany perhaps the noblest and most splendid in the world, next to our own, and even more copious.

It must be remembered that it is only of the imaginative part of German literature that we are here treating. With its refinements in metaphysics, and its melancholy wanderings in theology, we are not now concerned. That portion which we have here been considering, is not only little affected by these things, but favourable and conducive to worthier objects. We are not unaware that the case of Goethe, the most conspicuous of German imaginative writers, may be cited as an example against us. Yet, eminent as he is, he is but one; and from his voluminous writings much might be selected which would even strengthen our position.

Our present purpose, however, is to apply these remarks to the compositions of Schiller, a writer who disputes with Goethe himself the throne of German imagination, but whose imaginative writings, with little more than one early well-known exception, are conducive to pure amusement or elevated instruction. It is not, of course, our intention to present a formal criticism on compositions so varied and so numerous as Schiller's. We shall prefer illustrating, in broad outline, his more celebrated pieces, in connexion with a biographical sketch, which will, with our brief extracts and criticisms, serve the purpose of mutual illustration. Our source will be chiefly a memoir, written in the year 1812, by his friend Körner of Dresden, father of the youthful patriot whose biography we have sketched in a former number. From the year 1785, he was one of Schiller's most intimate friends, and wrote from personal knowledge chiefly; and, when this was not the case, from the most authentic information. This sketch we shall illustrate, where convenient, from the lives of Schiller, by Mr. Carlyle and Sir Bulwer Lytton; the latter of whom is not only an able biographer, but an abbreviator of those who had the best opportunities for the successful prosecution of the task.

John Christopher Frederick Schiller, best known by the last of his Christian names, was born November 10, 1759, at Marbach, on the Neckar, in the duchy of Württemberg. His father, John Caspar Schiller, was originally an army surgeon, who afterwards entered the army itself, and ended his days as manager of a very extensive nursery-plantation at Ludwigsburg, belonging to the duke. Though not a well-educated man, he strove to compensate this defect by diligent labour; and a thanksgiving prayer of his is still extant, written after his son had attained celebrity, in which he commemorates the fact, that, from the birth of his son, he had not ceased to pray that the deficiencies of his boy's educational means might in some way be supplied to him. He appears to have been a good parent and a good man: nor were the excellencies of his wife inferior. She was affectionately attached to her husband and her children, and mutually and deeply beloved. Although of slender education, she could relish the religious poetry of Utz and Gellert. The early characteristics of young Schiller, as described by Körner, were piety, gentleness, and tenderness of conscience. He received the rudiments of his education at Lorch, a frontier village of the Württemberg territory, where his parents were residing from 1765 to 1768. His tutor here was a parochial minister, named Moser, after whom, perhaps, he drew

the character of Pastor Moser, in "The Robbers." The son of this tutor was his earliest friend, and is thought to have excited the desire which he long felt of entering the ministry.

Schiller's poetical temperament was early developed. When scarcely past the period of infancy, it is said, he was missed during a thunderstorm. His father sought him, and found him in a solitary place, on a branch of a tree, gazing on the scene. On being reprimanded, he is said to have replied, "The lightning was very beautiful, and I wished to see whence it came." Another anecdote of his childhood is better authenticated. At the age of nine years, he, and a friend of the like age, received two kreutzers apiece for repetition of their catechism in church. This money they resolved to invest in a dish of curds and cream at Harteneck; but here the young adventurers failed to obtain the desired delicacy, while the whole four kreutzers were demanded for a quarter cake of cheese, without bread! Thus foiled, they proceeded to Neckarweihingen, where they accomplished their object for three kreutzers, having one to spare for a bunch of grapes. On this, young Schiller ascended an eminence which overlooks both places, and uttered a grave poetical anathema on the barren land, and a like benediction on the region of cream.

On his father's return to Ludwigsburg, young Schiller, then nine years old, first saw the interior of a theatre. This circumstance seemed at once to disclose his genius. From that moment, all his boyish sports had reference to the drama; and he began to forecast plans for tragedies. Not that his inclination to the profession of his early choice diminished. He only regarded dramatic literature and exhibitions as amusements and relaxations from severer pursuits. He now continued his studies in a school at Ludwigsburg, where he was conspicuous for energy, diligence, and activity of mind and body. The testimonials which he here received induced the duke to offer him a higher education, in a seminary at Stuttgart, which he had lately founded. His father, who felt his obligations to the duke, and not least the favour which was now offered him, reluctantly abandoned his original intention of indulging his son with the profession of his wishes; and young Schiller, still more reluctantly, in 1778, surrendered the Church for the bar. In the following year, when each scholar of the establishment was called on to delineate his own character, he openly avowed "that he should deem himself much happier if he could serve his country as a divine." And he found legal studies so little attractive, that, on the addition of a medical school to the establishment, in 1775, he availed himself of the duke's permission to enrol himself a member.

During this period, Schiller was not inattentive to the revolution, or rather, creation, then working in the poetry of Germany. The immense resources of the German language were, in great measure, unknown to the Germans themselves. They studied and composed in the classical tongues, and, finding their own so far removed from those which they contemplated as the only models, regarded it as barbarous; or, if they condescended to use it, endeavoured to cast both words and sentiments in a classical mould. But there were minds among them who were beginning to perceive that the defects of German literature were not inherent, but the natural result of endeavouring to bind a singularly free and original language to rules and imagery foreign to its genius. Klopstock, Utz, Lessing, Goethe, and Gerstenberg, were, in different manners and degrees, of this order. From the study of these, Schiller caught the spirit of a German originality, which he afterwards so remarkably contributed to advance. Becoming, about the same time, acquainted (through Wieland's translation) with the writings of Shakspeare, he studied them with avidity and delight; though, as he acknowledges, with an imperfect comprehension of their depth. During his residence at Stuttgart, he had composed an epic, entitled "Moses," and a tragedy called "Cosmo de"

Medici," part of which was afterwards worked up in "The Robbers." But he had no sooner decided on the medical profession, than he resolved to abandon poetry for two years. He wrote a Latin treatise "On the Philosophy of Physiology," and defended a thesis "On the Connexion of the Animal and Spiritual Natures in Man." He afterwards received an appointment as a military surgeon, and was esteemed able in his profession. On the expiration of his probational course, he held himself free to prosecute his favourite study. Accordingly, in the year 1780, the famous play of "The Robbers" saw the light. It was published at his own expense, no bookseller venturing to undertake it.

Of the genius displayed in this work there can be but one opinion. The language of Coleridge concerning it is very remarkable:

"Schiller! that hour I would have wished to die,
If through the shuddering midnight I had sent
From the dark dungeon of the tower time-rent
That fearful voice, a famish'd father's cry!
That in no after-moment aught less vast
Might stamp me mortal! A triumphant shout
Black Horror scream'd, and all her goblin rout
From the more withering scene diminish'd past.
Ah! hard tremendous in sublimity!
Could I behold thee in thy loftier mood,
Wandering at eve with finely frenzied eye,
Beneath some vast old tempest-swinging wood!
Awhile with mute awe gazing I would brood,
Then weep aloud in a wild ecstasy!"

Nevertheless, the defects of this work are not less glaring than its power is unquestionable; nor are these defects literary only. The sympathies of the reader are in part enlisted on the side of crime; while the whole spirit of the play but too well coincides with the tumultuous character of that period. And yet, we believe it is not less truly than finely said by Sir Bulwer Lytton, "Nothing could be further from the mind of the boy from whose unpractised hand came this rough Titan sketch, than to unsettle virtue, in his delineations of crime. Virtue was then, as it continued to the last, his ideal; and if at the first he shook the statue on its pedestal, it was but from the rudeness of the caress that sought to warm it into life." Schiller's religious and virtuous feelings had, however, unconsciously to himself, been deteriorated by the French sceptical writers. Voltaire moved his scorn and disgust; but abhorrence of filth will not save us from pollution, if we permit its contact. Rousseau, insidious and visionary, harmonized but too well with the temperament of the earnest and contemplative youth; we know from the painful evidence of a little poem of Schiller's, bearing the name of that subtle anarchy, that the influence had been but too effective; and we trace the fact even more distinctly in the "Philosophical Letters." But it would seem from his own testimony, no less than from general evidence, that the military despotism which was the constitution of the seminary at Stuttgart was the real creative principle of the "Robbers." It furnished Schiller's idea of order and government, while his own restlessness beneath that rigid coercion supplied his notion of liberty. It was from a translation of the "Robbers," that the general tendency of German literature, and of the drama particularly, was estimated in England. The "Robbers" could not long be a stranger to the stage. The Freiherr von Dalberg, manager of the theatre at Mannheim, produced it on his boards in 1782. Schiller was present at the two first representations in January and May of that year. His absence, however, was known to the duke, and he was placed under arrest for a fortnight.

But his misfortunes did not end here. A passage in the "Robbers" gave offence to the Grisons,⁽¹⁾ who complained to the duke against his subject. The result was that Schiller was prohibited from all but professional writing, and commanded to abandon all connexion with other states. But Körner informs us

that, however exasperated at the time, he spoke in cooler moments kindly of the duke, and even justified his proceeding, which was not directed against the poet's genius, but his ill-taste. He, indeed, even dwelt warmly on the duke's paternal conduct, who gave him salutary advice and warning, and asked to see all his poetry. This was resolutely refused; and the refusal, as might be expected, was not inoffensive. Yet the duke seems not to have renounced his interest in his young favourite, for no measures were taken against him or his family on his subsequent departure from Stuttgart, and Schiller even paid a visit to them during the duke's life, without any molestation. For this departure he wished the duke's permission, and endeavoured, through his friend Dalberg, to obtain it; but, impatient at the tediousness of the negotiations, he took advantage of the festivities occasioned by the visit of the Archduke Paul of Russia, in October, 1782, and left Stuttgart unperceived.

His mother and sister were in the secret; his father had not been informed, lest loyalty and military subordination should compel disclosure to the duke. There was another person left behind, in whom rumour attributes an interest to Schiller, though we are not informed whether she was apprised of his flight. This was the widow of a military officer, to whom, it is said, Schiller had paid his addresses, and who is by some supposed to be the "Laura" of his early poems. A youth named Streicher was the companion of his wanderings. All Schiller's fortune lay in his tragedy, "The Conspiracy of Fiesco at Genoa," which he had, for the most part, composed when under arrest. Arrived at Mannheim, he recited his play to the stage-manager, Meier, (for Dalberg was at Stuttgart,) with little success. His Swabian dialect, and unmelodious declamation, drove away all his audience save Illand, to whose personation his "Francis Moor" in "the Robbers" had been deeply indebted. But, on a perusal, Meier acknowledged the real merit of "Fiesco," and agreed to produce it on the stage, if Schiller would make the requisite alterations. Meanwhile, Schiller and his friend were warned, by letters from Stuttgart, that their position at Mannheim was perilous. They accordingly once more took flight, and, after many hardships, took up their quarters at an inn at Oggersheim, where "Fiesco" was completed, and "Cabal and Love" begun. While at this place, Schiller was offered an asylum at Bauerbach, near Meinungen, an estate of Madame von Wollzogen, with whose sons he had studied at Stuttgart. Having disposed of his "Fiesco" to a bookseller, he with alacrity accepted the generous offer, and Streicher pursued his way to Hamburg. At Bauerbach, Schiller found repose and appliances for study; finished "Cabal and Love," and sketched "Don Carlos." Of the two first of these works our limits will not permit us to speak. They are not without evidence of their author's genius; but they are not less evidential of a taste which he lived to correct, and which, even at this period, he was correcting.

"Don Carlos" is an immeasurable advance into the regions of taste and order. The wild irregular prose of the previous dramas is exchanged for rich and melodious blank heroic verse: the characters are no longer the crude imaginations of an undisciplined ardour, but finished studies from nature, in historical prototypes; no longer bold distorted sketches, but richly, yet chastely, coloured pictures; no longer flung together in heedless and disorderly profusion, but grouped with consummate art and sense of harmony. Yet it is probable that the historian has in this work encroached upon the poet, and rendered it in parts obscure, and the connexion not always palpable. It is far less lucid than the great dramatic writings which formed the labours of Schiller's later days. A considerable interval elapsed between the composition of the first and last portions; and, as the former was printed, the drama could not well be rewritten, to make it harmonize with Schiller's altered feelings and opinions; but it spoke a great promise, and gave earnest of a faithful performance.

(1) He had called their country "the thief's Athens."

It has been ably translated by Francis Herbert Cottrell, Esq.

In 1785, Schiller took up his residence at Mannheim, where he occupied himself with theatrical projects. From this place he wrote to Madame von Wollzogen, soliciting the hand of her daughter Charlotte; but it appears that the attachment was not mutual, though Schiller always continued to be received in the most friendly manner by Madame von Wollzogen and her daughters. Perhaps the young lady herself regarded Schiller's as rather a preference than an affection, which she seems to have been justified in doing, as, not long after, he formed an attachment to Margaret, daughter of his friend Schwann the bookseller; a lady whom some suppose to have been his "Laura." During this period he wrote essays on dramatic subjects, edited a periodical called "The Rhenish Thalia," composed a poem called "Conrad of Swabia," and a second part of the "Robbers," to harmonize the incongruities of the first. Some scenes of his "Don Carlos," appearing in the "Thalia," attracted the notice of the reigning Duke of Saxe Weimar, who was then on a visit to the court of the Landgrave of Hesse Darmstadt. The duke was a lover of literature, and a poet, and he appointed Schiller a member of his council. In March, 1785, Schiller removed to Leipzig, where his poetry had prepared him many friends, and from this year commenced what is called "the second period" of Schiller's life. He spent the summer at a village in the neighbourhood, named Golis, surrounded by warm and affectionate hearts. It was during this time that he wrote his "Ode to Joy." But his joy was fated to be overclouded. He wrote to Schwann soliciting a union with his daughter; a request to which he had no anticipation of refusal, as he and the young lady had corresponded; and, had his destiny rested in her hands, there can be little doubt that he would not have been doomed to disappointment. The father, however, had apparently seen enough of Schiller's habits to infer that his wealth was not likely to equal his fame, and the poet was once more met with a refusal.

From the friendly circle at Leipzig he removed to Dresden the same year. Here he completed his "Don Carlos," which he recast, as far as was practicable; and is thought to have assimilated his princess Eboli to a certain Fräulein A—, a great beauty of that city. Here, too, he sketched the plan of a drama which he named "The Misanthrope;" collected materials for a history of the revolt of the Netherlands, under Philip II.; and wrote his strange romance of "The Ghost Seer;" a work suggested by the quackeries of Cagliostro. At this period, also, were written the "Philosophical Letters," before alluded to. In 1787 he repaired to Weimar, where he was received with great enthusiasm by Herder and Wieland. Here he undertook the management of a periodical called "The German Mercury," which he enriched with several contributions in verse and prose, and to which he imparted new life and vigour. In the same year he received an invitation from Madame von Wollzogen to visit her at Meinungen. On his return thence he made a brief sojourn at Rudolstadt, but a memorable one, as it was here that he saw the Fräulein von Langefeld. This event called forth the following observations in a letter to a friend:

"I require a medium through which to enjoy other pleasures. Friendship, taste, truth, and beauty would operate on me more powerfully, if an unbroken train of refined, beneficent, domestic sentiments attuned me to joy, and renewed the warmth of my torpid being. Hitherto I have been an isolated stranger wandering about amid nature, and have possessed nothing of my own. I yearn for a political and domestic existence. For many years I have known no perfect happiness, not so much for want of opportunities, as because I rather tasted pleasures than enjoyed them, and wanted that even, equable, and gentle susceptibility which only the quiet of domestic life bestows."

It may be well imagined that Schiller repaired to Rudolstadt again, as early as possible. He spent the following summer there, and partly at Volkstädt, in

the same neighbourhood. Here he cultivated the friendship of the Langefeld family, and extended the circle of his friends; and during this sojourn he made his first acquaintance with Goethe. His first impressions of the great master of German imagination are thus detailed:—

"On the whole, my truly high idea of Goethe has not been diminished by this personal intercourse; but I doubt whether we shall ever approach very closely. Much which is yet interesting to me, much which is yet among my wishes and my hopes, has with him lived out its period. His whole being is, from the first, very differently constituted from mine; his world is not mine. Our modes of imagination are essentially distinct. However, no certain and well-grounded intimacy can result from such a meeting. Time will teach further."

And the lesson was soon imparted; especially when it is considered that all Goethe's prejudices were revolted by "The Robbers," and that he had actually avoided an interview as long as possible. But in a few months Goethe's interest in Schiller, and high estimate of his abilities, were practically exemplified. "The Revolt of the Netherlands" had in part seen the light, and obtained high reputation for Schiller as a historian. By the efforts of Goethe, he was now appointed to the Chair of History in the University of Jena.

In this situation Schiller laboured diligently, not only in reading and writing history, but also in the continued cultivation of poetry. He was at all times, as such a mind might be expected to be, devoted to classical literature. But, at this period, he imposed on himself a course of this study with a direct view to the purification of taste and style. He studied Homer profoundly, and with great delight. He translated into German the "Iphigenia in Aulis" (with the exception of the last scene), and a part of the "Phœnissæ" of Euripides. His freedom, yet accuracy, particularly in the former of these translations, can scarcely be sufficiently admired. He projected a version of the "Agamemnon" of Æschylus, a play in which he much delighted. Bürger visited him at Weimar, in 1789, and the friends agreed to translate the same passage of Virgil, each in a metre of his own selection. These studies had a perceptible influence on his poetry, particularly his dramas.

Schiller's inaugural lecture at Jena was attended by an audience of more than 400; nor did it disappoint the high expectation which had been formed of it. His pen was now a ready and certain source of emolument; a "History of the Thirty Years' War," and a "German Plutarch," among various minor literary enterprises, were put in preparation. He was admired and caressed by the great; a pension was assigned him by the Duke of Saxe Weimar, and there was now no obstacle to the fulfilment of his dearest wishes. In February, 1790, he had the happiness to obtain the hand of the Fräulein von Langefeld. We here cast together, from several of his letters, as selected by Körner, passages descriptive of his enjoyment:—"It is quite another life, by the side of a beloved woman, from that which I led before, so desolate and solitary; even in summer, I now, for the first time, enjoy beautiful Nature entirely, and live in her. All around me is arrayed in poetic forms, and within me, too, they are oft stirring. What a beautiful life am I now leading! I gaze around me with joyful spirit, and my heart finds an everduring gentle satisfaction from without! My soul experiences such sweet support and refreshment! My being moves in harmonious evenness; not overstrained by passion, but calm and bright are the days which I pass. I look forward on my destiny with cheerful spirit; standing at the goal of my desires, I am myself astonished to think how all has succeeded beyond my expectations. Destiny has overcome my difficulties, and brought me smoothly to the end of my career. From the future I have every thing to hope. A few years, and I shall live in the full enjoyment of my mind; nay, I even hope to return to youth; the poet-life within me will restore it."

This language, while it proves the writer's affection,

purity, and elevation of mind, conveys a painful impression that his worldly happiness had rendered him insensible, at least for a time, to considerations which are not less needful in such moments than amid the darkest sorrows; but of which our ingratitude then most loses sight, when the love which would awaken them is most conspicuous. How little do we know our real happiness, when we envy the sunshine of Schiller's heart, or repine in the night of solitude and abandonment! In that sunshine he had lost sight of the pole-star whereby alone his voyage could be directed, and which is ever clearest when other lights are away. In his prosperity, like the Psalmist, he had said, "I shall never be moved!" and, too probably, even without the pious acknowledgment which qualified that presumption, "Lord, by thy favour Thou hast made my mountain to stand strong." For though Schiller, under all circumstances, had never lost the first fresh devotional feelings of his boyhood, and had admitted doubts with pain, and desired to escape from them, yet he could not be as one whose faith was steadfastly grounded on the sure rock of Revelation. Like the Psalmist, however, he could add, "Thou didst hide thy face, and I was troubled." Mercy and chastisement, each involved in the other, overtook him in the beginning of the following year. He was afflicted with a severe attack of disease of the chest, from which, though "fifteen years were added to his life," he never recovered. His whole frame was shattered; and repeated relapses left him incapable of public lectures and every other laborious exertion. The diminution of income consequent on this calamity added much to its severity. But this was not long to be a part of his distress. The Crown Prince of Denmark, and the Count von Schimmelmänn, offered him a salary of 1000 thalers for three years, with a delicacy and kindness, as he informs us, not less gratifying than the boon itself. Unembarrassed now by narrow circumstances and public duties, he gave himself to the study of metaphysics. He had formed, at Jena, the friendship of Paulus, Schütz, Hufeland, and Reinhold; and by them he was initiated in the philosophy of Kant, which he has exemplified in some of his prose writings. To this Sir Bulwer Lytton attributes the Christian conviction and religious tone which, after this period (so marked as to be called "the third" in Schiller's life), pervades his compositions. We would rather ascribe it to the teaching of sickness, before the revelations of which the mists of sophistry and self-confidence vanish as in daylight. The thirtieth Psalm will still afford illustration. When David was troubled, his testimony was, "I cried unto thee, O Lord; and unto the Lord I made supplication." It is impossible to doubt that Schiller did likewise; or that he experienced a like return from Him who is unchangeable.

(To be continued.)

THE STILE.

BY THE AUTHOR OF "THE MAGI AND THE STAR."

To the poet and the moralist, the most trifling object may afford an occasion of serious musing. A Cowper can write beautiful poetry "on finding the heel of a shoe," and a Leigh Hunt can instruct and amuse by meditations "on a stone." Let us try if something amusing or instructive cannot be said about a stile.

These useful entrances to the fields have now in many places been made to give way to gates. Against this improvement we at least vehemently protest. Go on, ye improvers, if ye will, to perforate rocks, fell trees, and devastate estates,—bring, if you will, the clatter and shriek of steam-engines into our most lovely rural retreats—turn the beautiful cottages, with their picturesque

roofs, and the mantles of jessamine, honeysuckle, or roses, into edifices without shape or name; but, we entreat you, leave us our stiles. The male part of the community most certainly must wish their retention: and if any of the gentler sex desire their destruction, surely they cannot be the beautiful and the young. Where does a man find so befitting and easy an opportunity of exhibiting his agility and tenderness, as at a stile? There are now no longer any dragons or lions from which distressed damsels are to be delivered; enchanted castles and amorous giants have now all disappeared even from the nursery; but in some fortunate places, there still remain stiles. Gates, the modern substitutes, are strongly to be deprecated, for they forbid any exhibition of courtesy. Try it not, O enamoured reader! for most assuredly, instead of expediting the passage of your beloved by opening for her the gate, you will only awkwardly contrive to force it against her side, and put her out of temper for the rest of the walk. But let us see how much better things are managed where the stiles have been suffered to remain.

Let us, in fancy, follow for a few moments the couple who have just passed into yonder fields. With light, joyous step, lost in earnest conversation, they go trippingly over the grass, till their progress is stopped by the stile. The gentleman, pleased at the opportunity of displaying his legs and his nimbleness, steps gaily across: but the lady looks towards the barrier with trepidation. She declares that it will be impossible for her to cross. She has always disliked stiles, she says, and this is one of the worst she ever saw; they had better return and go some other way. The cavalier gently insinuates, that, by a little exertion, he thinks it might be passed: a transverse piece of wood will greatly assist the descent; and, besides, the other way is far less pleasant, and he is not certain whether by going in that direction they should not have to climb a five-barred gate. "And then," he adds, "am I not here to help you?" The last two arguments are conclusive, and mentally ejaculating "anywhere with him!" she places her foot on the lowest bar of the stile. Her *innamorato* then takes her hand: it is necessary that he should grasp it firmly, for the terror of the lady might induce her to let go her hold: it is also necessary that she should lean on his shoulder when she has gained the top of the stile; but was it necessary that she should remain so long in that position, or that he should place his arm around her as she descended? However, she is now safely landed on the other side: and the frank familiarity with which she presses his arm may be caused by her grateful recollections of the perils from which he has just rescued her. But let us follow them a little further. The next stile is less lofty; the top is broad and smooth; a board beneath forms a convenient resting-place for the feet: and the prospect around is delightful. Can they do otherwise than sit down upon it for a short time? The space is limited; it is necessary, therefore, that they should sit close to each other: there is no support for the back; the gentleman, therefore, cannot do otherwise than form one for his companion by placing his arm round her waist: and should he also grasp one of her hands, the circumstance may be attributed to his anxiety to save her from the slightest danger of a fall. There, then, they sit, side by side, thinking of course of nothing but the prospect: and there we must be contented to leave them, merely observing, that there are many worse situations in the world, than that of sharing with an amiable and virtuous woman the top of a stile.

But there are other uses to which the stile is applied. Some unfortunate invalid totters out for a walk, accompanied by his anxious wife. When he has walked some little distance, his strength begins to fail, and he becomes anxious to return. "Try, my dear," says the wife, encouragingly, "try to walk at least to the stile, and there you will be able to rest." The sufferer does so, and finds in the friendly stile a pleasant resting

place, whence he is able to return, refreshed and animated, to his home.

And then, how useful is the stile to the poet or the philosopher! Our ancestors, with a due regard for the interests of others, have often placed the stiles on spots which command beautiful prospects. Here, then, does the poet often sit and indulge in those delightful reveries which seem like a foretaste of Heaven—here does some “mute, inglorious Milton” frame those fantastical creations which are to die away unknown to the world—and here the more fortunate votaries of the muse shape those glittering conceptions which are afterwards enshrined for immortality in an “Excursion” or a “Task.” And here, too, the Christian moralist may have paused to gather some illustration to add point to his expositions of sacred truth.

It must be confessed, however, that there are some inconveniences attached to the stile. In rainy weather, for instance, it gets slippery: you mount with confidence, but your descent is disastrous: and a bruised ankle is sometimes the result. Another annoyance is, when you are passing through the fields in haste, to discover a large party making their way to the stile in an opposite direction. You hurry towards it in the hope of reaching it first: you are just too late; and have the satisfaction of standing still, looking like a simpleton, while one after another of your rivals proceeds slowly to ascend and descend; each one, as he or she steps down before you, casting on you a compassionate glance, and seeming to say, “Have patience; it will be your turn by-and-by; there are only a dozen of us!”

It is with a pleasing melancholy that we gaze on the worn and worm-eaten top of the stile, and think of those who, in succession, have pressed it. There have the children from time immemorial gathered to play, choosing, with the usual perversity of childhood, the very spot where they are most in the way; there has sat the aged, musing on the past with the calm of gratified desire, or perhaps, envying the robust strength of those whom he sees labouring in the field; there has sat the sentimentalist whom uncongenial society has driven to solitude, and who finds in the trees and the birds a more cheerful companionship than that of unsympathising man; and thither, perhaps, has the wanderer returned after many years of toil and sorrow in other lands, to retrace the haunts of his childhood, and to weep bitter tears over the well-remembered spot which he once enjoyed in the society of those at length estranged from him or dead. Yes; across the stile may they all have passed; and now beneath yonder grassy hillocks, “after life’s fitful fever, they sleep well;” while, perhaps, seated on the spot which they once occupied, the care-worn man looks towards their graves, and sighs for the day when he may be permitted to share in the repose which he trusts they are now enjoying; or the ambitious enthusiast, shrinking from the oblivion in which they seem to be enwrapped, pants to win for himself an immortality even on earth, by leaving behind him something which may benefit his fellows, and which the world shall “not willingly let die.”

M. N.

FRANK FAIRLEGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. II.

AMONGST the minor phenomena which are hourly occurring in the details of every-day life, although we are seldom sufficiently close observers to perceive them, there is none more remarkable than the change wrought in our feelings and ideas by a good night’s rest; and never was this change more strikingly exemplified than on the present occasion. I had fallen asleep in the act of performing the character of chief-mourner at my own funeral, and I awoke in the highest possible health and

spirits, with a strong determination never to “say die” under any conceivable aspect affairs might assume. “What in the world,” said I to myself, as I sprang out of bed and began to dress,—“what in the world was there for me to make myself so miserable about last night? Suppose Cumberland and Lawless should laugh at, and tease me a little at first, what does it signify? I must take it in good part as long as I can, and if that does not do, I must speak seriously to them,—tell them they really annoy me, and make me uncomfortable, and then, of course, they will leave off. As to Coleman, I am certain—Well, it’s very odd!”—This last remark was elicited by the fact, that a search I had been making for some minutes, in every place possible and impossible, for that indispensable article of male attire, my trowsers, had proved wholly ineffectual, although I had a distinct recollection of having placed them carefully on a chair by my bedside, the previous night. There, however, they certainly were not now, nor, as far as I could discover, any where else in the room. Under these circumstances ringing the bell for Thomas seemed advisable, as it occurred to me that he had probably abstracted the missing garment for the purpose of brushing. In a few moments he answered the summons, and, with a face bright from the combined effects of a light heart and a severe application of yellow soap, inquired, “if I had rung for my shaving-water?” “Why, no—I do not—that is, it was not—I seldom shave of a morning; for the fact is, I have no beard to shave as yet.” “Oh, sir, that’s no reason; there’s Mr. Coleman’s not got the leastest westige of a hair upon his chin, and he’s been mowing away with the greatest of perseverance for the last six months, and sends his rashier to be ground every three weeks, regular, in order to get a beard—but what can I do for you, sir?” “Why,” replied I, trying to look grave, “it’s very odd, but I have lost—that is, I can’t find—my trowsers anywhere. I put them on this chair last night, I know.” “Umph! that’s sing’lar, too; I was just a coming up stairs to brush ‘em for you; you did not hear any body come into your room, after you went to bed, did you, sir?” “No; but then I was so tired, I slept as sound as a top.” “Ah! I shouldn’t much wonder if Mr. Coleman knew something about ‘em: perhaps you had better put on another pair, and if I can find ‘em, I’ll bring ‘em back after breakfast.” This was very good advice, and therefore, of course, impossible to follow; for, on examining my trunk, lo and behold! dress pantaloons, white ducks, “et hoc genus omne,” had totally disappeared, and I seemed to stand a very good chance of making my first appearance at my tutor’s breakfast table, in an extemporary “kilt,” improvised for the occasion, out of two towels and a checked neckcloth. In this extremity Thomas, as a last resource, knocked at Coleman’s door, informing him, that I should be glad to speak to him,—a proceeding speedily followed by the appearance of that gentleman in propria persona. “Good morning, Fairlegh! hope you slept well. You are looking cold; had not you better get some clothes on? Mildman will be down in a minute, and there will be a pretty row if we are not all there; he’s precious particular, I can tell you.” “That is exactly what I want to do,” replied I, “but the fact is, somebody has taken away all my trowsers in the night.” “Bless me! you don’t say so? another case of pilfering! this is getting serious: I will call Lawless.—I say, Lawless!” “Now, what’s the row?” was the reply, “have the French landed? or is the kitchen chimney on fire? What do I see? Fairlegh, lightly and elegantly attired in nothing but his shirt, and Thomas standing like Niobe, the picture of woe,—here’s a sight for a father!” “Why! it’s a bad job,” said Coleman; “here’s another case of pilfering; Fairlegh has had all his trowsers stolen in the night.” “You don’t say so!” rejoined Lawless: “what is to be done? It must be stopped somehow: we had better tell him what we know about it. Thomas, leave the room.” Thomas obeyed, giving me a look of great

intelligence as he went, and Lawless continued, "I am afraid you will hardly believe us,—it is really a most unheard-of thing,—but we have lately missed a great many of our clothes, and we have every reason to suspect, (I declare I can scarcely bear to mention it,) that Mildman takes them himself, fancying, of course, that being placed by his position so entirely above suspicion, he may do it with impunity. We have suspected this for some time, and lately one or two circumstances,—old clothsmen having been seen leaving his study, a pawn-ticket falling out of his waistcoat pocket one day as he was going out of our parlour, &c.,—have put the matter beyond a doubt; but he has never gone to such an extent as this before. Mind you do not mention a word of this to Thomas, for, bad as Mildman is, one would not wish to show him up before his own servant." "Good gracious!" cried I, "I had no idea such things ever could take place, and he a clergyman, too!—dreadful! but what in the world am I to do? I have not got a pair of trowsers to put on. Oh! if he would but have taken any thing else, even my watch, instead, I should not have minded—what shall I do?" "Why really," replied Coleman, "it is not so easy to advise: you can't go down as you are, that's certain. Suppose you were to wrap yourself up in a blanket, and go and tell him you have found him out, and that you will call a policeman if he does not give you your clothes at once; have it out with him fairly and check the thing effectually once for all—eh?" "No, that won't do," said Lawless, "I should say, sit down quietly, (how cold you must be!) and write him a civil note, saying, that you had reason to believe he had borrowed your trowsers, (that's the way I should put it,) and that you would be very much gratified by his sending you a pair to wear to-day; and then you can stick in something about your being always accustomed to live with people who were particular about dress, and that you are sorry you are obliged to trouble him about such a trifle; in fact, do a bit of the respectful, and then pull up short with 'obedient pupil,' &c." "Aye, that's the way to do it," said Coleman, "in the shop-fellow's style, you know,—much obliged for past favours, and hope for a continuance of the same,—more than *you* do, though, Fairleigh, I should fancy, but there goes the bell—I am off," and away he scudded, followed by Lawless humming,—

"Brian O'Lynn had no breeches to wear,
So he took an old catskin and made him a pair."

Here was a pretty state of things: the breakfast bell had rung, and I, who considered being too late a crime of the first magnitude, was unable even to begin dressing, from the melancholy fact that every pair of trowsers I had in the world had disappeared; while, to complete my misery, I was led to believe the delinquent who had abstracted them was no less a person than the tutor, whom I had come fully prepared to regard with feelings of the utmost respect and veneration.

However, in such a situation, thinking over my miseries was worse than useless; *something* must be done at once,—but what? Write the note, as Lawless had advised? No, it was no good thinking of that; I felt I *could* not do it. "Ah! a bright idea!—I'll try it." So, suiting the action to the word, I rang the bell, and then, jumping into bed, muffled myself up in the bed-clothes.

"Well, sir, have you found them?" asked Thomas, entering. "No, Thomas," replied I dolefully, "nor ever shall, I fear; but will you go to Dr. Mildman, and tell him, with my respects, that I cannot get up to breakfast this morning, and, if he asks what is the matter with me, say that I am prevented from coming down by *severe cold*. I am sure that is true enough," added I, shivering. "Well, sir, I will, if you wish it; but I don't exactly see the good of it; you must get up sometime or other." "I don't know," replied I gloomily, "we shall see; only do you take my message." And he accordingly left the room, muttering as he did so, "Well, I call this a great deal too bad, and I'll tell

master of it myself, if nobody else won't." "Tell master of it himself!"—he also suspects him! then. This crushed my last faint hope that, after all, it might turn out to be only a trick of the pupils; and, overpowered by the utter vileness and depravity of him who was set in authority over me, I buried my face in the pillow, feeling a strong inclination to renew the lamentations of the preceding night. Not many minutes had elapsed, when the sound of a heavy footstep slowly ascending the stairs attracted my attention. I raised my head, and beheld the benevolent countenance (for even then it certainly *did* wear a benevolent expression) of my wicked tutor, regarding me with a mingled look of scrutiny and pity. "Why, Fairleigh, what's all this?—Thomas tells me you are not able to come down to breakfast; you are not ill, I hope?" "No, sir," replied I, "I don't think I am very ill, but I *can't* come down to breakfast." "Not ill, and yet you can't come down to breakfast! what in the world prevents you?" "Perhaps," said I, (for I was becoming angry at what I considered his unparalleled effrontery, and thought I would give him a hint that he could not deceive me so easily as he seemed to expect,) "Perhaps you can tell that better than I can."—"I, my boy!—I am afraid not; my pretensions to the title of doctor are based on divinity, not physic:—however, put out your tongue—that's right enough; let me feel your hand—a little cold or so, but nothing to signify; did you ever have this sort of seizure happen at home?" Well, this was adding insult to injury with a vengeance: not content with stealing my clothes himself, but actually asking me whether such things did not happen at home! The wretch! thought I; does he suppose that every body is as wicked as himself? "No," answered I, my voice trembling with the anger I was scarcely able to repress; "no, sir, such a thing never could happen in my dear father's house." "There, don't agitate yourself; you seem excited: perhaps you had better lie in bed a little longer; I will send you up something warm, and after that you may feel more inclined to get up," said he kindly, adding to himself as he left the room, "Very strange boy,—I can't make him out at all."

The door closed, and I was once more alone. "Is he guilty, or not guilty?" thought I; "if he really has taken the clothes, he is the most accomplished hypocrite I ever heard of; yet he *must* have done so, every thing combines to prove it—Thomas's speech—nay, even his own offer of sending me 'something warm;' something warm, indeed! what do I want with any thing warm, except my trowsers?" No! the fact was beyond dispute; they were gone, and he had stolen them, whilst I, unhappy youth, was entirely in his power, and had not therefore, a chance of redress. "But I will not bear it," cried I, "I'll write to my father,—I'll run away,—I'll—" "Hurra!" shouted Thomas, rushing into the room with his arm full of clothes, "here they are, sir! I have found the whole kit of them at last." "Where?" exclaimed I eagerly. "Where? why, in such a queer place!" replied he, "stuffed up the chimney, in master's study; but I've given them a good brushing, and they are none the worse for it, except them blessed white ducks; they are a most black ducks now, though they will wash, so that don't signify none." "Up the chimney, in master's study!" here was at last proof positive; my clothes had been actually found in his possession—oh, the wickedness of this world! "But how did you ever find them?" asked I. "Why! I happened to go in to fetch something, and I see'd a little bit of the leg of one of them hanging down the chimney, so I guessed how it all was, directly. I think I know how they got there, too, they did not walk there by themselves, I should say." "I wish they had," muttered I. "I thought *somebody* was up too early this morning to be about any good," continued he; "he is never out of bed till the last moment, without there's some mischief in the wind." This was pretty plain speaking, however. Thomas was clearly as well aware of his master's nefarious practices as the pupils themselves, and Law-

less's amiable desire to conceal Dr. Mildman's sins from his servant's knowledge was no longer of any avail. I hastened, therefore, (the only reason for silence being thus removed,) to relieve my mind from the burden of just indignation which was oppressing it. "And can you, Thomas," exclaimed I, with flashing eyes, "remain the servant of a man who dares thus to outrage every law, human and divine? one who, having taken upon himself the sacred office of a clergyman of the Church of England, and so made it his especial duty to set a good example to all around him, can take advantage of the situation in which he is placed in regard to his pupils, and actually demean himself by purloining the clothes of the young men (I felt five and twenty at the very least at that moment) committed to his charge?—why! my father"—what I imagined my father would have said or done under these circumstances, was fated to remain a mystery, as my eloquence was brought to a sudden conclusion by my consternation at a series of remarkable phenomena, which had been developing themselves during my harangue in the countenance of Thomas, terminating abruptly in what appeared to me a fit of most unmitigated insanity. A look of extreme astonishment, which he had assumed at the beginning of my speech, had given place to an expression of mingled surprise and anger as I continued; which again in its turn had yielded to a grin of intense amusement, growing every moment broader and broader, accompanied by rubbing together his hands, and a spasmodic twitching of his whole person; and, as I mentioned his master's purloining my trowsers, he suddenly sprang up from the floor nearly a yard high, and commenced an extempore *pas seul* of a Jim Crow character, which he continued with unabated vigour during several minutes. This "*Mazourka d'ecstasy*," or whatever a ballet-master would have called it, having at length, to my great joy, concluded, the performer of it sank exhausted into a chair, and regarding me with a face still somewhat the worse for his late violent exertions, favoured me with the following geographical remark:—"Well, I never did believe in the existence of such a place as Greenland before, but there's no where else as you could have come from, sir, I am certain." "Eh! why! what's the matter with you! have I done any thing particularly 'green,' as you call it? what are you talking about?" said I, not feeling exactly pleased at the reception my virtuous indignation had met with. "Oh! don't be angry, sir; I am sure I did not mean to offend you; but really I could not help it, when I heard you say about master's having stole your things. Oh lor!" he added, holding his sides with both hands, "how my sides do ache, surely!" "Do you consider that any laughing matter?" said I, still in the dark. "Oh! don't sir, don't say it again, or you will be the death of me," replied Thomas, struggling against a relapse, "why! bless your innocence, what could ever make you think master would take your clothes?" "Make me think? why! Lawless told me so," answered I, "and he also said, it was not the first time such a thing had occurred either." "You'll have enough to do, sir, if you believe all the young gentlemen tell you; why! master would as soon think of flying, as of stealing anything. It was Mr. Coleman as put them up the chimney; he's always a playing some trick for everlasting." A pause ensued, during which the whole affair in its true bearings became for the first time clear to my mind's eye; the result of my cogitations may be gathered from the following remark, which escaped me as it were involuntarily,—"What a confounded ass I have made of myself, to be sure!"

Should any of my readers be rude enough to agree with me in this particular, let them reflect for a moment on the peculiar position in which I was placed. Having lived from childhood in a quiet country parsonage, with my father and mother, and a sister younger than myself, as my sole companions, "mystification," that is, telling falsehoods by way of a joke, was a per-

fectly novel idea to me, and, when that joke involved such serious consequences as offending the tutor under whose care we were placed, I (wholly ignorant of the impudence and recklessness of public school boys) considered such a solution of the mystery inconceivable. Moreover, every thing around me was so strange, and so entirely different to the habits of life in which I had been hitherto brought up, that for the time my mind was completely bewildered. I appeared to have lost my powers of judgment, and to have relapsed, as far as intellect was concerned, into childhood again. My readers must excuse this digression, but it appeared to me necessary to explain how it was possible for a lad of fifteen to have been made the victim of such a palpably absurd deception, without its involving the necessity of his not being "so sharp as he should be."

The promised "something warm" made its appearance ere long, in the shape of tea and toast, which, despite my alarming seizure, I demolished with great gusto in bed, (for I did not dare to get up,) feeling, from the fact of my having obtained it under false pretences, very like a culprit all the while. Having finished my breakfast, and allowed sufficient time to elapse for my recovery, I got up, and, selecting a pair of trowsers which appeared to have suffered less from their sojourn in the chimney than the others, dressed myself, and soon after eleven o'clock made my appearance in the pupil's room, where I found Dr. Mildman seated at his desk, and the pupils apparently very hard at work. "How do you find yourself now you are up, Fairleigh?" inquired my tutor kindly. "Quite well, sir, thank you," I replied, feeling like an impostor. "Quite recovered?" continued he. "Every thing—entirely, I mean," stammered I, thinking of my trowsers. "That's well, and now let us see what kind of a Latin and Greek lining you have got to your head." So saying, he pointed to a seat by his side, and commenced what I considered a very formidable examination, with the view of eliciting the extent of my acquaintance with the writers of Antiquity, which proved to be extremely select. When he had thoroughly satisfied (or dissatisfied) himself upon this point, he recommended Horace and Xenophon to my particular notice, adding, that Coleman was also directing his attention to the sayings and doings of the same honourable and learned gentlemen,—and that, therefore, we were to work together. He then explained to me certain rules and regulations of his establishment, to which he added a few moral remarks, conveying the information, that, if I always did exactly what he considered right, and scrupulously avoided every thing he deemed wrong, I might relieve my mind from all fears of his displeasure, which was, to say the least, satisfactory, if not particularly original. Exactly as the clock struck one, Dr. Mildman left the room, (the morning's "study," as it was called, ending at that hour,) leaving us our own masters till five, at which time we dined. Lest any kind reader should fancy we were starved, let me add, that at half-past one a substantial luncheon was provided, of which we might partake or not as we pleased. As well as I remember, we generally did incline towards the demolition of the viands, unless "metal more attractive" awaited us elsewhere—but I am digressing.

"Pray, Fairleigh, what did you mean by not coming down till eleven o'clock?" asked Cumberland, in an angry tone. "Did its mamma say it was always to have its breakfast in bed, a dear?" sneered Lawless. "When she fastened that pretty square collar round its neck," chimed in Coleman. "Just like a great gal," added Mullins. "Mildman was exceedingly angry about it, I can tell you," continued Cumberland, "and desired me to speak seriously to you on the subject; such abominable idleness is not to be tolerated." "It was not idleness," answered I, warmly; "you all know, very well, why I could not come down, and I don't think it was at all right or kind of you to play me such a trick." "Eh,—now don't say that,—you will hurt my feelings;"

I declare it is quite affecting," said Coleman, wiping his eyes with Mullins's handkerchief, of which he had just picked his pocket. "I'd have given five pounds to have seen old Sam's phiz, when he was trying to make out what ailed young stupid here, whether he was really ill, or only shamming," said Lawless; "depend upon it, he thinks it was all pretence, and he can't bear any thing of that sort; that was why he began spinning him that long yarn about 'meriting his approbation by upright and straightforward conduct,' this morning. I saw what the old boy was aiming at in a minute; there's nothing puts him out so much as being deceived." "Won't he set him all the hard lines to construe that's all," said Mullins. "It will be 'hard lines' upon him if he does," observed Coleman. "Hold your tongue, Freddy! your puns are enough to make one ill," said Cumberland. "Well, I don't know whether you are going to stand here all day, baiting young pinafore, Cumberland?" interrupted Lawless; "I'm not, for I've got a horse waiting for me down at Snaffles's, and I am going to ride over to Hookley; there's a pigeon-match coming off to-day between Clayton, of the lancers—(he was just above me at Eton,—you know,) and Tom Horton, who won the great match at Finchley, and I have backed Clayton pretty heavily,—shall you come?" "No," replied Cumberland; "no, I am going down to F— Street." "As usual, the board of green cloth, eh? you will go there once too often, if you don't mind, old fellow." "That's my look out," replied Cumberland;—and away they went to their different pursuits, each, as he left the room, making me a very low obeisance; and Coleman taking the trouble to open the door again after he had gone out, to beg, "that if I were going to write to my mother, I would tell her, with his love, that she need not make herself in the least uneasy, as *he had quite* got over his last little attack." In a few minutes they had all quitted the house, and I remained the sole tenant of the pupils' room.

Many a long year has passed over my head since the day I am now describing, and each (though ~~my~~ life has been on the whole as free from care as that of most of the sons of Adam) has brought with it some portion of sorrow or suffering, to temper the happiness I have enjoyed, and teach me the much required lesson, that "here we have no abiding place." I have lived to see bright hopes fade, high and noble aspirations fall to the ground, checked by the sordid policy of worldly men, and the proud hearts which gave them birth become gradually debased to the level of those around them, or break in the unequal struggle,—and these things have pained me. I have beheld those dear to me stretched upon the bed of sickness, and taken from me by the icy hand of death, and have deemed, as the grave closed over them, that my happiness, as far as this world was concerned, was buried with them. I have known (and this was grief indeed) those loved with all the warm and trustful confidence of youth, prove false and unworthy of such deep affection, and have wished, in the bitterness of my soul, that the pit had shut her mouth upon me also, so that I had died with my faith in them unshaken. Still, although such sorrows as these may have produced a more deep and lasting effect upon me, I do not remember ever to have felt more thoroughly desolate than upon the present occasion. The last scene, though trifling in itself, had made a great impression upon me, from the fact, that it proved, as I considered, the animus of the pupils towards me. "Every man's hand was against me." Even the oaf Mullins might insult me with impunity; secure that, in so doing, if in nothing else, he would be supported by the rest. Then I had offended my tutor, all my predilections in whose favour had returned with double force, since I had satisfied myself that he was not addicted to the commission of petty larceny; offended him by allowing him to suppose that I had practised a mean deception upon him. Moreover it was impossible to explain my conduct to him without showing up Coleman, an extreme measure

for which I was by no means prepared. Besides, every one would think, if I were to do so, that I was actuated by a paltry spirit of malice, and that would have been worse to bear than any thing. No—turn my gaze to whichever side I would, the horizon seemed alike clouded; there was no comfort for me any where. I looked at my watch—two o'clock! Three long hours to dinner time, in which I might do what I liked. *What I liked!* there was mockery in the very sound. What was there for me to do? go out and see more new faces looking coldly on me, and wander up and down in strange places alone, amidst a crowd? No! I had not the heart to do that. Sit down, and write home, and by telling them how miserable I was, render them unhappy too? that was worst of all. At length I found a book, and began reading as it were mechanically, but so little was I able to fix my attention, that had I been questioned at the end of the time as to the subject of the work I had been perusing, I should have been utterly at a loss for an answer. I had fairly given it up as hopeless, and closed the book, when I heard footsteps in the passage, followed by the sudden apparition of the ever-smiling Mr. Frederick Coleman, who, closing the door after him, accosted me as follows:—"What, Fairleigh, all in the downs, old fellow? 'never say die'; come, be jolly,—look at me." As he said this, I involuntary raised my eyes to his features, and certainly, if ever there were a face formed for banishing blue devils by a glance, it was his. It was a round face, not remarkable for beauty of outline, inasmuch as it bore a strong resemblance to that of the gentleman on the blue China plates, in two pigtails and a petticoat, who appears to pass a mild ornithological and botanical existence in studying intently the two flashy-looking birds, and the cannon ball tree, which form the leading features of the landscape in his vicinity. With regard to expression, however, Coleman had a decided advantage over the Chinese horticulturist, for, whereas the countenance of the latter gentleman expressed (if indeed it could be said to express any thing) only meek astonishment, Coleman's small black eyes danced and sparkled with such a spirit of mischief and devilry, while such a fund of merriment, and, as it now for the first time struck me, of good-nature also, lurked about the corners of his mouth, that it seemed impossible to look at him without feeling that there was something contagious in his hilarity. "Why," said I, "every thing here is so new to me, so entirely different from all I have been accustomed to before, and the unkind—that is, the odd way in which Lawless and the rest of you seem to behave to me, treating me as if you thought I was either a fool or a baby,—it all seems so strange, that I confess I am not over happy." "Very odd if you were, I think," replied Coleman, "and it was a horrid shame of me to hide your trowsers, as I did this morning. Oh! how cold you did look, as you stood shivering up in the cold. I'm sorry for it now, but I'm such a chap for a bit of fun, that, if a trick like that comes into my head, do it I must—oh! I get into no end of scrapes that way. Why it was but the other day I put a piece of cobbler's wax upon the seat of Mildman's chair, and ruined his best Sunday-going sit-upons; he knew, too, who did it, I'm sure, for the next day he gave me a double dose of Euclid, to take the nonsense out of me, I suppose; he had better mind what he's at, though; I have got another dodge ready for him if he does not take care; but I did not mean to annoy you, and you behaved like a brick, too, in not saying any thing about it,—I am really very sorry." "Never mind," said I, "it's all right again now: I like a joke as well as any body when I know it's only fun; the thing I am afraid of now is, that Dr. Mildman may think I wanted to deceive him, by pretending to be ill, when I was not." "I dare say he has got a pretty good notion how it is," said Coleman, "but we'll get Thomas to tell him what I was up to, and that will set it all straight again." "That will be very

kind, indeed," replied I, "but will not Dr. Mildman be angry with you about it?" "Not he," said Coleman, "he never finds fault unless there's real necessity for it; he's as good a fellow as ever lived, is old Sam, only he's so precious slow." "I am glad you like him, he seems so very kind and good-natured," said I, "just the sort of person one should wish one's tutor to be. But about Cumberland and Lawless; what kind of fellows are they when you come to know them?" "Oh, you will like Lawless well enough when he gets tired of bullying you," replied Coleman, "though you need not stand so much of that as I was obliged to bear; you are a good head taller than I am,—let's look at your arm; it would be all the better for a little more muscle, but that will soon improve. I'll put on the gloves with you for an hour or so of a day." "Put on the gloves!" repeated I, "how do you mean? what has that to do with Lawless?" "Oh you muff, don't you understand? of course I mean the boxing-gloves; and when you know how to use your fists, if Lawless comes it too strong, slip into him." "He must bully a good deal before I am driven to that," replied I, "I never struck a blow in anger in my life." "You will see, before long," rejoined Coleman, "but at all events there's no harm in learning to use your fists; a man should always be able to defend himself if he is attacked." "Yes, that's very true," observed I, "but you have not told me any thing of Cumberland—shall I ever like him, do you think?" "Not if you are the sort of fellow I take you to be," replied he; "there's something about Cumberland not altogether right, I fancy; I'm not very straight-laced myself, particularly if there's any fun in a thing, not so much so as I should be, I suspect; but Cumberland is too bad even for me; besides, there's no fun in what he does, and then he's such a humbug,—not straightforward and honest, you know. Lawless would not be half such a bully either, if Cumberland did not set him on. But don't you say a word about this to any one; Cumberland would be ready to murder me, or to get somebody else to do it for him—that's more in his way." "Do not fear my repeating any thing told me in confidence," replied I, "but what do you mean when you say there's something wrong about Cumberland?" "Do you know what Lawless meant by the 'board of green cloth' this morning?" "No,—it puzzled me." "I will tell you then," replied Coleman, sinking his voice almost to a whisper,—“the billiard table!” After telling me this, Coleman, evidently fearing to commit himself further with one of whom he knew so little, turned the conversation, and, finding it still wanted more than an hour to dinner, proposed that we should take a stroll along the shore together. In the course of our walk, I acquired the additional information that another pupil was expected in a few days,—the only son of Sir John Oaklands, a baronet of large fortune in Hertfordshire; and that an acquaintance of Coleman's, who knew him, said he was a capital fellow, but very odd,—though in what the oddity consisted did not appear. Moreover, Coleman confirmed me in my preconceived idea, that Mullins's genius lay at present chiefly in the eating, drinking, and sleeping line,—adding that, in his opinion, he bore a striking resemblance to those somewhat dissimilar articles,—a muff and a spoon. In converse such as this the time slipped away, till we suddenly discovered that we had only a quarter of an hour left in which to walk back to Langdale Terrace, and prepare for dinner; whereupon a race began, in which my longer legs gave me so decided an advantage over Coleman, that he declared he would deliver me up to the tender mercies of the "Society for the Prevention of Cruelty to Animals," for what he was pleased to call "an aggravated case of over-driving a private pupil."

THE GROACH OF THE ISLE OF LOK.¹*A Legend of the country of Léon. (2)*

EVERY one who knows the *land of the Church* (Lanillis), knows also that it is one of the loveliest parishes in the diocese of Léon. To say nothing of green crops and corn, its orchards are famed from all time for apples sweeter than the honey of Sizun, and plum-trees, of which every blossom ripens into fruit. As for the marriageable maidens, they are all models of discretion and housewifery; at least so say their nearest relations, who of course know them best.

In olden times, when miracles were as common in these parts as christenings and burials now, there dwelt in Lanillis a young man, called Houarn Pogamm, and a damsel, whose name was Bellah Postik. They were akin, at some little distance, and their mothers had cradled them together in their infancy, as they do there with children that are destined, with God's blessing, to become man and wife.²

They grew up together in love, as in age and stature; but every one that they had to care for them being dead, one after the other, and they left portionless, the two poor orphans were at last obliged to go into service. They ought indeed to have been happy, for they served the same master; but lovers are like the sea, that murmurs ever.

"If we only had enough to buy a little cow and a lean pig," said Houarn, "I would take a bit of land of our master, and then the good father should marry us, and we would go and live together."

"Yes," replied Bellah, with a deep sigh, "but the times are so hard! The cows and pigs were dearer than ever at Ploudalmerzean the last fair! Providence must surely have given up caring for the world!"

"I am afraid we shall have to wait a long time," said the young man, "for I never get the last glass of the bottle when I drink with the rest of them."

"Very long," replied the maiden; "for I never can hear the cuckoo."

Day after day it was the same story; till at last Houarn was quite out of patience. So one morning he came to Bellah, as she was winnowing some corn in the threshing-floor, and told her how he had made up his mind that he would set out on his travels to seek his fortune.

Sadly troubled was the poor girl at this resolve, and she said all she could to dissuade him from it; but Houarn, who was a determined young fellow, would not be withheld.

"The birds," said he, "fly hither and thither till they have found a field of corn, and the bees till they meet with flowers that may yield them honey; is it for man to be less reasonable than the winged creatures? I also will go forth on my quest; what I want is but the price of a little cow and a lean pig. If you love me, Bellah, you will no longer oppose a project which is to hasten our marriage."

Bellah could not but acknowledge that there was reason in his words; so with a sigh and a yearning heart she said,—“Go, then, Houarn, with God's blessing, if it must be so; but first let me share with you my family relics.”

(1) The name Groach'h, or Grac'h, means literally *old woman*, and was given to the Druidesses who had established themselves in an island off the south-west coast of Brittany, called thence the Isle of Groach'h, by corruption Groais, or Groix. But the word gradually lost its original meaning of old woman, and came to signify a woman endowed with power over the elements, and dwelling amongst the waves, as did the island Druidesses; in fact, a sort of water-fay, but of a malevolent nature, like all the Breton fairies. Such of our readers as are not acquainted with La Motte Fouqué's beautiful tale of Undine, may require to be reminded that the sprites, sylphs, gnomes, and fairies, of the popular mythologies, are not necessarily, perhaps not even generally, exempt from mortality.

(2) *Vide* the head-note to the tale of Robin Redbreast, in No. 7, p. 100.

(3) This custom exists throughout Cornouaille. The children destined for each other are laid, from their birth, in the same cradle.

She led him to her press, and took out a little bell, a knife, and a staff.

"There," said she, "these are immemorial heir-looms of our family. This is the bell of St. Kolodok. Its sound can be heard at any distance, however great, and will give immediate notice to the possessor's friends should he be in any danger. The knife once belonged to St. Corentin, and its touch dissolves all spells, were they of the arch-fiend himself. Lastly, here is the staff of St. Vouga, which will lead its possessor whithersoever he may desire to go. I will give you the knife to defend you from enchantments, and the little bell to let me know if you are in peril; the staff I will keep, that I may be able to join you should you need my presence."

Houarn accepted with thanks his Bellah's gifts, wept awhile with her, as belongs to a parting, and set out towards the mountains.

But it was then just as it is now, and in all the villages through which he passed, the traveller was beset by beggars, to whom any one with whole garments was a man of rank and fortune.

"By my faith," thought he, "this part of the country seems fitter for spending a fortune than for making one; I must go farther."

He went onwards therefore towards the west, till at last he arrived at Pontaven, a pretty town, built upon a river bordered with poplars.

There, as he sat at the inn-door, he overheard two carriers, who, as they loaded their mules, were talking together of the Groac'h of the Isle of Lok.

Houarn inquired who or what that might be, and was told that it was the name of a fairy, who inhabited the lake in the largest of the Glénans,¹ and who was said to be as rich as all the kings of the earth together. Many had been the treasure-seekers that had visited her island, but not ever had one of them returned.

The thought came suddenly into Houarn's mind that he too would try the adventure. The muleteers did all they could to dissuade him. They were so loud in their remonstrances, that they collected quite a crowd about him, crying out that it was downright unchristian to let him run into destruction in that way, and the people would even have kept him back by force. Houarn thanked them for the interest they manifested in his welfare, and declared himself ready to give up his design, if only they would make a collection amongst them which would enable him to buy a little cow and a lean pig: but at this proposition the muleteers and all the others drew back, simply repeating that he was an obstinate fellow, and that it was of no use talking to him. So Houarn repaired to the sea-shore, where he took a boat, and was carried to the Isle of Lok.

He had no difficulty in finding the pond, which was in the centre of the island, its banks fringed by sea plants with rose-coloured flowers. As he walked round, he saw lying at one end of it, shaded by a tuft of broom, a sea-green canoe, which floated on the unruffled waters. It was fashioned like a swan asleep, with its head under its wing.

Houarn, who had never seen anything like it before, drew nearer with curiosity, and stepped into the boat that he might examine it the better; but scarcely had he set foot within it, than the swan seemed to awake, its head started from amongst the feathers, its wide feet spread themselves to the waters; and it swam rapidly from the bank.

The young man gave a cry of alarm, but the swan only made the more swiftly for the middle of the lake; and just as Houarn had decided on throwing himself from his strange bark, and swimming for the shore, the bird plunged downwards, head foremost, drawing him under water along with it.

(1) A cluster of islets off the southern coast of Brittany, near the headland of Penmarc'h. The name signifies literally *summer-land*. One of them is called the Isle of Lok, or Lock, and contains a fish pool, from which it seems to derive its name.

The unfortunate Léonard, who could not cry out without gulping down the unsavoury water of the pool, was silent by necessity, and soon arrived at the Groac'h's dwelling.

It was a palace of shells, far surpassing in beauty all that can be imagined. It was entered by a flight of crystal steps, each stair of which, as the foot pressed it, gave forth a concert of sweet sounds, like the song of many birds. All around stretched gardens of immense extent, with forests of marine plants, and plots of green seaweed, spangled with diamonds in the place of flowers.

The Groac'h was reclining in the entrance hall upon a couch of gold. Her dress was of sea-green silk, exquisitely fine, and floating round her like the waves that wrapped her grotto. Her black locks, intertwined with coral, descended to her feet, and the white and red of her brilliant complexion blended as in the polished lining of some Indian shell.

Dazzled with a sight at once so fair and unexpected, Houarn stood still, but with a winning smile the Groac'h rose, and came forward to meet him. So easy and flowing were her movements, that she seemed like a snowy billow heaving along the sea, as she advanced to greet the young Léonard.

"You are welcome," said she, beckoning him with her hand to enter; "there is always room here for all comers, especially for handsome young men."

At this gracious reception Houarn somewhat recovered himself, and entered the hall.

"Who are you? Whence come you? What seek you?" continued the Groac'h.

"My name is Houarn," replied the Léonard; "I come from Lanillis; and I am in quest of the wherewithal to buy a little cow and a lean pig."

"Well, come in, Houarn," said the fairy, "and dismiss all anxiety from your mind; you shall have every thing to make you happy."

While this was passing she had led him into a circular hall, the walls of which were covered with pearls, where she set before him eight different kinds of wine, in eight goblets of chased silver. Houarn made trial of all, and found all so much to his taste that he repeated his draught of each eight times, while ever as the cup left his lips, the Groac'h seemed still fairer than before.

She meanwhile encouraged him to drink, telling him he need be in no fear of ruining her, for that the lake in the Isle of Lok communicated with the sea, and that all the treasures swallowed up by shipwrecks were conveyed thither by a magic current.

"I do not wonder," cried Houarn, emboldened at once by the wine and the manner of his hostess, that the people on shore speak so badly of you; in fact, it just comes to this, that you are rich, and they are envious. For my part, I should be very well content with the half of your fortune."

"It shall be yours if you will, Houarn," said the fairy.

"How can that be?" he asked.

"My husband, the Korandon, is dead," she answered, "so that I am now a widow; if you like me well enough, I will become your wife."

Houarn quite lost his breath for very wonderment. For him to marry that beautiful creature! to dwell in that splendid palace! and to drink to his heart's content of the eight sorts of wine! True, he was engaged to Bellah; but men easily forget such promises,—indeed, for that they are just like women. So he gallantly assured the fairy that one so lovely must be irresistible, and that it would be his pride and joy to become her husband.

Thereupon the Groac'h exclaimed that she would forthwith make ready the wedding feast. She spread a table, which she covered with all the delicacies that the Léonard had ever heard of, besides a great many unknown to him even by name; and then proceeding to a little fish-pond at the bottom of the garden, she began to call,—“Now, attorney! now, miller! now,

tailor! now, Mr. Dean!" And at each call up swam a fish, which she successively caught in a steel net. When the net was full, she carried it into the next room, and threw all the fish into a golden frying-pan.

But it seemed to Houarn as though there was a whispering of little voices amidst the hissing of the pan.

"What is that whispering in the frying-pan, Groach'h?" he asked.

"It is the crackling of the wood," said she, stirring the fire.

An instant after the little voices again began to murmur.

"What is that murmuring, Groach'h?" asked the bridegroom.

"It is the butter in the frying-pan," she answered, giving the fish a toss.

But soon the little voices cried yet louder.

"What is that cry, Groach'h?" said Houarn.

"It is the cricket in the hearth," replied the fairy, and she began to sing, so that the Léonard could no longer hear anything but her voice.

But he could not help thinking on what he had noticed: and thought brought fear, and fear, of course, repentance.

"Alas!" he cried, "can it then be possible that I have so soon forgotten Bellah for this Groach'h, who is no doubt a child of Satan! With her for my wife, I shall not even dare to say my prayers at night, and shall be as sure to go to hell as an exciseman."

While he thus communed with himself, the fairy brought in the fried fish, and pressed him to eat, while she went to fetch him twelve new sorts of wine.

Houarn sighed, took out his knife, and prepared to begin; but scarcely had the spell-destroying blade touched the golden dish, than all the fish rose up in the form of little men, each one clad in the proper costume of his rank and occupation. There was a lawyer with his bands; a tailor in blue stockings; a miller all white with flour; a reverend dean in full canonicals; and all crying out at once, as they swam in the melted butter,—

"Houarn, save us, if thou wouldst thyself be saved!"

"Holy Virgin! what are these little men singing out from amongst the melted butter?" cried the Léonard, in bewilderment.

"We are Christians like thyself," they answered. "We, too, came to seek our fortunes in the Isle of Lok; we, too, consented to marry the Groach'h; and the day after the wedding she did with us as she had done with all our predecessors, of whom the fish-pond in the garden is full."

"What!" cried Houarn, "a creature that looks so young already the widow of this multitude of fishes?"

"And thou wilt soon be in the same condition; subject thyself to be fried and eaten by some new comer."

Houarn gave a jump, as though he felt himself already in the golden frying-pan, and ran towards the door, thinking only how he might escape before the Groach'h should return. But she was already there, and had heard all; her net of steel was soon thrown over the Léonard, who found himself instantly transformed into a frog, in which guise the fairy carried him to the fish-pond, and threw him in, to keep her former husband's company.

At this moment the little bell, which Houarn wore round his neck, tinkled of its own accord, and Bellah heard it at Lanillis, where she was busy skimming the last night's milk.

The sound struck upon her heart like a funeral knell; and she cried aloud,—*"Houarn is in danger!"* And without a moment's delay, without asking counsel of any as to what she should do, she ran and put on her Sunday clothes, her shoes and silver cross, and set out from the farm with her magic staff. Arrived where four roads met, she set the stick upright in the ground, murmuring in a low voice,—

"List, thou crab-tree staff of mine!
By good St. Vouga hear me!
O'er earth and water, through air, 'tis thine
Whither I will to bear me!"

And lo! the stick became a bay nag, a right roadster of St. Thegonec, dressed, saddled, and bridled, with a rosette behind each ear, and a blue feather in front.

Bellah mounted without the slightest hesitation, and the horse set forward; first at a walking pace, then he trotted, and at last galloped, and that so swiftly, that ditches, trees, houses, and steeples passed before the young girl's eyes like the arms of a spindle. But she complained not, feeling that each step brought her nearer to her dear Houarn; nay, she rather urged on her beast, saying,—

"Less swift than the swallow is the horse, less swift the swallow than the wind, the wind than the lightning; but thou, my good steed, if thou lovest me, outstrip them all in speed; for a part of my heart is suffering; the better half of my own life is in danger."

The horse understood her, and flew like a straw driven by the whirlwind, till he arrived in the country of Arhés, at the foot of the rock called the Stag's Leap. But there he stood still, for never had horse foaled of mare scaled that precipice. Bellah, perceiving the cause of his stopping, renewed her incantation, saying—

"Once again, thou courser mine,
By good St. Vouga hear me!
O'er earth and water, through air, 'tis thine
Whither I will to bear me!"

She had hardly finished, when a pair of wings sprang from the sides of her horse, which now became a great bird, and in this shape flew away with her to the top of the rock.

Strange indeed was the sight that here met her eyes. Upon a nest made of potter's clay and dry moss, squatted a little korandon,¹ all swarthy and wrinkled, who, on beholding Bellah, began to cry aloud,—

"Hurry! Here is the pretty maiden come to save me!"

"Save thee?" said Bellah. "Who art thou, then, my little man?"

"I am Grannik, the husband of the Groach'h of the Isle of Lok. She it was that sent me here."

"But what art thou doing in this nest?"

"I am sitting on six stone eggs, and I cannot be free till they are hatched."

Bellah could not keep herself from laughing right out.

"Poor little dear!" said she; "and how can I deliver thee?"

"By saving Houarn, who is in the Groach'h's power."

"Ah, tell me how I may do that!" cried the orphan girl, "and not a moment will I lose in setting about my part in the matter, though I should have to make the circuit of the four dioceses upon my bare knees."

"Well, then, there are two things to be done," said the korandon. "The first, to present thyself before the Groach'h as a young man; and the next, to take from her the steel net which she carries at her girdle, and shut her up in it till the day of judgment."

"And where shall I get a suit of clothes to fit me, Korandon, my darling?"

"Thou shalt see, my pretty one."

With these words the little dwarf pulled out four hairs from his foxy poll, and blew them to the winds, muttering something in an under tone, and lo! the four hairs became four tailors, of whom the first held in his hand a cabbage, the second a pair of scissors, the third a needle, and the last a smoothing goosic. All the four seated themselves cross-legged round the nest, and began to prepare a suit of clothes for Bellah.

Out of one cabbage-leaf they made a beautiful coat, laced at every seam; of another they made a waistcoat; but it took two leaves for the trunk breeches, such as are worn in the country of Léon; lastly, the heart of

(1) A dwarfish sprite. See Illustration, p. 17.

the cabbage was shaped into a hat, and the stalk was converted into shoes.

Thus equipped, Bellah would have passed anywhere for a handsome young gentleman, in green velvet lined with white satin.

She thanked the korandon, who added some further instructions, and then her great bird flew away with her straight to the Isle of Lok. There she commanded him to resume the form of a crab-stick; and entering the swan-shaped boat arrived safely at the Groach's palace.

The fairy was quite taken at first sight with the velvet clad young Léonard.

"Well," quoth she to herself, "you are the best looking young fellow that has ever come to see me; and I do think I shall love you for three times three days."

And she began to make much of her guest, calling him her darling, and heart of hearts. She treated her with a collation, and Bellah found upon the table St. Corentin's knife, which had been left there by Houarn. She took it up against the time of need, and followed the Groach into the garden. There the fairy showed her the grass-plots, flowered with diamonds, the fountains of perfumed waters, and, above all, the fish-pond, wherein swam fishes of a thousand colours.

With these last Bellah made to be especially taken, so that she must needs sit down upon the edge of the pond, the better to enjoy the sight of them.

The Groach took advantage of her manifest delight to ask her if she would not like to spend all her days in this lovely place. Bellah replied that she should like it of all things.

"Well, then, so you may, and from this very hour, if you are only ready at once to marry me," proceeded the fairy.

"So I will," replied Bellah; "but you must let me fetch up one of these beautiful fishes with the steel net that hangs at your girdle."

The Groach, nothing suspecting, and taking this request for a mere boyish freak, gave her the net, saying with a smile, "Let us see, fair fisherman, what you will catch."

"Thee, fiend!" cried Bellah, throwing the net over the Groach's head. "In the name of the Saviour of men, accursed sorceress, become in body even as thou art in soul."

The cry uttered by the Groach died away in a stifled murmur, for the exorcism had already taken effect; the beautiful water fay was now nothing more than the hideous queen of toadstools.

In an instant Bellah drew to the net, and with all speed threw it into a well, upon which she laid a stone, sealed with the sign of the cross, that it might remain closed till the tombs shall be opened at the last day.

She then hastened back to the pond, but all the fish were already out of it, coming forth to meet her, like a procession of many coloured monks, crying in their little hoarse voices, "Behold our lord and master! who has delivered us from the net of steel, and the golden frying-pan."

"And who will also restore you to your shape of Christians," said Bellah, drawing forth the knife of St. Corentin. But as she was about to touch the first fish, she perceived close to her a green frog, with the magic bell hung about his neck, and sobbing bitterly as he knelt before her, his two little paws pressed upon his tiny heart. Bellah felt her bosom swell, and she exclaimed,—"Is it thou, is it thou, my Houarn, thou lord of my sorrow and my joy?"

"It is I," answered the befrogged youth.

At a touch with the potent blade he recovered his proper form, and Bellah and he fell into each other's arms, the one eye weeping for the past, the other glistening with the present joy.

She then did the like for all the fishes, who were restored each of them to his pristine shape and condition.

The work of disenchantment was hardly at an end, when up came the little korandon from the Stag's Leap rock, drawn in his nest, as in a chariot, by six great cockchafers, which had just been hatched from the six eggs of stone.

"Here I am, my pretty maiden," cried he to Bellah: "the spell which held me where you saw me is broken, and I am come to thank you, for from a hen you have made me a man again."

He then conducted the lovers to the Groach's coffers, which were filled with precious stones, of which he begged them to take as many as they pleased.

They both loaded their pockets, their girdles, their hats, and even their great trunk breeches; and when they had as much as they could possibly carry, Bellah commanded her staff to become a winged chariot, of sufficient size to convey them to Lanillis, with all whom she had delivered from the enchantment.

The banns were soon published, and Houarn married his Bellah, as he had so long desired. But instead of a little cow and a lean pig, he bought all the land in the parish, and put in as farmers the people he had brought with him from the Isle of Lok.

THE POPULAR YEAR-BOOK.

MAY-DAY, concluded from p. 14.

In many parts of the country May-poles may yet be found. The writer of these pages saw one eighty feet high, on the village green of West Dean, Wilts, in the summer of 1836; and another, in a neighbouring parish, at the same period. From an account of a festival in St. James's District, Enfield, 1844, we learn that "there was running in sacks, and running blindfold, jingling, racing, and dancing round the May-pole; while the band played old national airs that our forefathers loved." "In crossing the Trent," says Washington Irving, in his interesting account of his visit to Newstead Abbey, "one seems to step back into old times; and in the villages of Sherwood Forest we are in a black-letter region. The moss-grown cottages, the lowly mansions of grey-stone, the Gothic crosses at each end of the villages, and the tall May-pole in the centre, transport us, in imagination, to foregone centuries. Every thing has a quaint and antiquated air." Upon this, Mr. Howitt observes:—"There is certainly a May-pole standing in the village of Linby, near Newstead, and there is one in the village of Farnsfield, near Southwell; but I have been endeavouring to recollect any others for twenty miles round, and cannot do it; and though garlands are generally hung on these poles on May-day, wreathed by the hands of some fair damsel, who has a lingering affection for the elden times, and carried up by some adventurous lad, alas! the dance beneath it, where is it? In the dales of Derbyshire, May-poles are more frequent, but the dancing I never saw." The late Dr. Parr was a patron of May-day festivities. Opposite his parsonage-house at Hatton, near Warwick, on the other side of the road, stood the parish May-pole, which, on the annual festival, was dressed with garlands, and surrounded by a numerous band of villagers. The Doctor was "first of the throng," and danced with his parishioners the gayest of the gay. He kept the large crown of the May-pole in the closet of his house, from whence it was produced every May-day, with fresh flowers and streamers, preparatory to its elevation, and to the Doctor's own appearance in the ring. He always spoke of this festivity as one wherein he joined with peculiar delight to himself, and advantage to his neighbours.

"A certain superstitious feeling," says Mr. Chambers, "attached to May-day. The dew of that morning was considered as a cosmetic of the highest efficacy; and women used to go abroad, before sunrise, to gather it. Maidens, also, threw it over their shoulder, in order to propitiate Fate in allotting them a good husband. In the *Morning Post*, May 2, 1791, it was mentioned that,

"yesterday, according to annual custom, a number of persons went into the fields, and bathed their faces with the dew on the grass, under the idea that it would make them beautiful." To this day, there is a resort of the fair sex, every May morning, to Arthur's Seat, near Edinburgh, for the same purpose. Mr. Pepys makes this entry in his Diary:—"My wife away to Woolwich, in order to a little air, and to lie there to-night, and so to gather May-dew to-morrow morning, which Mrs. Turner hath taught her is the only thing to wash her face with." Scott, in his "Discovery of Witchcraft," observes,—"To be delivered from witches, they hang in their entries (among other things) hay-thorn, otherwise white-thorn, gathered on May-day." Gay's "Shepherd's Week" describes another " quaint " superstition connected with this festival.

"Last May-day fair, I searched to find a snail,
That might my secret lover's name reveal.
Upon a gooseberry-bush a snail I found,
For always snails near sweetest fruit abound.
I seized the vermin; home I quickly sped,
And on the hearth the milk-white embers spread.
Slow crawled the snail, and if I right can spell,
In the soft ashes marked a curious L.
Oh! may this wondrous omen lucky prove,
For L is found in Lubberkin and Love.
With my sharp heel I three times mark the ground,
And turn me thrice around, around, around."

A description of the festive customs still, or within these few years, remaining on May-day, in different parts of the kingdom, would occupy a number of this Magazine; and, of course, cannot, consequently, be given: yet our "Year Book" would be very incomplete without a brief account of some of the principal of them. There was formerly a practice of making fools on this day, similar to that which obtains on the first of April. The deluded were called *May-goslings*. At Lynn, in Norfolk, the May garlands are made of two hoops of the same size fixed transversely, and attached to a pole or staff, with the end through the centre, and parallel to the hoops; bunches of flowers, interspersed with evergreens, are tied round the hoops, from the interior of which festoons of blown birds' eggs are usually suspended, and long strips of various coloured ribands are also pendant from the top. A doll, full dressed, of proportionate size, is seated in the centre, thus exhibiting an humble representation of *Flora*, surrounded by the "fragrant emblems of her consecrated offerings." These garlands are carried about the town in all directions, each with an attendant group of "juveniles," who blow, in deafening concert, the horns of bulls and cows. Each garland is subsequently dismounted from the staff, and suspended across a court or lane, where the amusement of throwing balls over it, from one to another, generally terminates the day. May-garlands, with dolls, are carried at Northampton by the neighbouring villagers. In Huntingdonshire, the children suspend a sort of crown of hoops, wreathed and ornamented with flowers, ribands, handkerchiefs, necklaces, silver spoons, &c., at a considerable height above the road, by a rope, extending from chimney to chimney of the cottages, and attempt, as at Lynn, to fling their balls over it from side to side, singing, and begging halfpence from the passengers. A doll, or larger figure, "sometimes makes an appendage in some side nook." The money collected is afterwards spent in a tea-drinking, with cakes, &c. At Cambridge, the children formerly had a similar "maulkin," before which they set a table, having wine on it, and begged money, with the supplication, "Pray remember the poor May-lady." As lately as last May-day, a May-pole was set up in a meadow behind the College walks, and the games were excellent. A Maid Marian figured among the dancers, who footed it merrily, till sunset, to the fiddle's jovial sound. "At Oxford," says Aubrey, "the boys do blow cows' horns and hollow canes all night; and on May-day the young maids of every parish carry about garlands of flowers,

which afterwards they hang up in their churches." In this city, also, at the hour of five on May-day morning, the choristers of the College of St. Mary Magdalene assemble on the top of the chapel tower, and sing a Latin hymn, in lieu of a requiem, which, before the Reformation, was performed in the same place for the soul of Henry VII. A singular custom used to be annually observed on May-day by the boys of Frindsbury, and the neighbouring town of Stroud. They met on Rochester bridge, where a skirmish ensued between them. "This combat," Brand remarks, "probably derived its origin from a drubbing received by the monks of Rochester, in the reign of Edward I." At Horncastle, in Lincolnshire, the youths and maidens used to come marching up to the May-pole with wands wreathed with cowslips, which they there struck together in wild enthusiasm, and scattered the flowers in a shower around them. At Padstow, in Cornwall, they have, or had lately, the procession of the hobby-horse. At Hitchin, in Hertfordshire, a large party of the town-people and neighbouring labourers parade the streets, soon after three o'clock in the morning, singing the "Mayer's Song." They carry in their hands large branches of May, and they affix one of these upon the doors of nearly every respectable house. Those of unpopular persons are marked with a bough of elder and a bunch of nettles instead. Throughout the day, parties of these Mayers are seen, dancing and frolicking, in various parts of the town. "The group that I saw to-day," says one of Mr. Hone's correspondents, "was composed as follows:—First came two men with their faces blacked, one of them with a birch broom in his hand, and a large artificial hump on his back; the other dressed as a woman, all in rags and tatters, with a large straw bonnet on, and carrying a ladle; these are called 'Mad Moll, and her husband.' Next came two men, one most fantastically dressed with ribands, and a great variety of gaudy-coloured handkerchiefs, tied round his arms, from the shoulders to the wrists, and down his thighs and legs to the ankles; he carried a drawn sword in his hand; leaning on his arm was a youth, dressed as a fine lady, in white muslin, and profusely bedecked from top to toe with gay ribands; these were called the 'Lord and Lady' of the company. After these followed six or seven couples more, attired much in the same style as the Lord and Lady, only the men were without swords. When this group received a satisfactory contribution at any house, the music struck up from a violin, clarinet, and fife, accompanied by the long drum, and they began the merry dance." While this continued, the principal amusement to the populace was caused by the grimaces and clownish tricks of Mad Moll and her husband. "When the circle of spectators became so contracted as to interrupt the dancers, then Mad Moll's husband went to work with his broom, and swept the road dust all round the circle into the faces of the crowd; and when any pretended affronts were offered to his wife, he pursued the offenders, broom in hand; if he could not overtake them, whether they were males or females, he flung the broom at them." The song intoned by these personages consists of seven religious verses, of great antiquity. It concludes as follows:—

"The life of man is but a span,
It flourishes like a flower;
We are here to-day, and gone to-morrow,
And we are dead in an hour."

"The moon shines bright, and the stars give a light,
A little before it is day;
So God bless you all, both great and small,
And send you a joyful May."

At Great Gandsden, Cambridgeshire, "the farmers' young men-servants," says Mr. Howitt, "go and cut hawthorn, singing what we call the *Night Song*. They leave a bough at each house, according to the number of young persons in it. On the evening of May-day, and the following evening, they go round to every

house where they left a bush, singing *The May Song*. One has a handkerchief on a long wand for a flag, with which he keeps off the crowd. The rest have ribands in their hats." Hutchinson, in his *History of Northumberland*, tells us, "that a syllabus is prepared for the May-feast, which is made of warm milk from the cow, sweet cake, and wine; and a kind of divination is practised, by fishing with a ladle for a wedding ring, which is dropped into it, for the purpose of prognosticating who shall be first married." At Penzance, in Ireland, and in Wales, May dances and observances (to which, we are sorry to say, we have only space to allude,) are still practised.

May 8.—On this day, at Helstone, in Cornwall, is held what is called "the Furry,"—a name supposed by Mr. Polwhele to have been derived from the old Cornish word *fer*, a fair or jubilee. The morning is ushered in by the music of drums and kettles, and other accompaniments of a song "not very comprehensible." So strict is the observance of this day as a general festival, that, should any person be found at work, he is instantly seized, set astride on a pole, and hurried on men's shoulders, amidst thousands of huzzas, to the river, where he is sentenced to leap over a wide place, which he, of course, fails in accomplishing, and jumps into the water. A small contribution, however, towards the expenses of the feast, saves him from this cooling. About nine o'clock, the mob gathers round the various seminaries, and demands a holiday for their youthful inmates, which request is acceded to; a collection from house to house is then commenced, towards the general fund. The "young folks," of both sexes, then *fade* into the country, (fade being an old English word for *go*;) and return at twelve, with flowers and oak branches in their hats and caps. On entering the town, they are joined by a band of music, and dance, hand in hand, through the streets, to the "Flora Tune." In their progress, they enter every house and garden they please, without distinction; all doors are opened, and, in fact, it is thought much of by the householders to be thus favoured.

The *older* branch of the population dance in the same manner; for it is to be noticed, they have select parties, and at different hours; no two sets dance together, or at the same time. "Then follow the gentry, which," says an eye-witness, "is really a very pleasing sight on a fine day, from the noted respectability of this rich borough. In this set, the sons and daughters of some of the first and noblest families of Cornwall join. The appearance of the ladies is enchanting. Added to their personal charms, in ball-room attire, each, tastefully adorned with beautiful spring flowers, in herself appears to the gazer's eye a *Flora*, and leads us to conceive the whole a scene from fairy land." The next set is the soldiers and their lasses; then come the tradesmen and their wives; journeymen and their "sweethearts;" and, "though last not least," the male and female servants, in splendid livery. In the evening a grand ball is always held at the assembly rooms; to which, in 1826, were added the performance of the "Honey-moon," at the theatre, a troop of horse at the circus, and an exhibition of sleight of hand, at the rooms. The borough, on this occasion, was thronged with visitors from all parts of the country. A writer, in 1790, states that at that period the dance round the streets was called a "Faddy." "In the afternoon," he adds, "the gentility go to some farm-house in the neighbourhood, to drink tea, syllabubs, &c., and return in a morris-dance to the town, where they form a Faddy, and dance through the streets till it is dark, claiming a right of going through any person's house—in at one door and out at another. And here it formerly used to end, and the company of all kinds to disperse quietly to their several habitations. . . . The ladies are now conducted by their partners to the ball-room, where they continue their dance till supper time; after which, they all faddy it out of the house, breaking off by degrees to their

respective houses. The mobility imitate their superiors, and also adjourn to the several public-houses, where they continue their dance till midnight." "There is no doubt," says Hone, "of the 'Furry' originating from the 'Floralia,' anciently observed by the Romans on the fourth of the kalends of May."

There is a tradition that St. Michael, the patron saint of Helstone, made his appearance, or apparition, as it is called, on the 8th of May, at St. Michael's Mount, on a rock called his chair. This may have been a reason for making the octave of the May feast, or 9th of May, a marked day at Helstone; and when May-day festivities became obsolete here, as elsewhere, the Furry-day continued to be observed, as at this present time, with much zeal and enjoyment.

THE FRIENDS.¹

Few have lived

As we have lived, unsevered; our young life
Was but a summer's frolic: we have been
Like two babes passing hand in hand along
A sunny bank of flowers. The busy world
Goes on around us, and its multitudes
Pass by me, and I look them in the face,
But cannot read such meaning as I read
In this of thine: and thou too dost but move
Among them for a season, but returnest
With a light step and smiles to our old seats,
Our quiet walks, our solitary bower.
Some we love well; the early presences
That were first round us, and the silvery tones
Of those most far-away and dreamy voices
That sounded all about us at the dawn
Of our young life,—these, as the world of things
Sets in upon our being like a tide,
Keep with us, and are ever uppermost.
And some there are, tall, beautiful, and wise,
Whose step is heavenward, and whose souls have past
Out from the nether darkness, and been born
Into a new and glorious universe,
Who speak of things to come; but there is that
In thy soft eye and long-accustomed voice
Would win me from them all.

For since our birth,

Our thoughts have flowed together in one stream:
All through the seasons of our infancy
The same hills rose about us—the same trees,
Now bare, now sprinkled with the tender leaf,
Now thick with full dark foliage; the same church,
Our own dear village-church, has seen us pray,
In the same seat, with hands clasped side by side;
And we have sung together; and have walked,
Full of one thought, along the homeward lane;
And so were we built upwards for the storm
That on my walls hath fallen unsparingly,
Shattering their frail foundations; and which thou
Hast yet to look for,—but hast found the help
Which then I knew not—rest thee firmly there!

When first I issued forth into the world,
Well I remember that unwelcome morn,
When we rose long before the accustomed hour
By the faint taper-light; and by that gate
We just now swung behind us carelessly,
I gave thee the last kiss:—I travelled on,
Giving my mind up to the world without,
Which poured in strange ideas of strange things,
New towns, new churches, new inhabitants:—
And ever and anon some happy child
Beneath a rose-trailed porch played as I past:

(1) From Poems, by the Rev. H. Alford. London: Burns.

And then the thought of thee swept through my soul,
And made the hot drops stand in either eye :—
And so I travelled—till between two hills,
Two turf-enamelled mounds of brightest green,
Stretched the blue limit of the distant sea,
Unknown to me before :—then with strange joy,
Forgetting all, I gazed upon that sea,
Till I could see the white waves leaping up,
And all my heart leapt with them :—so I past
Southward, and neared that wilderness of waves,
And stopt upon its brink ; and when the even
Spread out upon the sky unusual clouds,
I sat me down upon a wooded cliff,
Watching the earth's last daylight fade away,
Till that the dim wave far beneath my feet
Did make low moanings to the infant moon,
And the lights twinkled out along the shore ;
Then I looked upwards, and I saw the stars,

Sirius, Orion, and the Northern wain,
And the Seven Sisters, and the beacon-flame
Of bright Arcturus,—every one the same
As when I shewed them thee.—“ But yesternight,”
I said, “ she gazed with me upon those stars :
Why did we not agree to look on them
Both at one moment every starlight night,
And think that the same star beheld us both ? ”

SELF-CULTIVATION.

WHAT is our precise meaning when we speak of a man's cultivating himself? And is the power which we ascribe to him in using these words a reality or a delusion?

In the primary use of the word "cultivate," it bears two distinct, and broadly distinguished, significations. We say that we cultivate the ground, by which we mean that we prepare and labour the ground, removing those things which obstruct the exercise of its natural powers, and applying such things as our experience has taught us will stimulate and strengthen them, so that it may most effectually put them forth in the production

of fruits and plants from the seed which is committed to it. This is one, and perhaps the original use of the word. But we also say that we cultivate the plants and fruits themselves; and by that we mean that, applying our labour and skill to cause them to be produced in as great perfection as possible, we thereby effect a progressive improvement, more or less marked, in their character and qualities. We know from experience that we can do this; that improvement in the quality of any product of the earth is the unfailing result of continued and judicious cultivation; and so uniform and certain is this result, that we have come to express our conviction

tion of its certainty in the very word which we use to denote the effort to arrive at it. We have caused the word "cultivate," as applied to any product of the earth, to mean not merely the endeavour to produce it, but the improvement in its quality, which is the invariable consequence of that endeavour, when sufficiently sustained and rightly directed. When we speak of a man's cultivating the apple, we do not mean merely that he causes apples to grow, or that he goes on producing year after year, unimproved, the sour crab which, we believe, was the original progenitor of all the varieties of that excellent fruit; we mean that he is carrying on the process, which has already had the effect of converting the diminutive and useless crab into the valuable and delicious fruit, which, in such varied profusion, adorns and enriches our orchards.

In passing from the primary signification of the word "cultivate," as expressing the physical processes intended to affect the operations of the earth in the production of fruits, to its application to analogous operations upon our moral and intellectual powers, we shall not here attempt to follow out the distinction we have drawn between its two significations, to the extent of separating that operation which corresponds to the cultivation of the ground, from that which corresponds to the cultivation of its fruits. We believe both to be more or less implied in every application of the word to the moral discipline which our minds undergo. But of far more importance than any amount of success in drawing fine metaphysical or logical distinctions between any of the operations of our minds, or the terms by which it may be right to describe them, is the discovery, and application to our conduct in life, of the practical lesson to be drawn from the fact, that a word descriptive of physical processes carried on every day under our eyes, and the mode of whose operation, or at least the external machinery by which they are conducted to the desired results, is the subject of actual observation, has been, by that general consent of mankind, more unerring by far than the most refined speculations of philosophy, which alone can give currency to any particular acceptance of a word, transferred to functions of our invisible and spiritual part, of which our senses can take no cognizance, and of which, without the aid of such material analogies, we should have a very dim and indistinct conception.

A common understanding of the expression "self-cultivation," is that it means something similar to "self-education;" that is, that we conduct the moral and intellectual training of our minds for ourselves, instead of leaving it to be done by others. But this, though undoubtedly implied in it, is only a part, and the least important part of its meaning; it points to the agent merely; it leaves unexplained the thing done, and it presents no indication of the means by which it is to be done. These we find in the analogy furnished by the more extended use of the word "self-cultivation" for which we contend, namely that, when we speak of *self-cultivation*, we mean a man's cultivating himself, implying thereby that, in so doing, he effects upon himself an improvement analogous to that which, by the judicious employment of the means suggested by experience, the cultivator of any plant or fruit effects upon its nature and qualities.

Do we possess such a power? Can we so cultivate ourselves? Can we regulate the growth of our moral and intellectual powers, so as, in the end, to give the preponderance of strength to such of them as will constitute us beings largely improved in true nobility of nature? Such a question, if we have any means whatever of answering it, is unquestionably one of the most important which can be addressed to the mind of man.

It would appear to be a law of our nature—it certainly is so in the case of our bodily frame—that our ability to perform any act is increased by each effort that we make to perform it. We do not say this merely in reference to the increased skill which practice always confers, but to the increased power of the organs em-

ployed. Workmen, the nature of whose employment brings a particular set of muscles constantly into play, acquire a degree of strength in those muscles which is truly astonishing, and altogether out of proportion to the general strength of their bodies. The arm of a blacksmith, for example, though he may be in other respects no stronger than ordinary men, becomes, by the continual use which he is obliged to make of it, a weapon as formidable as the ponderous fore-hammer which he wields as if it were a child's toy. In all other employments it is the same. Those muscles, which are most frequently brought into exercise, become developed to an extent much beyond the general growth of the body.

On the other hand, where any particular set of muscles are kept in an unnatural condition of inactivity, they are left behind the rest of the body in its advancement to maturity of strength. The experience of most men can furnish abundant illustrations of this fact. A limb, so distorted at birth, or by early accident, as to make the natural use of it impossible, or difficult and painful, and which in consequence is never or seldom used, remains through life in a condition of the most helpless feebleness. This is the reason—we know of no other—why, in the case of the generality of men, the left hand is weaker than the right. The general inclination to use the right hand in preference to the left, to whatever cause it may be owing, and the consequently greater amount of exercise enjoyed by the former, cause it to advance far ahead of the other in the attainment of strength. It would appear as if exercise—the habitual repetition of the acts for which it was intended by nature—were part of the necessary aliment of the muscular part of our frame; as essential to its full development as the flow of blood through our veins, the admission of air to the lungs, and the mastication, digestion, and assimilation of food are to the preservation of life. Campbell's beautiful line,

"The might that *slumbers* in a peasant's arm,"

would thus appear, exquisite as is the poetical image it presents, to be founded on a physical error. Might cannot continue to slumber in any arm. If it does so it dies. It may be noiseless, unobtrusive, putting itself forth in hidden directions where its movements escape notice, but it has not been asleep. Had it slept, it would not have been to be found when wanted, nor been able to step forth into vigorous action when the necessity for its appearance arose.

Into the *rationale* of this arrangement of Nature it is unnecessary to enter. No matter whether we are able or not to explain, why or how it is, that every exercise of our muscles in the mode intended by Nature adds to their strength, and that, by neglecting or avoiding to exercise them, we prevent them from acquiring the strength necessary for enabling them to maintain their due place in our system; it is enough for us to know that the fact is so—that it is a *law*, upon whose uniform operation we can repose with unerring certainty. It points out to us the means by which we can bring our bodily frame to the highest state of perfection of which its original constitution will admit; and it also indicates to us, by a very natural analogy, a means by which we may probably reach the utmost attainable perfection of our moral nature—strengthening what is good—weakening and deadening what is evil.

The influence of habit, or of the frequent repetition of such acts as are the object of any natural tendency, appetite, or desire, in increasing the intensity of the natural feeling which prompts to their performance, is matter of the commonest observation. It proves to us that we have, in one class of cases at least, reason for inferring the existence of an analogy between the body and the mind in regard to the increase of strength derived by any organ of either from the frequent exercise of its functions. For the desire, or appetite, though closely related to the body, and incapable, perhaps, of being

exercised otherwise than through its instrumentality, is in itself a purely mental affection; and, as it undeniably derives continued accessions of strength from the simple fact of being repeatedly put forth, we have it thus proved that one class of mental affections does derive strength from exercise; and we therefore do no violence to the most cautious principles of reasoning when we infer, as a matter of the highest probability, that it is a general law, that *all* our powers, moral and intellectual, as well as bodily, derive their strength from continued and well regulated exercise, and dwindle away, sicken, and die in the absence of that necessary aliment.

It is therefore no delusion, but a great practical truth, that we can cultivate ourselves, as a gardener cultivates a rich fruit, so as to make ourselves in the end something very different from, and infinitely superior to, the unpromising affair which we found ourselves at starting; that we can cause what is good in us to grow in magnitude and strength, until it becomes the predominating part of our being; and that we can reduce the evil to such a condition of feebleness and insignificance, that it shall, in the end, almost cease to give us any annoyance. And the mode of cultivation which we are to adopt, is just the continued and regular exercise of those feelings and principles of action which we wish to cause to predominate, and systematically retaining in a state of inactivity those which we wish to weaken and destroy.

It is a mistake, we suspect, often fallen into—at least we have ourselves been conscious of an unacknowledged feeling of the kind,—to feel as if it were hopeless, and therefore scarcely a duty, to attempt to enter upon the exercise of a virtue to which we are conscious of not possessing a strong natural tendency, or of possessing, perhaps, a tendency to its opposite vice. Under the influence of this mistake, the utmost that is done is to allow our virtuous aspirations to evaporate in mere longings after the possession of a better spirit, as aimless and unpractical as the wishes of a man of unattractive personal appearance that his limbs were better formed, and his features more regular and expressive. There is a sort of imagination, that virtuous actions are to be expected only from men so constituted as that to act virtuously costs them no effort; and thus, instead of manfully setting about being virtuous, we are too apt, even in our best moods, to satisfy ourselves with merely wishing that we were so. We invert the true order of things. We expect to find ourselves at the goal before we have entered upon the course. We exemplify the folly of the man immortalized by the Greek Joe Miller, Hierocles, who having been nearly drowned in an attempt to swim, resolved never again to touch water until he had become perfect in the art. It is, we may rely upon it, as true in morals, that a virtuous spirit is only to be attained by continued and sustained efforts to perform virtuous deeds, as it is, in physics, that the art of swimming can only be acquired by repeated attempts to swim.

There is a certain amount of honesty in abstaining from acts, the performance of which is generally accepted as evidence of an inclination, which we are conscious we do not possess, towards any particular virtue. We cannot help, amid all our disapprobation for his irregularity of conduct, feeling some sort of respect for the man who disdains to appear better than he really is. It is undeniably one point of goodness, not to be a hypocrite. But let us not make more of it than it is worth, nor fall into the mistake of accepting the reverse of wrong for right. Hypocrisy has been very happily, but not quite accurately, described to be an homage which vice renders to virtue. It is an acknowledgment of the superior excellence of the latter, and so far serves a useful purpose that it bears public testimony to a truth. The homage itself is a right thing, and the withholding of it a serious crime; but, to describe hypocrisy truly, we must add something more to the definition. Its essence consists in this, that it is an homage paid by vice to virtue to serve the purposes of vice; that it is a yielding

of outward reverence to the good, in order more securely to bestow the affections of the heart upon the evil. The bad man who refuses to put on the outward appearance of a regard for virtue which he does not feel, is one step further removed from utter reprobation, than he who endeavours, by a show of outward reverence for virtue, to secure a larger license for vicious indulgence; but only one step. He is more offensive, without being more respectable, than he who, though feeling no desire, and making no effort, after amelioration of character, shows so far a deference for what he knows to be right, as to cast a decent veil over his moral deformities. And he is not only offensive, but a fool, if he makes his boasted dislike of hypocrisy an excuse for holding back from that course of virtuous endeavour, which we believe to be the only means within our reach of acquiring, and rearing up to maturity, of strength, virtuous inclinations.

Let no man, therefore, who truly desires to become better than he is, suffer his consciousness of the present want of strong moral principle, or of a real inclination for what he knows to be right, to deter him from the endeavour to act as these feelings would prompt him to do if he possessed them. If he feels humiliated by the reflection that his conduct speaks a different language from his heart, and fears that, on that account, he may be chargeable with hypocrisy, let him console himself by reflecting, that, in adopting the outward demeanour, the habits, and practices of virtue, he is taking the most effectual means in his power for bringing round his heart to a right tone of moral feeling; and that, so long as the object of the appearance of virtue which he puts on, is that he may thereby gain the reality, he is free from that which constitutes the very essence of hypocrisy.

Let us take, for example, the case of a man who is naturally of an avaricious disposition—of slow and reluctant sympathies for the sufferings of others, and whose habitual inclination, when he sees any one in need of assistance, is to pass by on the other side. If such a man, impressed by some means with the persuasion that he would be a better man, happier, and more estimable, if his heart were more open to sympathy for the distresses of his neighbours, and his hand more ready to relieve them, continues to act on the impression that a change of his natural disposition must precede any available attempt on his part to change the course of his outward actions, he will never succeed in changing either. Mere wishes, not carried out into action, will be as little productive of permanent effect, as the slight breeze which ruffles the surface of the lake. The breeze falls, and the water returns to its former condition of calm placidity. The slight sickly seed of sympathy within him, will sicken yet more and more from the want of its proper nourishment, until at last it sinks beyond all possibility of recovery. But, on the other hand, let him begin by doing, no matter how grudgingly,—with what constraint upon his inclinations,—that which the feelings he desires to possess would prompt him to do in the circumstances if he had them—let him give, however unwillingly,—let him act the part of the good Samaritan, with however had a grace,—and let him but continue steadfastly so doing; the selfish hardness of his heart will by degrees give way under the repeated strokes of this wholesome discipline; the sympathies forcibly called into action will acquire the habit of coming spontaneously; the habits of his mind, the tendency of his feelings, will fall into a new track, over which they will travel with ease and vigour; that which was at first a painful constraint will grow to be a pleasurable impulse; by a moral chemistry, analogous to that by which we convert the food we eat into a part of our bodily frame, the mind, daily nourished upon virtuous habits, will assimilate them into virtuous principles; until, by this course of *self-cultivation*, the whole character of the man is changed: the crab is converted into an apple.

We might go over the whole catalogue of the virtues in like manner, and illustrate by each of them the prin-

ciple of self-cultivation which we have been endeavouring to enforce. We might show that there is no one quality which gives a man a pre-eminence over his fellows, which is not, to a greater or less degree, within the reach of whoever will take the trouble of placing himself under the requisite training for its attainment; that, making the proper allowance for constitutional differences, the existence of which it would be folly to deny, every quality of which a seed, however minute, exists in the mind, may be made to grow up into strength, or sink into inanition, according to the direction which we give to our active habits.

The advantage of this mode of looking at the question of self-training, is that it is pre-eminently practical, that it clears away from the subject the haze which invests it, as long as we speak of the mind, its faculties, or inclinations, as things to be moved or affected by the will. We feel assured that we speak to the experience of many of our readers,—that we recall to their minds the recollection of many a feeling of anxious bewilderment, connected with that portion of their lives when the mind most perplexes itself with high and abstruse questions—the period of emerging from early childhood, when we refer to the inevitable obscurity attending such precepts as direct us to *be* this or *be* that, but fail to indicate what we are to *do* in order to *be* what is required. How often, after listening with submissive reverence to the sage and serious counsels of an affectionate parent—admirable in every thing but the want of a distinct practical bearing—does the child depart, his heart glowing with a longing for the purity of heart, the heavenly serenity of temper, the resolute courage in the path of duty, which have been so feelingly urged upon him, but his mind hopelessly perplexed with the inquiry, to which he can find no satisfactory answer, “How am I to set about it? What thing am I to do that I may attain all this?” He feels that he cannot lay his hand upon the mind itself, and make it abide until he has moulded it according to the model set before him; and he does not know what else he can do. How great a relief would he not find from his perplexity in the simplicity, the directness, the almost mechanical practicability of the precept, which, bidding him give up as useless the attempt to produce a permanent effect upon the mind by a mere effort of volition, however sustained, or by any other means pointed directly at the mind itself, shows him how he can accomplish the object by entering upon a course of action involving no mystery as to means, and every step of which is placed under the direct and undivided control of the will.

If we are right in the view we have taken of this subject, it follows that no original faultiness of constitution can ever be a sufficient excuse for permanent degradation of character. Whatever may be the case with regard to occasional outbursts of natural temper or disposition, no man can go on saying with truth of any course of action to the end of the chapter, “I could not help it.” There is nothing which we cannot help, unless it be the height of our stature, or the hue of our skin. These we cannot alter “by taking thought;” but, in other respects, we are our own gardeners, having it in our power to make of ourselves very much what we please, to cause one branch to grow and another to wither away, as we find to be most conducive to the eventual perfection of our being.

NATURAL HISTORY OF BIRDS.

No. I.

INTRODUCTION.

THE contemplation of living nature has always riveted the attention of thoughtful men, and opened innumerable sources of the purest enjoyment to the

inquiring intellects of every age. The numberless forms of beauty and grandeur which crowd this universe, have such a deep significance, that all truth-seeking minds must stand and gaze reverently, till the great phenomena are understood.

When we consider that millions upon millions of living beings, each possessing an organization the mysteries of which baffle all the acuteness of our philosophy, present daily subjects for speculation, it is no matter of surprise to find multitudes drawn to the spectacle. The theme is not deep and recondite, for beauty is here united with simplicity, whilst a rich diversity of facts ensures a constant flow of interest.

The subjects of natural history are ever at hand; all parts of the earth, every ocean region, and the wide far-stretching aerial spaces, pour forth a stream of life for our contemplation. Thus the world is but one great cabinet of wonders, open to all who have acquired the ability to use it rightly. How pitiable to live in this vast museum of nature, ignorant of the beauties surrounding us, seeing no mystery, and therefore impressed by no reverence! Such resemble the rustic, who walked without interest through a gallery, rich in the great works of many ages, but was, in the next hour, thrown into ecstasies by the tumbles of a harlequin. The countryman did not understand the objects displayed, hence his mind kindled not. In like manner, indifference to the great facts of nature arises from our ignorance of those bright facts, and glorious revelations, which light up with a mysterious splendour the whole system of nature.

Let us, therefore, look into the universe of life: let us gaze upon the countless proofs of wisdom, and goodness, in the worlds of animated existence, assured that, from the minutest invisible animalculæ, through every order of being, we shall find matter to enlarge the intellect and improve the heart.

It is, therefore, our purpose to furnish a series of articles, comprehending the most important and interesting facts in natural history, so arranged that each department shall have its due share of attention, and all its parts presented in a certain number of consecutive papers. Each division of a subject will be discussed before proceeding to the next, and thus the reader will possess an unbroken and full view of the whole series.

We commence with the inhabitants of the air, a department of Natural History abounding in diversified and striking facts. From the age of Aristotle to the present period, Ornithology has won for itself the attention of the most distinguished zoologists, who have devoted their best years to the illustrations of its facts and principles. Some, carried away by their enthusiasm, have given up, for a time, the pleasures of civilization, penetrated into wild regions, and made their homes in almost inaccessible forests, for the better observation of the habits and instincts of the feathered tribes. Nor let any too hastily conclude such pursuits beneath the dignity of man. God is known by his works; and the glory of the Eternal may be as clearly manifested by the organization of a bird, as by the structure of a planet.

It is evident that birds must be classed according to their several natures, in order that a clear survey may be taken of their history. No extensive subject can be studied, without some arrangement of its facts; and the better the disposition, the greater will be the

facility given to the student in prosecuting his researches. We do not intend to describe minutely the various systems of classification advocated by different authors, as a sentence or two will suffice for stating the principles on which all classification is founded.

If two birds are seen at the same time, one feeding on land, the other in the water, no person, however ignorant of ornithology, would place them in the same order. We would call the one a land, the other a water bird. This is the primary division made by the celebrated English naturalists, Willoughby and Ray, whose system was published about the year 1676. They divide the whole feathered creation into land and water birds—an arrangement which is both simple and natural. Again, we may perceive a striking dissimilarity between two land birds; and this diversity requires further classification. One may be a bird of prey, the other a feeder on grain. All of the first kind, we should class by themselves, and call the whole order *raptores*, from the Latin word *raptor*, which denotes a plunderer. The feeders on grain we should designate by the term *Granivori*, signifying grain eaters. These divisions we call orders.

But we might discover some remarkable differences between the birds in one of these orders; as, for instance, the eagle and the owl are both placed in the order *raptores*; but they are widely separated by some obvious peculiarities.

Hence arises the necessity for a further division. The eagles would be classed by themselves, under the name *falconide*, which includes all birds of the falcon kind. The owls we should arrange in a group, by the term *strigide*, a word derived from *strix*, the Latin for an owl. These subdivisions are called families; and, in a regular system, would thus be placed.

ORDER *Raptores*.

First family, *falconide*.

Second family, *strigide*.

These remarks may serve to illustrate the principles of scientific classification; and the following outline of what is called the *Linnean* system, may more clearly exemplify the usual methods of classification.

First order, *raptores*, or birds of prey; which includes vultures, eagles, owls, and butcher-birds.

Second order, *pica*, or *pica*. This includes numerous birds, such as the crow, bird of paradise, cuckoo, and parrot.

Third order, *passeres*; a large order, including the pigeon, thrush, finches, robins, &c.

Fourth order, *galline*; comprehending all the poultry kind: such as the pheasant, peacock, and turkey.

Fifth order, *grallae*. These are wading birds, as the heron, bittern, woodcock, and snipe.

Sixth order, *anseræ*, including all of the geese and duck kind.

This arrangement is not given as the most perfect, but as sufficiently explicit for the general reader. The naturalist is well aware of the imperfections clinging to most systems of classification; but it would be useless to weary the reader with comparisons between the classifications of Linnaeus, Pennant, Cuvier, and Temminck. Nor would the most enthusiastic ornithologist be much edified by an analyzation of the Quinary system, with its orders, tribes, and families of *fives*.

We shall now proceed to notice some facts connected with the organization and habits of birds, which may prepare the reader to enter with advantage into the details of the ensuing articles.

Flight of Birds.—The first phenomenon which attracts the attention of those who observe the peculiarities of birds, is that of flight. The easy and beautifully undulatory motion of an animal body through the air, compels the attention of the most sluggish.

How do birds fly? is a question which a child may

ask, but to which many men are unable to reply. Most have a notion that the bird is somehow raised by the wings striking against the air, but here the ideas stop.

The act of flying is the result of a series of complicated and beautiful agencies, illustrating the character of that infinite wisdom, which is equally adorable, whether manifested in the workings of the solar system, or developed in the muscular action of a winged animal.

Let us notice a bird in the act of rising from the ground. The animal does not rely first upon its wings, but uses the legs to assist it in making a spring upwards, by which it clears the ground, and secures air-room for the action of the wings.

Any one who observes the rising of a bird, must notice the crouch by which it prepares for the spring; and which may be compared to the plunge made by a diver into the water. So essential is the action of the legs in this spring, that birds with very short legs, as the swift, rarely alight upon the ground, as if conscious of the difficulty of rising.

When the bird has clearly risen from the ground, the agency of the wings is at once applied. As the arms of a swimmer, sweeping through the water, give the body an impulse, so the wings of a bird, striking another fluid, sends the animal forwards or upwards, according to the direction of the impulse. When the wings are raised to make the impelling stroke, they are kept as closely folded as possible, in order to diminish the resistance of the air; but, in making the stroke, each wing is fully expanded, to render that resistance as great as possible. Thus the rower feathers his oar, or turns the edge to the wind when bringing it forwards, but presents the whole breadth of the blade to the water in making the stroke. By such a series of rapid strokes the flight is performed.

But a further provision for facilitating this aerial locomotion must be noticed. The larger bones of a bird are hollow, and without marrow; these cavities are filled with air from the lungs when the bird flies, and thus the body becomes much lighter than is possible in the case of an animal whose bones are solid or filled with marrow. Besides the air cells just named, there are numerous cavities interspersed through the body, into which air is injected.

The air is rarefied by the heat of the bird's body, and must therefore act upon it as gas upon a balloon, tending to raise the whole trunk upwards.

This inflation of the body must evidently be an important auxiliary in promoting the flight of birds, especially of those which soar to great heights. We need hardly remind the reader that all the feathers of a full grown bird are hollow, as the inspection of a quill will show; these are also filled with air in flying; so that every part of a bird during flight is filled with gas like a balloon. In addition to all these means, birds are furnished with muscles of great strength; those which move a swallow's wing being at least seventy times stronger in proportion to the other muscles, than those which move the human arm. From all these combinations directed to one end, arise those varied, graceful, and easy motions, exhibited in the long sweep of the eagle, and the circling flight of the pigeon.

Hence we cannot wonder at the failure of all attempts to enable man to fly; for no machinery can provide the human body with air cells, by which its specific gravity might be diminished; nor can an arm acquire muscular power to move artificial wings, with the force which a bird exerts in each of its numerous strokes.

Hence we must ever yield to birds the realms of air, in spite of all our balloons and highly-wrought mechanical devices.

The Feet of Birds.—These, though of less importance to most birds than the wings, require a few observations. The feet and legs of birds are as beautifully adapted to their several modes of life as the wings. This, indeed, we should expect, for all the productions of an infinite designer must be equally perfect. The differences between the feet of birds have a great influence in fixing

their place in ornithological arrangements, for it is obvious that the duck's paddle-shaped feet fit it for the water; whilst those of the swallow, or sparrow, are formed for perching and clinging to branches, twigs, or other projections.

Those birds which seek their food in marshes, and shallow waters, as the heron, require long legs to assist them in wading; and with these they are provided; whereas, such limbs would be an incumbrance to the hawk, which requires a powerful grasping apparatus.

Most persons, doubtless, have observed a bird sleeping on its perch: and some may have wondered how a sleeping bird maintains its position on one leg during the most tempestuous night, when the branches of the gnarled oak are tossed to and fro by the storm; yet there the little slumberer rests safely, whilst our strongest houses tremble to their foundation. The mechanism of the bird's leg secures this result without effort. The moment a bird perches upon a branch the weight of its body causes the leg to bend at the joint; this bending tightens a set of muscles which descend to the toes; this stretching of the muscles forces the claws to contract round the substance on which the bird stands. Thus the claws are kept tightly grasped round the twig till the bird chooses to move. Such is the simple and beautiful mechanism by which the smallest of the feathered race maintains its hold by one leg during the longest night; and a bird is most completely at rest when standing, for this stretching of the muscle does not require the slightest labour on the part of a bird. The shape of a bird's body requires a peculiar organization of the feet. The body projects forward, very much, hence the toes must be long, to give a strong base of support, and prevent the bird from falling forward. All birds have feet and legs, though sometimes they are very short; hence the term *apodæ* (footless), given to some, and especially to the birds of paradise, is erroneously applied.

The sight of birds—is another point deserving consideration. The vast height to which some birds soar, and their detection of small objects from such immense altitudes, prove the possession of strong seeing organs. It has been proved by repeated experiments, that birds can see minute objects at distances beyond the power of the human eye, and it is supposed that the carrier pigeon is guided in its voyages by the eye alone. Soaring circle above circle, it gains at last a view of its well-known home, and flies direct to its destination.

The kite frequently rises to a height beyond our view, but mice, and the smallest animals, can be discerned with ease from its loftiest ranges.

By what peculiar organization of the eye do birds possess this astonishing power of sight? *The optic nerve*—is very much expanded, and thus numerous sensations are received by a bird to which our organs are insensible. The eyes of birds are also much larger in proportion to their size than those of other animals; hence some birds are completely overpowered by the full glare of the sun, and come abroad in the evening, when their exquisitely constructed organs are able to extract abundant light from the dimness of twilight.

The circle of vision must be very great in birds, for an eye being placed on either side of the head, they must take in nearly two semicircles of the whole horizon. A man sees the same object with both eyes, but a bird may see at the same time, a tree on one side, and a man on the other; and each perception be distinct and accurate. The eyes of birds are defended from injuries in their rapid flights, and from the intense glare of the sun, by a kind of curtain, which can be drawn at will over the eye. It is transparent, and thus the organ of vision is protected, and sight not obstructed. The eyelids form an additional defensive curtain, for these, being large, especially the lower one, are of themselves a secure protective case.

Hearing of birds.—When we observe the human ear, we see an extended conformation fitted to collect sounds.

No such structure is perceived in the generality of birds; hence some have imagined that their power of hearing must be feeble. This however is not the fact. Birds have no external ear, because such an appendage to the head would have interfered with their movements through the air, but they possess an auditory conformation perfectly adapted to their natures. The aptness for imitating sounds and musical compositions, proves great quickness of ear. Birds have been known to listen with every symptom of delight to pieces of music, and to manifest anger when their favourite melodies have been exchanged for others. Thus a pigeon listened to the performance of Madame Piozzi on the harpsichord, and detected any variation from correctness, which the lady often made to test its delicacy of ear.

The nightingale distinguishes a rival in song, when the distance requires the nicest attention and quickest ear in man to detect the remote melody. Thus the absence of an external ear must be compensated by great delicacy of structure in the internal organ.

Voice of Birds.—The variety, strength, and beauty of the sounds uttered by these inhabitants of the air, delight all persons. As our observations must be brief, the reader must not expect a treatise on the song of birds. Such notices will be given, as opportunity offers, in the subsequent papers.

The lungs and windpipe of birds may be compared to an organ or bagpipe; the lungs supply the wind, and the windpipe represents the pipes. The sounds produced by some have a startling resemblance to those proceeding from a hautboy, or clarinet; and the various windings of the windpipe may be likened to the turns of a French horn, or the divisions of a bassoon.

Muscles of great power have been demonstrated by anatomists to exist in the vocal organs of birds noted for their power of voice; and the cries of many birds, as storks and geese, reach us when they are more than a league above the earth. When the rarity of the higher parts of the air, and the downward passage of the sound, are considered, we must regard the vocal organs of these birds as possessing five or six times the strength of the human voice.

There are evidently certain notes which birds of all species understand, especially the alarm cry, sounded on the approach of danger. Thus, let a hawk be described by a swallow, the latter raises a peculiar cry: from every spot a host of other birds, swallows, sparrows, robins, finches, &c., rush to the place, as if to meet in battle array their foe.

Birds which move in troops by night, as geese, cranes, and the like, have a note which enables them to avoid straggling in the dark. There is, also, a peculiar cry uttered by many birds, upon the discovery of a large feeding ground, which never fails to bring troops of their species to the place. Hence, for strife, or peace, there are fixed sounds, understood by all birds of the same race, and, in some cases, by all birds whatever.

The variations in the notes of birds are numerous, and result from differences in the windpipe, just as large organ pipes produce a deeper tone than those of a smaller diameter. Some connexion appears to exist between the nature of the bill and the character of the song; for all soft-billed birds have mellow and plaintive voices, whilst those of the hard-billed kind are lively and harsher. The former also sing more from the lower part of the throat than the latter, and thus acquire that rich mellowness of note, possessed in its highest perfection by the nightingale.

Birds of the same species do not keep to one note; and White illustrates this fact in his account of some owls. He says, "A friend remarks that most owls hoot in B flat; but that one went almost half a note below A." "A neighbour of mine remarks that the owls about the village, hoot in their different keys, in G flat, or F sharp, in B flat, and A flat. The note of the cuckoo varies in different individuals; for about Selbourne wood they were mostly in D. He heard two

sing together, the one in D, the other in D sharp, which made a disagreeable concert; he afterwards heard one in D sharp, and some in C."

Here this introductory article must be brought to a close. In the next part, we shall describe the habits, uses, and peculiarities of birds of prey, illustrating those topics by appropriate facts and observations.

THE HOLY CITY.

[Second Notice.]

"Even the lifeless stone is dear
For thoughts of Him."

HOLY Scripture, and all the ancient writers, agree that the site of Calvary was formerly without the city; but it has been brought within its bounds by a later disposition of the walls. The credit of the whole church, Mr. Williams says, for fifteen hundred years, is in some measure involved in the tradition relating to the Holy Sepulchre; and we are bound to weigh with jealousy the evidence adduced by Dr. Robinson and Dr. Clarke, which would convict of fraud and hypocrisy the brightest lights of the universal Church, at a period which we are taught to regard as "uncorrupt," when Christianity was "most pure, and, indeed, golden." "Either they were impostors," says Mr. Williams, "or they had sufficient evidence to believe that they had really recovered the Sepulchre of our Lord. And it is remarkable that the strongest objection that has been urged against the authority of the tradition, is such as it would have been most easy to obviate—such as an impostor would have been certain to foresee, and most careful to anticipate."

We have not space to follow Mr. Williams in his long controversy with Dr. Robinson, respecting the Holy Sepulchre, but shall now proceed to abridge his account of that holy place, and the localities around it. The Sepulchre itself consists of two chambers, whereof the outer one is said to have been built by St. Helena, while the inner one is represented as the very cave, hewn out of the rock, where was the tomb of our Lord. The very spot where the holy body is said to have lain, is now covered with marble to protect it from injury. "The tomb was designed by Joseph for his own burial, so that it had but one receptacle; and, as it had known no occupant before, so we may be well assured that it would know none after it had been so honoured, but would be preserved inviolate by its believing owner, who would provide himself another resting-place, probably in the same sacred garden." The Sepulchre stands in the centre of a circular building, covered with a handsome dome left open at the top, in order that the tomb may be exposed to the canopy of heaven. Opposite to the entrance of the cave is the door of the Greek church, supposed to occupy the site of the Basilica erected by Constantine. This is the finest church in Jerusalem, excepting only the magnificent church of St. James, attached to the Armenian convent on Mount Zion. It is of large dimensions, and surmounted by a cupola of considerable size. A cloister runs completely round the church without, forming the means of communication between the sacred localities, common to all the Christians.

The church of the Franciscans is a meaner building, to the north of the Sepulchre, and is called the Church

of the Apparition. Mr. Williams thus describes the other parts of the sacred building: "The Armenians worship in one of the galleries of the Rotunda; the Syrians have a small chapel in the thickness of the wall to the west of the Sepulchre; while the Copts have their altar in a small erection, scarcely large enough to admit the officiating priest; at the west of the cave itself. There are also apartments in the neighbourhood of the respective chapels, assigned to the monks of these several churches, who wait continually on their ministry at the sacred places, and live immured, as it were, within the walls; while other chapels, commemorative of events connected with our Saviour's Passion, in various parts of the building, occupy the remainder of the sacred enclosure, which is of considerable extent.

"The entrance is from a paved court on the south side, through the westernmost of two handsome doorways, with an architrave in bas-relief, representing our Lord's triumphant entry into Jerusalem. The first object that attracts attention within the building is the stone of unction in the vestibule. . . . Proceeding a few paces down this [south] cloister, [the pilgrim] finds on the right a flight of eighteen steps leading up to the chapel of the Holy Golgotha; and if he be an oriental he will put off his shoes from his feet, and approach with reverential awe the scene of his Lord's last Passion, and draw near on bended knees to the very spot of the Crucifixion. If he be an Englishman or American, the attendant priest will not look for such a deportment; he will expect nothing more than a look of indifference, or at most of idle curiosity, and will be prepared for sceptical objections; he will even look for an expression of incredulity, and an apparent pre-determination to disbelieve. It is sad to think that a person in Frank habit, kneeling at Calvary and the Sepulchre of Christ, and offering up his devotions at these sacred spots, venerated by Christians of all nations for fifteen hundred years, should be as it were a monster to those who witness it; but such is the fact. . . . At the east end of the north side of the double chapel he will see a platform raised about a foot and a half from the floor, covered with white marble; and, under the altar of the orthodox he will observe a hole in the marble, communicating with a deep bore in the solid rock, in which he will be told that our Saviour's cross was erected. Near this, on his right, he will see another incision in the marble, showing a fissure in the rock, said to have been occasioned by the earthquake which occurred at the time of the Crucifixion.¹ If he examine it minutely he will perceive that 'the insides do testify that art had no hand therein, each side to other being answerably rugged, and these where inaccessible to the workmen.' The continuation of this cleft may be seen in the chapel of the Forerunner, below Golgotha. . . ."

We are then conducted to the cave where St. Helena is supposed to have discovered the cross of our Lord:—

"Descending from Golgotha, and passing down the cloister towards the east, we come to a wide staircase, leading down twenty-nine steps to a chapel of the Armenians, where they show the throne of St. Helena; and then, by thirteen more, into the cave where the cross of our Lord is said to have been discovered. There the rock overhangs the chapel, which is formed in its cavity.

"The Invention of the Holy Cross, which is commemorated in the English calendar on May 3, would seem to be historically connected with St. Helena's visit, and the recovery of the Holy Sepulchre; and a writer, who is least disposed to admit the reality of the discovery, is forced to acknowledge, that 'notwithstanding the silence of Eusebius, there would seem to be hardly any part of history better accredited than the alleged discovery of the true cross.'"

(1) "It is said to have been rent at the feet of the centurion, and to have produced the exclamation, St. Matt. xxvii. 54."

"St. Ambrose is the first extant writer who gives a detailed account of the undertaking, and ascribes it to St. Helena. In his discourse upon the death of Theodosius, he takes occasion to eulogize the mother of Constantine, and relates the success of her endeavour to possess herself of the Holy Cross. This narrative, divested of the flowers of oratory, is simple enough, and contains no account of any miracle, unless the very preservation of the wood deserves to be so considered. This father, in argument with St. Chrysostom, relates the discovery of three crosses, and that the Cross of our Lord was distinguished by the title affixed to it by Pilate; not by the restoration of a sick person to health, or of a dead corpse to life, as we find in later writers.

"St. Helena would appear to have been guided in this case, as in the case of the Holy Sepulchre, by the received and continuous tradition of the native Christian church, which reported that the instrument of our Lord's crucifixion had been cast aside, in the hurry of the preparation of the Passover, into a pit near the place of execution, which she caused to be examined, and three crosses were actually discovered; and, however strange or startling the fact may appear, it is better to suspend the judgment, if we are not satisfied with the evidence, than to impute so great a crime as imposture and fraud to men who, for ought we know to the contrary, may have been eminent saints."

Mr. Williams passes from the Church of the Holy Sepulchre to the opposite hill of Moriah; and he appears to have subjected it to a very minute inspection. The Mosque of Omar occupies part of its site. It is octagonal in form; its dome is covered with lead, surmounted by a tall gilt crescent. Beneath the dome is a remarkable limestone rock, which appears to be the natural surface of the rock of Mount Moriah. Here, also, are the Mosque of el-Aksa, with two or three others, and the remains of the tower of Antonia. Mr. Williams thinks there can be but one opinion that the Mosque el-Aksa is the church erected by the Emperor Justinian, which he dedicated to the Blessed Virgin, and was described as placed on the loftiest hill of the city. "I firmly believe," says Mr. Williams, "that es-Shakrah (the rock) does mark the site of the Most Holy Place, as Christians, Jews, and Mahomedans all agree."

Eusebius, commenting on the predictions of our Lord respecting the entire destruction of the Temple, so that "there shall not be left here one stone upon another, that shall not be thrown down," says, "Just as the prediction was, are the results in fact remaining; the whole Temple and its walls, as well as those ornamented and beautiful buildings which were within it, and which exceeded all description, having suffered desolation from that time to this!"

After making a longer quotation from Eusebius, Mr. Williams adds:—

"Thus far Eusebius. For myself I look for the accomplishment of the prophecy in its widest and most literal sense; and expect that if there be still one stone left upon another, which at least is not certain, the mighty, though silent, operation of that wonder-working Word will in due time bring it down; and who can tell whether, before the time of the end, some second Julian may not renew the attempt to rebuild the Jewish temple, which antichrist alone shall rear, and whether this attempt may not result in the destruction of such portions of it as remain?"

Mr. Williams now proceeds to describe the antiquities without the city.

"We quit the city by the gate of 'our Lady Mary' (Bab Sitti Miriam), as the natives term it, more commonly known to the Franks as the St. Stephen's Gate. . . . Descending now into the Valley of Jehoshaphat by a zig-zag path of steps down the deep declivity, the dry bed of the torrent Kedron is passed by a bridge of one arch, a few paces beyond which is the chapel of St. Mary, on the left, and the garden of Gethsemane on

the right, between which the most direct path ascends to the church of the Ascension, which crowns the centre of the three summits of the Mount Olivet, 2,400 feet above the level of the Mediterranean Sea."

After replying to a late severe attack on the tradition which marks this as the scene of the last act of our Saviour's ministry, Mr. Williams says:—

"A very few words may suffice for the description of this ruin, for at present it is nothing more. Instead of a church there is now a mosque near this site, the keeper of which holds the keys of a small portal giving entrance into a paved court of some extent, open to the sky, around which are ranged the altars of the various Christian churches, while the centre is occupied by a small circular building, surmounted by a cupola. . . . Descending now to the Valley of Jehoshaphat, by a more circuitous path, we pass the Cave of the Creed, a curious vaulted chamber in ruins, beneath the surface of the ground, apparently sunk in the rock, and plastered; oblong in form, with six niches on each side facing one another, where the apostles are said to have assembled to compose the Creed. Further down the mountain side is pointed out the spot where our Lord wept over the city, and foretold its destruction."

The Fountain of Siloam is thus described:—

"The descent to the spring is one of the most picturesque *pieces* about Jerusalem. It is effected by a flight of steps, much worn by the natives, cut through the rock, which is wildly irregular. There are twenty-six steps, making the depth about twenty-five feet, for the steps are deep. There is a cave in the rock, of no great dimensions, roughly hewn, into which the water flows from beneath the lowest step. . . . From the chamber there is a channel cut in a serpentine course, 1,750 feet long, to convey the water to the Pool of Siloam, which will next demand attention. To reach it we ascend again to the bed of the Kedron, and pass round the point of Ophel, a distance of 1,355 feet. . . . Turning to the right, round a sharp angle of rock, we enter the mouth of the valley of the Tyropean, and passing under the precipitous rock, which has a small channel for the water cut in its base, we soon arrive at the Pool of Siloam.

" . . . The pool itself is a small tank just without the fissure, of an oblong form, remarkable for nothing but some fragments of marble columns projecting from its sides, probably the remains of a church; the water is confined in this or in the rocky basin, and drawn off, as occasion requires, to irrigate the gardens beneath.

"There is every appearance of there having existed formerly a much larger reservoir than the present, immediately to the east of it, confined at the lower end by a substantial wall of masonry, which now forms a dry bridge, at the south end of which is the ancient tree said to mark the spot of Isaiah's martyrdom."

Of the Pool of Bethesda, Mr. Williams says:—

"It has been remarked by critics, that St. John, by his use of the present tense in speaking of Bethesda, intimates that it had survived the destruction of Jerusalem, and was still well known when he wrote his Gospel, at the close of the first century, which would form a strong presumption for its continued preservation until the time of Constantine. The pool is placed by this evangelist in the 'sheep-market,' but many commentators are of opinion that the word *gate* should be supplied in this passage instead of *market*. . . . It would appear that the tradition which marks the Birket Israil as the 'Pool of Bethesda,' has much to be said in its favour, and I am not aware of any arguments against it. The five porches have long since disappeared."

We must make one other extract from this chapter, and then pass on to Mr. Williams' account of Modern Jerusalem.

"From a very early period [Christians] have been taught, rightly or wrongly, to regard a chamber in the pile of buildings surrounding the tomb [of David], as

the upper room consecrated by the institution of the perfecting Sacrament of our Redemption, where also our Lord appeared to the assembled apostles after his resurrection, and where the Holy Ghost descended visibly on the believers on the day of Pentecost. It is related by Epiphanius, that this building, and a few others in its vicinity, escaped destruction on the desolation by Titus, and that this chamber was the church of the faithful after their return from Pella."

From the account of the present state of the Holy City and its inhabitants, we have merely room for the following extracts.

"The Christian pilgrim who approaches Jerusalem for the first time, will probably be disappointed to find that his emotions on the first sight of a city, associated in his mind from his earliest infancy with all that is most sacred, are so much less intense than he anticipated, and that he can look on Mount Olivet and Mount Zion with feelings, certainly not of indifference, but of much less painful interest than he imagined possible, when he thought on them at a distance. The truth is, the events transacted here are so great in every view, that the mind cannot at once grasp them; but is, as it were, stupified by the effort. It takes time to realize the truth that this is the home of Scripture History, the cradle of the Christian Church.

"If he is journeying from the west, as most pilgrims do, he will come in sight of the city about a mile from its gates, and will have the least interesting view which it presents—merely a dull line of wall, with the Mount of Olives rising above. He will, perhaps, have read of the desolate appearance of the neighbourhood of the city; it is sometimes said to resemble a city of the dead. Travellers, who have so written, must have been singularly unfortunate in the time of their entrance; for on a bright evening, at any time of the year, nothing can well be imagined more lively than the scene without the Jaffa Gate. It is then that the inhabitants, of whatever nation, and whatever faith, walk out to 'drink the air,' as they express it, and the various companies may be seen sauntering about, or reclining on the ground. Let him enter the gates, and the delusion which its compact and well-built walls, and the appearance of its inhabitants, may have produced, will be quickly dispelled. He no sooner enters the city than desolation stares him in the face.

"Let us suppose him present in Jerusalem during the holy week; he will feel a curiosity to witness the ceremonies in the Church of the Holy Sepulchre—let him go, by all means, at least if he can go to mourn, not to mock or to triumph over the scenes which will there be enacted. If he arrives at the great gates of the Church about sunset, he will find them closed for a few minutes, while the Moslem guardian and his attendants perform their devotions. A small window in the door will allow him to watch their ceremony, and he may learn a lesson of outward propriety and decorum from the infidels, which he will look for in vain among the worshippers within. On his admission, the first object which will excite his astonishment and horror, will be the Turkish soldiers of the garrison standing with their bayonets fixed, in various parts of the sacred precincts, and about the Holy Cave itself. If he inquire the reason of this dreadful profanation, he will be informed that the Latins have requested it as a protection against molestation from the Greeks!

"But among all the exhibitions of the Christians in the Holy City, that which must most scandalize the infidels is their shameful divisions, accompanied with jealousies and heart-burnings, and not unfrequently attended with sanguinary quarrels and acts of violence, which call for the interference of the civil powers."

The principal Christian bodies in the Holy City are the Greeks and the Latins; the others are the Georgians, the Armenians, the Syrians, the Copts, and American Congregationalists. The Anglican Church, until the arrival of Bishop Alexander, in 1842, cannot pro-

perly be said to have been represented in Jerusalem. He was its representative in Chaldea, Mesopotamia, Syria, Palestine, Egypt, and Abyssinia.

We must now take our leave of Jerusalem, and of Mr. Williams' very attractive and instructive volume. Many more passages might have been transferred to our pages, but for want of room. Those, however, that we have given will furnish a foretaste of the gratification which a perusal of Mr. Williams' book will not fail to afford. It is profusely illustrated by maps and plans, and by very clever lithographs and wood-cuts.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. III.

We had not more than five minutes left when we arrived at Dr. Mildman's door, Coleman affording a practical illustration of the truth of the aphorism, that "it is the pace that kills;" so that Thomas's injunction, "Look sharp, gentlemen," was scarcely necessary to induce us to rush up stairs two steps at a time. In the same hurry I entered my bed-room, without observing that the door was standing ajar rather suspiciously, for which piece of inattention I was rewarded by a deluge of water, which wetted me from head to foot, and a violent blow on the shoulder, which stretched me on the ground in the midst of a puddle. That I may not keep the reader in suspense, I will at once inform him, that I was indebted for this agreeable surprise to the kindness and skill of Lawless, who, having returned from his pigeon-match half-an-hour sooner than was necessary, had devoted it to the construction of what he called a "booby trap," which ingenious piece of mechanism was arranged in the following manner. The victim's room-door was placed ajar, and upon the top thereof a Greek Lexicon, or any other equally ponderous volume was carefully balanced, and upon this was set in its turn a jug of water. If all these were properly adjusted, the catastrophe above described was certain to ensue when the door was opened. "Fairly caught, by Jove," cried Lawless, who had been on the watch. "By Jupiter Pluvius, you should have said," joined in Coleman, helping me up again; for so sudden and unexpected had been the shock, that I had remained for a minute or two just as I had fallen, with a kind of vague expectation that the roof of the house would come down upon me. "I suppose I have to thank you for that," said I, turning to Lawless. "Pray don't mention it, Pinafore," answered he; "what little trouble I had in making the arrangement, I can assure you, was quite repaid by its success." "I'll certainly put on the gloves to-morrow," whispered I to Coleman—to which he replied by a sympathetic wink, adding, "and now I think you had better get ready, more particularly as you will have to find out 'how to dress *jugged hair*,' as the cookery-books say." By dint of almost superhuman exertions, I did just contrive to get down in time for dinner, though my unfortunate "*jugged hair*," which was any thing but dry, must have presented rather a singular appearance. In the course of dinner, Dr. Mildman told us that we should have the whole of the next day to ourselves, as he was obliged to go to Town on business, and should not return till the middle of the following one;—an announcement which seemed to afford great satisfaction to his hearers, despite an attempt made by Cumberland to keep up appearances by putting on a look of mournful resignation, which, being imitated by Coleman, who, as might be expected, rather overdid the thing, failed most signally. On returning to the Pupils' room, Lawless commenced (to my great delight, as I thereby enjoyed a complete immunity from his somewhat troublesome attentions) a full, true, and particular account of the

pigeon-match, in which his friend Clayton had, with unrivalled skill, slain a sufficient number of victims to furnish forth pies for the supply of the whole mess during the ensuing fortnight. At length, however, all was said that could be said, even upon this interesting subject, and the narrator casting his eyes around in search of wherewithal to amuse himself, chanced to espy my new writing-desk, a parting gift from my dear little sister Fanny, who, with the self-denial of true affection, had saved up her pocket-money during many previous months, in order to provide funds for this munificent present. "Pinafore, is that desk yours?" demanded Lawless. Not much admiring the *sobriquet* by which Lawless chose to address me, I did not feel myself called upon to reply. "Are you deaf, Stupid? don't you hear me speaking to you?—where did you get that writing-desk?" Still I did not answer. "Sulky, eh? I shall have to lick him before long, I see. Here you, what's your name? Fairleigh, did your grandmother give you that writing-desk?" "No," replied I, "my sister Fanny gave it to me the day before I left home." "Oh, you have got a sister Fanny, have you? how old is she, and what is she like?" "She is just thirteen, and she has got the dearest little face in the world," answered I, earnestly, as the recollection of her bright blue eyes and sunny smile came across me. "How interesting!" sighed Coleman; "it quite makes my heart beat; you could not send for her, could you?" "And she gave you that desk, did she?—how very kind of her," resumed Lawless, putting the poker in the fire. "Yes, was it not?" said I, eagerly. "I would not have any harm happen to it for more than I can tell." "So I suppose," replied Lawless, still devoting himself to the poker, which was rapidly becoming red-hot. "Have you ever," continued he, "seen this new way they have of ornamenting things? encaustic work, I think they call it:—it's done by the application of heat, you know." "I never even heard of it," said I. "Ah! I thought not," rejoined Lawless. "Well, as I happen to understand the process, I'll condescend to enlighten your ignorance. Mullins, give me that desk." "Don't touch it," cried I, bounding forward to the rescue; "I won't have any thing done to it." My design was however frustrated by Cumberland and Lawless, who, both throwing themselves upon me at the same moment, succeeded, despite my struggles, in forcing me into a chair, where they held me, while Mullins, by their direction, with the aid of sundry neckcloths, braces, &c., tied me hand and foot, Coleman, who attempted to interfere in my behalf, receiving a push which sent him reeling across the room, and a hint that if he did not mind his own business he would be served in the same manner.

Having thus effectually placed me *hors de combat*, Lawless took possession of my poor writing-desk, and commenced tracing on the top thereof, with the red-hot poker, what he was pleased to term a "design from the antique," which consisted of a spirited outline of that riddle-loving female the Sphinx, as she appeared when dressed in top-boots and a wide-awake, and employed in smoking a cigar! He was giving the finishing touch to a large pair of moustaches, with which he had embellished her countenance, and which he declared was the only thing wanted to complete the likeness to an old aunt of Dr. Mildman's, whom they usually designated by the endearing appellation of "Growler," when the door opened, and Thomas announced that "Smithson" was waiting to see Mr. Lawless. "Oh, yes, to be sure, let him come in; no, wait a minute. Here, you, Coleman and Mullins, untie Fairleigh; be quick:—confound that desk, how it smells of burning, and I have made my hands all black too. Well Smithson, have you brought the things?" The person to whom this query was addressed, was a young man, attired in the extreme of the fashion, who lounged into the room, with a "quite at home" kind of air, and nodding familiarly all around, arranged his curls with a ring-adorned hand, as he replied in a drawling tone, "Ya'as, Mr. Lawless, we're

all right,—punctual to a moment—always ready 'to come to time,' as we say in the ring." "Who is he?" whispered I to Coleman. "Who is he?" replied Coleman; "why, the best fellow in the world, to be sure. Not know Smithson, the prince of tailors, the tailor *par excellence*? I suppose you never heard of the Duke of Wellington, have you?" I replied humbly, that I believed I had heard the name of that illustrious individual mentioned in connexion with Waterloo and the Peninsula,—and that I was accustomed to regard him as the first man of the age. "Aye, well then, Smithson is the second; though I really don't know whether he is not quite as great in his way as Wellington, upon my honour. The last pair of trowsers he made for Lawless were something sublime, a great deal too good for this wicked world." During this brief conversation, Smithson had been engaged in extricating a somewhat voluminous garment from the interior of a blue bag, which a boy, who accompanied him, had just placed inside the study door. "There, this is the new invention I told you about; a man named Macintosh hit upon it. Now, with this coat on, you might stand under a water-fall without getting even damp. Try it on, Mr. Lawless;—just the thing, eh, Gents?" Our curiosity being roused by this panegyric, we gathered round Lawless to examine the garment which had called it forth. Such of my readers as recollect the first introduction of Macintoshes, will doubtless remember that the earlier specimens of the race differed very materially in form from those which are in use at the present day. The one we were now inspecting was of a whity-brown colour, and, though it had sleeves like a coat, hung in straight folds from the waist to the ankles, somewhat after the fashion of a carter's frock, having huge pockets at the side, and fastening round the neck with a hook and eye. "How does it do?" asked Lawless, screwing himself round in an insane effort to look at the small of his own back, a thing a man is certain to attempt to do when employed in trying on a coat. "It does not make a fellow look like a Guy, does it?" "No, I rather admire the sort of thing," said Cumberland. "A jolly dodge for a shower of rain, and no mistake," put in Coleman. "It's deucedly fashionable, really," said Smithson—"this one of yours, and one we made for Augustus Flare-away, Lord Fitz-scampers's son, the man in the guards, you know, are the only two out yet." "I have just got it at the right time then," said Lawless; "I knew old Sam was going to Town, so I settled to drive Clayton over to Woodend, in the tandem, to-morrow. The harriers meet there at eleven, and this will be the very thing to hide the leathers, and tops, and the bit of pink under. I saw you at the match, by the bye, Smithy, this morning." "Ya'as, I was there; did you see the thing I was on?" "A bright bay, with a star on the forehead! a spicy looking nag enough; whose is it?" "Why, young Robarts, who came into a lot of tin the other day, has just bought it; Snaffles charged him ninety guineas for it." "And what is it worth?" asked Lawless. "Oh! he would not do a dirty thing by any gent I introduced," replied Smithson. "I took young Robarts there: he merely made his fair profit out of it; he gave 40% for it himself to the man who bred it, only the week before, to my certain knowledge: it's a very sweet thing, and would carry him well, but he's afraid to ride it; that's how I was on it to-day. I'm getting it steady for him." "A thing it will take you some time to accomplish, eh? A mount like that is not to be had for nothing, every day, is it?" "Ya'as, you're about right there, Mr. Lawless; you're down to every move, I see, as usual. Any orders to-day, Gents? your two vests will be home to-morrow, Mr. Coleman." "Here, Smithson, wait a moment," said Cumberland, drawing him on one side; "I was deucedly unlucky with the balls this morning," continued he in a lower tone, "can you let me have 25%?" "What you please, Sir," replied Smithson, bowing. "On the old terms, I suppose," observed Cumberland. "All right," answered Smithson. "Stay, I

can leave it with you now," added he, drawing out a leather case; "oblige me by writing your name here,—thank you." So saying, he handed some bank notes to Cumberland, carefully replaced the paper he had just signed in his pocket-book, and withdrew.

"Smithy was in great force to-night," observed Lawless, as the door closed behind him—"nicely they are bleeding that young ass Roberts among them—he has got into good hands to help him to get rid of his money, at all events. I don't believe Snaffles gave 40*l.* for that bay horse; he has got a decided curb on the off hock, if I ever saw one, and I fancy he's a little touched in the wind too, and there's another thing I should say—"

What other failing might be attributed to Mr. Roberts' bay steed, we were, however, not destined to learn, as tea was at this moment announced. In due time followed evening prayers, after which we retired for the night. Being very sleepy, I threw off my clothes, and jumped hastily into bed, by which act I became painfully aware of the presence of what a surgeon would term "certain foreign bodies;" i. e. not, as might be imagined, sundry French, German, and Italian corpses, but various hard substances, totally opposed to one's preconceived ideas of the component parts of a feather-bed. Sleep being out of the question on a couch so constituted, I immediately commenced an active search, in the course of which I succeeded in bringing to light two clothes-brushes, a boot-jack, a pair of spurs, Lempriere's Classical Dictionary, and a brick-bat. Having freed myself from these tormentors, I soon fell asleep, and passed (as it seemed to me) the whole night in dreaming that I was a pigeon, or thereabouts, and that Smithson, mounted on the top-booted Sphynx, was inciting Lawless to shoot at me with a red-hot poker!

As Coleman and I were standing at the window of the Pupils' room, about ten o'clock on the following morning, watching the vehicle destined to convey Dr. Mildman to the coach-office, Lawless made his appearance, prepared for his expedition, with his hunting-cos-tume effectually concealed under the new Macintosh—"Isn't Mildman gone yet? Deuce take it, what a time he is! I ought to be off—I'm too late already!" "They have not even put his carpet-bag in yet," said I. "Well, I shall make a bolt, and chance all about his seeing me," exclaimed Lawless; "he'll only think I'm going out for a walk rather earlier than usual, if he does catch a glimpse of me, so here's off." So saying he placed his hat upon his head, with the air of a man determined to do or die, and vanished. Fortune is currently reported to favour the brave, and so, to do her justice, she generally does: still, at the best of times, she is but a fickle jade; at all events she was determined to prove herself so in the present instance, for scarcely had Lawless got a dozen paces from the house, before Dr. Mildman appeared at the front door with his great coat and hat on, followed by Thomas bearing a carpet-bag and umbrella, and his attention being attracted by footsteps, he turned his head, and beheld Lawless. As soon as he perceived him, he gave a start of surprise, and pulling out his eye-glass, (he was rather short-sighted,) gazed long and fixedly after the retreating figure. At length, having apparently satisfied himself as to the identity of the person he was examining, he replaced his glass, stood for a moment, as if confounded by what he had seen, and then turning, abruptly, re-entered the house, and shut his study-door behind him with a bang, leaving Thomas and the fly-driver mute with astonishment. In about five minutes he re-appeared, and saying to Thomas, in a stern tone, "Let that note be given to Mr. Lawless the moment he returns," got into the fly and drove off.

"There's a precious go," observed Coleman; "I wonder what's in the wind now. I have not seen old Sam get up the steam like that since I have been here—he was not near so angry when I put Thomas's hat on the peg where he hangs his own, and he, never noticing the difference, put it on, and walked to Church in it, gold band and all." "I wouldn't be Lawless for something,"

observed I—"I wonder what the note's about!" "That's just what puzzles me," said Coleman. "I should have thought he had seen the pink, but that's impossible; he must have a penetrating glance indeed, if he could see through that Macintosh." "Lawless was too impatient," said Cumberland; "he should have waited a few minutes longer, and then Mildman would have gone off without knowing anything about him. Depend upon it the grand rule of life is to take things coolly, and wait for an opportunity: you have the game in your own hands then, and can take advantage of the follies and passions of others, instead of allowing them to avail themselves of yours." "In plain English, cheat instead of being cheated," put in Coleman. "You're not far wrong there, Freddy; the world's made up of knaves and fools—those who cheat, and those who are cheated, and I, for one, have no taste for being a fool," said Cumberland. "Nor I," said Mullins; "I should not like to be a fool at all; I had rather be—" "A Butterfly," interrupted Coleman, thereby astonishing Mullins to such a degree, that he remained silent for some moments, with his mouth wide open, as if in the act of speaking. "You cannot mean what you say; you surely would not wish to cheat people," said I to Cumberland; "if it were really true that one must be either a knave or a fool, I'm sure I'd rather be a fool—I'm sure you could never be happy if you cheated any one," continued I. "What does the Bible say about doing to others as you would have others do to you?"—"There, don't preach to me, you canting young prig," said Cumberland angrily, and immediately left the room. "You hit him pretty hard there," whispered Coleman; "a very bad piece of business happened just before I came, about his winning a lot of tin from a young fellow here, at billiards, and they do say that Cumberland did not play fairly. It was rather unlucky your saying it; he will be your enemy from henceforth, depend upon it. He never forgets nor forgives a thing of that sort." "I meant no harm by the remark," replied I; "I knew nothing of his having cheated any one; however I do not care; I don't like him, and I'm just as well pleased he should not like me. And now, as my foreign relations seem to be rapidly assuming a warlike character, (as the newspapers have it,) what do you say to giving me a lesson in sparring, as you proposed, by way of preparation?" "With all my heart," replied Coleman; and accordingly the gloves were produced, and my initiatory lesson in the pugilistic art commenced by Coleman's first placing me in an exceedingly uncomfortable attitude, and then very considerably knocking me out of it again, thereby depositing me with much skill and science flat upon the hearth-rug. This manœuvre he repeated with great success during some half hour or so, at the end of which time I began to discover the knack with which it was done, and proceeded to demonstrate the proficiency I was making, by a well-directed blow, which being delivered with much greater force than I had intended, sent Coleman flying across the room. Chancing to encounter Mullins in the course of his transit, he overturned that worthy against the table in the centre of the apartment, which, yielding to their combined weight, fell over with a grand crash, dragging them down with it, in the midst of an avalanche of books, papers, and inkstands.

This *grand coup* brought, as might be expected, our lesson to a close for the day, Coleman declaring that such another hit would inevitably knock him into the middle of next week, if not farther, and that he really should not feel justified in allowing such a serious interruption to study to take place. "And now, what are we going to do with ourselves?" asked I; "as this is a holiday, we ought to do something." "Are you fond of riding?" inquired Coleman. "Nothing I like better," replied I; "I have been used to it all my life; I have had a pony ever since I was four years old." "I wish I was used to it," said Coleman. "My Governor living in London, I never crossed a horse till I came here, and I'm a regular muff at it, but I want to learn; what do you

say to a ride this afternoon?" "Just the thing," said I, "if it is not too expensive for my pocket." "Oh, no," replied Coleman; "Snaffles lets horses at as cheap a rate as any one, and good 'uns to go too; does not he, Cumberland?" "Eh, what are you talking about?" said Cumberland, who had just entered the room; "Snaffles? Oh yes, he's the man for horse-flesh. Are you going to try and tumble off that fat little cob of his again, Fred?" "I was thinking of having another try," replied Coleman; "what do you say, Fairleigh? Never mind the tin, I daresay you have got plenty, and can get more when that's gone." "I have got a ten-pound note," answered I; "but that must last me all this quarter: however, we'll have our ride to-day." "I'll walk down with you," said Cumberland; "I'm going that way; besides it's worth a walk any day to see Coleman mount; it took him ten minutes the last time I saw him, and then he threw the wrong leg over, so that he turned his face to the tail." "*Scandalum magnatum!* not a true bill," replied Coleman. "Now, come along, Fairleigh, let's get ready, and be off."

During our walk down to Snaffles' stables, Cumberland (who seemed entirely to have forgotten my *mal à propos* remark) talked to me in a much more amiable manner than he had yet done; and the conversation naturally turning upon horses and riding, a theme always interesting to me, I was induced to enter into sundry details of my own exploits in that line. We reached the Livery Stables just as I had concluded a somewhat egotistical relation concerning a horse which a gentleman in our neighbourhood had bought for his invalid son, but which, proving at first rather too spirited, I had undertaken to ride every day for a month, in order to get him quiet; a feat I was rather proud of having satisfactorily accomplished. "Good morning, Mr. Snaffles; is Punch at home?" asked Coleman of a stout red-faced man, attired in a bright green Newmarket coat, and top boots. "Yes, Sir. Mr. Lawless told me your Governor was gone to town, so I kept him at home, thinking perhaps you would want him." "That's all right," said Coleman; "and here's my friend, Mr. Fairleigh, will want a nag too." "Proud to serve any gent as is a friend of yours, Mr. Coleman," replied Snaffles, with a bob of his head towards me, intended as a bow. "What stamp of a horse do you like, Sir? Most of my nags are out with the harriers to-day." "Snaffles, a word with you," interrupted Cumberland. "One moment, Sir," said Snaffles to me, as he crossed over to where Cumberland was standing. "Come and look at Punch; and let's hear what you think of him," said Coleman, drawing me towards Punch's stable. "What does Cumberland want with that man?" asked I. "What, Snaffles? I fancy he owes a bill here, and I dare say it is something about that." "Oh, is that all?" rejoined I. "Why, what did you think it was?" inquired Coleman. "Never mind," I replied; "let's look at Punch." And accordingly I was introduced to a little fat, round, jolly looking cob, about fourteen hands high, who appeared to me an equine counterpart of Coleman himself. After having duly praised and patted him, I turned to leave the stable, just as Cumberland and Snaffles were passing the door, and I caught the following words from the latter, who, appeared rather excited:—"Well, if any harm comes of it, Mr. Cumberland, you'll remember it's your doing, not mine." Cumberland's reply was inaudible, and Snaffles turned to me, saying, "I've only one horse at home likely to suit you, Sir; you'll find her rather high couraged, but Mr. Cumberland tells me you won't mind that." "I have been mentioning what a good rider you say you are," said Cumberland, laying a slight emphasis on the *say*. "Oh, I dare say she will do very well," replied I. "I suppose she has no vice about her." "Oh dear, no," said Snaffles, "nothing of the sort.—James," added he, calling to a helper, "saddle the chestnut mare, and bring her out directly." The man whom he addressed, and who was a fellow with a good humoured, honest face, became suddenly grave, as he

replied in a deprecatory tone, "The chestnut mare? Mad Bess, Sir?" "Don't repeat my words, but do as you are told," was the answer; and the man went away looking surly. After the interval of a few minutes, a stable door opposite was thrown open, and Mad Bess made her appearance, led by two grooms. She was a bright chestnut, with flowing mane and tail, about fifteen and a half hands high, nearly thorough-bred, and as handsome as a picture, but the restless motion of her eye disclosing the white, the ears laid back at the slightest sound, and a half-frightened, half-wild air, when any one went up to her, told a tale as to her temper, about which no one in the least accustomed to horses could doubt for an instant. "That mare is vicious," said I, as soon as I had looked at her. "Oh dear, no, Sir, as quiet as a lamb, I can assure you." "Soh, girl! soh!" said Snaffles, in a coaxing tone of voice, attempting to pat her; but Bess did not choose to "soh," if by "sohing" is meant, as I presume, standing still and behaving prettily, for on her master's approach she snorted, attempted to rear, and ran back, giving the men at her head as much as they could do to hold her. "She's a little fresh to-day; she was not out yesterday, but it's all play, pretty creature! nothing but play," continued Snaffles. "If you are afraid, Fairleigh, don't ride her," said Cumberland; "but I fancied from your conversation you were a bold rider, and did not mind a little spirit in a horse: you had better take her in again, Snaffles." "Leave her alone," cried I, quickly, (for I was becoming irritated by Cumberland's sneers, in spite of my attempt at self-control) "I'll ride her. I'm no more afraid than other people, nor do I mind a spirited horse, Cumberland, but that mare is more than spirited, she's ill-tempered,—look at her eye!" "Well, you had better not ride her, then," said Cumberland. "Yes, I will," replied I, for I was now thoroughly roused, and determined to go through with the affair, at all hazards. I was always, even as a boy, of a determined, or, as ill-natured people would call it, obstinate disposition, and I doubt whether I am entirely cured of the fault at the present time. "Please yourself; only mind, I have warned you not to ride her if you are afraid," said Cumberland. "A nice warning," replied I, turning away;—"who'll lend me a pair of spurs?" "I've got a pair here, Sir; if you'll step this way I'll put them on for you," said the man, whom I had heard addressed as "James"—adding, in a lower tone, as he buckled them on, "for Heaven's sake, young gentleman, don't mount that mare, unless you're a first-rate rider." "Why, what's the matter with her? does she kick?" inquired I. "She'll try and pitch you off, if possible, and if she can't do that, she'll bolt with you, and then the Lord have mercy upon you!" This was encouraging, certainly! "You are an honest fellow, James," replied I; "and I am much obliged to you. Ride her I must, my honour is at stake, but I'll be as careful as I can, and, if I come back safe you shall have half-a-crown." "Thank you, Sir," was the reply, "I shall be glad enough to see you come back, in any other way than on a shutter, without the money." Of a truth, the race of Job's comforters is not yet extinct, thought I, as I turned to look for Coleman, who had been up to this moment employed in superintending the saddling of Punch, and now made his appearance, leading that renowned steed by the bridle. "Why, Fairleigh, you are not going to ride that vicious brute to be sure; even Lawless won't mount her, and he does not mind what he rides in general." "Never mind about Lawless," said I, assuming an air of confidence I was very far from feeling; "she won't eat me I dare say." "I don't know that," rejoined Coleman, regarding Mad Bess with a look of horror; "Cumberland, don't let him mount her." "Nay, I can't prevent it; Fairleigh is his own master, and can do as he likes," was the answer. "Come, we can't keep the men standing here the whole day," said I to Coleman; "get on to Punch, and out of my way, as fast as you can, if you are going to do so at all"—a request with which, seeing I was quite determined, he

at length unwillingly complied, and having, after one or two failures, succeeded in getting his leg over the cob's broad back, he rode slowly out of the yard, and took up his station outside, in order to witness my proceedings. "Now, then," said I, "keep her as steady as you can for a minute, and as soon as I am fairly mounted give her her head—stand clear there." I then took a short run, and placing one hand on the saddle, while I seized a lock of the mane with the other, I sprang from the ground, and vaulted at once upon her back, without the aid of the stirrup, a feat I had learned from a groom who once lived with us, and which stood me in good stead on this occasion, as I thereby avoided a kick, with which Mad Bess greeted my approach. I next took up the reins as gently as I could, the man let go her head, and after a little dancing and capering, though much less than I had expected, her ladyship gave up hostilities for the present, and allowed me to ride her quietly up and down the yard. I then wished Cumberland, (who looked, as I thought, somewhat mortified,) a good afternoon, turned a deaf ear to the eulogies of Mr. Snaffles and his satellites, and proceeded to join Coleman. As I left the yard my friend James joined me, under the pretence of arranging my stirrup leather, when he took the opportunity of saying—"She'll go pretty well now you're once mounted, sir, as long as you can hold her with the snaffle, but if you are obliged to use the curb—look out for squalls!!!"

POPULAR YEAR BOOK.

May 17.—Rogation Sunday. (1846.)

THIS is always the fifth after Easter, and the next before Whit Sunday, and so called from the Latin word *rogare*, to beseech; because, on the succeeding Monday, Tuesday, and Wednesday, Rogations and Litanies were used, and fasting, or at least abstinence, enjoined by the Church, "for these reasons," says Bishop Sparrow: "I. Because this time of the year, the fruits of the earth are tender and easily hurt; therefore Litanies extraordinary are said to God, to avert this judgment. II. Because our Lord's Ascension is the Thursday following. Therefore, these three days before are to be spent in prayers and fasting, that so, the flesh being tamed, and the soul winged with fasting, we may ascend with CHRIST."

May 18, 19, 20.—The Rogation Days, (1846.)

The author of the "Popish Kingdom" thus describes the medieval manner of their observance in this country:

"Now comes the day wherein they gad abroad, with cross in hand,
To bounds of every field, and round about their neighbour's land;
And as they go, they sing and pray to every saint above,
But to our Lady specially, whom most of all they love;
When, as they to the town are come, the church they enter in,
And look what saint that church doth guide, they humbly pray to him,
That he preserve both corn and fruit from storm and tempest great,
And them defend from harm, and send them store of drink and meat.
These things three days continually are done with solemn sport,
With many crosses after they unto some church resort;
Whereas they all do chant aloud, whereby there strait doth spring
A bawling noise, while every man seeks highest for to sing."

"The custom," says Strutt, "of marking the boundaries of parishes by the inhabitants going round them once every year, and stopping at certain spots, to per-

form different ceremonies, in order that the localities might be impressed on the memories of both young and old, is of great antiquity. It is derived from the heathen feast, dedicated to the god Terminus, the guardian of the fields and landmarks. The priest of each parish, accompanied by his churchwardens and parishioners, bearing willow wands and banners, went round the limits of his parish on one of the three days before Holy Thursday, and stopped at remarkable spots and trees, to recite passages from the Gospels, and implore the blessing of the ALMIGHTY on the fruits of the earth, and for the preservation of the rights and properties of the parish. On these occasions, it was considered one of his chief duties to go to those of his flock whom he knew to be at variance, and, reconciling their differences, make them march side by side in the procession." It is recorded of Sir Thomas More that he would often walk in the Rogation perambulations. Once, when one of these was to go to the confines of the parish, he was requested, "for his state and dignity, to ease himself with a horse." His reply betokened his profound humility. He answered (alluding to the crucifix which was usually carried in front of these processions), "God forbid he should follow his Master prancing on cock-horse, when He went on foot."

The "golden legend" says, that the bearing of banners with the cross, on Rogation days, is to represent the victory of CHRIST in His resurrection and ascension: that the people followed the cross and the banners, as CHRIST was followed when He ascended to heaven with a great prey; and that in some churches, especially in France, it was the custom to bear a dragon, with a long tail, filled with chaff: the first two days it was borne *before* the cross, with the tail *full*; but on the third day it was borne *after* the cross, with the tail *empty*; by which it was understood, that on the first two days the devil reigned in the world, but that on the third he was dispossessed of his kingdom.

The "parochial perambulations" in Rogation week, survived the Reformation. Elizabeth's "advertisements" direct, "That in the Rogation days of procession, they sing or say, in English, the two psalms beginning, *Benedic anima mea*, &c., with the litany and suffrages thereunto, with one homily of thanksgiving to God, . . . without any superstitious ceremonies heretofore used." Hooker, it is related, "would by no means omit the customary time of procession, persuading all, both rich and poor, if they desired the preservation of love and their parish rights and liberties, to accompany him in his perambulation." The "vine" Herbert says of his "country parson," "Early he loves procession, and maintains it, there are contained therein four manifest advantages. First, a blessing of God for the fruits of the earth; secondly, justice, in the preservation of bounds; thirdly, charity, in loving, walking, and neighbourly accompanying one another; with reconciling of differences at that time, if there be any; fourthly, mercy, in relieving the poor, by a liberal distribution and largess, which at that time is, or ought to be, used."

This custom was particularly distasteful to the Puritans, one of whom, in 1572, among "Popish abuses," places "the gang week, when the priest in his surplice, singing gospels and making crosses, rangeth about in many places." Notwithstanding this, the practice retained its ground in many places, till a recent period, and, we believe, is not even yet entirely discontinued. A writer, in 1790, observes, "Some time in the spring, I think the day before Holy Thursday, all the clergy of Ripon, attended by the singing men and boys of the choir, perambulate the town in their canonicals, singing hymns; and the blue-coat charity boys follow, singing, with green boughs in their hands." The historian of Staffordshire, speaking of Wolverhampton, says, "Many of the older inhabitants can well remember when the sacrist, resident prebendaries, and members of the choir assembled at morning prayers, on Monday and

(1) See the Homilies.

Tuesday in Rogation week, with the charity children bearing long poles, clothed with all kinds of flowers then in season, and which were afterwards carried through the streets of the town with much solemnity; the clergy, singing men, and boys, dressed in their sacred vestments, closing the procession, and chanting, in a grave and appropriate melody, the Canticle, '*Benedicite omnia opera*,' &c. This usage was relinquished about 1765. In the skirts of the town are ranged, at determinate distances, a number of large trees, which serve to mark the limits between the township and the parish. These are denominated by the inhabitants *gospel trees*, from the practice of reading the gospel under them, when the clergy were wont to perambulate the boundaries." Plott, in his history of Oxfordshire, tells us that at Stanlake, in that county, the minister of the parish, in his procession in Rogation week, reads the gospel at a barrel's head, in the cellar of the Chequer Inn, in that town, where some say there was formerly a hermitage, others a cross, at which they read a gospel in former times. "At Oxford," says Brand, "at this time, the little crosses cut in the stones of buildings, to denote the division of the parishes, are whitened with chalk. Great numbers of boys, with peeled willow-rods in their hands, accompany the minister in the procession."

The village Rogation processions in other lands afford a remarkable instance of the innocent hilarities so closely connected with the Christian holidays. "The bells of the village church strike up," says Chateaubriand, "and the rustics immediately quit their various employments. The vine dresser descends the hill, the husbandman hastens from the plain, the woodcutter leaves the forest; the mothers, rallying from their huts, arrive with their children; and the young maidens relinquish their spinning-wheels, their sheep, and the fountains, to attend the rural festival. They assemble in the parish church-yard, on the verdant graves of their forefathers. The only ecclesiastic who is to take part in the ceremony soon appears. . . . He assembles his flock before the principal entrance of the church; he delivers a discourse, which must certainly be very impressive, to judge from the tears of his audience. He frequently repeats the words, *My children! my dearly beloved children!* And herein consists the whole secret of the eloquence of this rustic Chrysostom.

"The exhortation ended, the assembly begins to move off, singing, 'Ye shall go forth with pleasure, and ye shall be received with joy; the hills shall leap, and shall hear you with delight.'

"The standard of the saints, the antique banner of the days of chivalry, opens the procession; the villagers follow their pastor. They pursue their course through lanes, overshadowed with trees, and deeply cut by the wheels of the rustic vehicles; they climb over high barriers, formed by a single trunk of a tree; they proceed along a hedge of hawthorn, where the bee hums, where the bullfinch and the blackbird whistle. The budding trees display the promise of their fruit; all nature is a nosegay of flowers. The woods, the valleys, the rivers, the rocks, hear, in their turns, the hymns of the husbandmen, in their course through the plains, enamelled by the hand of their Creator. . . . To finish well a day so piously began, the old men of the village repair at night to converse with their pastor. The moon then sheds her last beams on their festival, which the Church has made to correspond with the return of the most pleasant of the months, and the course of the most mysterious of the constellations. Amid the silence of the woods arise unknown voices, as from the choir of rural angels, whose succour has been implored; and the plaintive and sweet notes of the nightingale salute the ears of the veterans, seated in friendly converse beneath the lofty poplars."

One or two old English customs observed in Rogation week, but unconnected with its peculiar usages, remain to be described. Hasted relates that at this season, at

Keston and Wickham, Kent, "a number of young men meet together, and with a 'most hideous noise,' run into the orchards, and, encircling each tree, pronounce these words:

"Stand fast root, bear well top;
God send us a youling sop,
Every twig apple big,
Every bough apple enow."

For which incantation the 'confused rabble' expect a gratuity in money, or drink, which is no less welcome; but if they are disappointed of both, they, with great solemnity, anathematize the owners and trees, with 'altogether as insignificant a curse.' This custom is called *youling*, and probably had a pagan origin.

Hutchins tells us "that the inhabitants of Shaftesbury have from time immemorial been supplied with water brought on horses' backs, or on people's heads, from three or four large wells, a quarter of a mile below the town, in the hamlet of Motcombe, and parish of Gillingham, on which account there is this particular ceremonial yearly observed by ancient agreement, dated 1662, between the lord of the manor of Gillingham, and the mayor and burgesses of Shaftesbury. The mayor is obliged on the Monday before Holy Thursday, to dress up a prize besom, or *byzant*, as they call it, somewhat like a May garland in form, with gold and peacock's feathers, and carry it to Enmore Green, half a mile below the town, in Motcombe, as an acknowledgment for the water; together with a raw calf's head, a pair of gloves, a gallon of beer, or ale, and two penny loaves of white wheaten bread, which the steward receives and carries away for his own use. The ceremony being over, the *byzant* is restored to the mayor, and brought back by one of his officers with great solemnity. It is generally so richly adorned with plate and jewels, borrowed from the neighbouring gentry, as to be worth not less than 1500*l*.

May 21st, 1846.—Holy Thursday, or Ascension Day.

This is one of the four most ancient festivals of the Church, and has always been regarded of apostolic institution. St. Augustine says, that it was celebrated throughout the whole world. Though with extraordinary pomp observed on the Mount of Olives, its solemn celebration was universal in the middle ages.

OLD AND POPULAR CUSTOMS.

A contributor to the *Gentleman's Magazine*, for 1787, states, "It is the custom in many villages in the neighbourhood of Exeter, to 'hail the lamb' upon ascension morn. That the figure of a lamb actually appears in the east upon this morning, is the popular persuasion." The following superstitions relating to this day are found in Scott's "Discovery of Witchcraft." "In some countries," he remarks, "they run out of the doors in time of tempest, blessing themselves with a cheese, whereupon was a cross made with a rope's end upon Ascension Day."—"Item, to hang an egg laid on Ascension Day in the roof of the house, preserveth the same from all hurts." On Holy Thursday "it is a common custom," says Hone, "of established usage, for the minister of each parish, followed by the boys of the parish school, headed by their master, to go in procession to the different parish boundaries; which boundaries the boys strike with peeled willow wands that they bear in their hands, and this is called beating the bounds." A sorry substitute for the old Rogation perambulations, and often attended by gross improprieties. *Bumping* persons to make them remember the parochial limits, is not unfrequently practised on these occasions. A few years since, an angler, in the Lea, was thus maltreated by the parishioners of Walthamstow, and obtained 50*l*. damages for the assault. Brand states, that on this festival, the magistrates, river-jury, &c., of the corporation of Newcastle-upon-Tyne, according to an ancient usage, make their annual procession by water, in their barges, visiting the bounds

of their jurisdiction on the river, to prevent encroachments.

RELIGIOUS OBSERVANCES.

In the afternoon of this day, before the Reformation, our ancestors assembled in the Churches, when, according to Barnaby Googe, a representation of our SAVIOUR was, in some places, drawn up to the roof, and a frightful image of Satan thrown down, upon which all the boys surrounded it, and "beat it into pieces small, to show their enmity." Then the Service proceeded, every versicle and every prayer concluding with the joyful Alleluia, and then, with the antiphon praying the promised gift of the Paraclete, "singing cakes" and unconsecrated wafers were distributed among the people, and the Office concluded. At Durham Abbey, they had a general procession, in which every monk wore a gorgeous cope, and the prior a "marvellous one" of cloth of gold, which was so heavy as to require support on every side. He held his pastoral staff and wore a precious mitre. St. Bede's shrine was carried by four monks on their shoulders. Other "holy relics" were borne in the procession, which was headed by St. Cuthbert's sacred banner, and two crosses, one of "silver parcel gilt," and the other, "all of gold."

It was formerly a practice at Lichfield on Ascension day, for the clergyman of the parish, accompanied by the church-wardens and sides-men, and followed by a concourse of children, bearing green boughs, to repair to the several reservoirs of water, and here read the gospel for the day, after which they were regaled with cakes and ale. During the ceremony the door of every house was decorated with an elm bough. This custom was founded on one of the early institutions of Christianity, that of blessing the wells and springs. An ancient and somewhat similar observance still prevails on Holy Thursday, in the village of Tissington, Derbyshire, which not only claims a high antiquity, but is one of the few country fêtes which are kept up with anything like the ancient spirit. It is called *well-flowering*. The following is an "exact account" of the circumstances attendant on this annual festival on the 8th of May, 1823. There are five wells, and the method of decorating them is this: the flowers are inserted in moist clay, and put upon boards cut in various forms, surrounded with boughs of laurel or white-thorn, so as to give an appearance of water issuing from small grottoes. The flowers are adjusted and arranged in various patterns to give the effect of mosaic work, having inscribed upon them texts of scripture, appropriate to the season, and sentences expressive of the kindness of the DEITY. They vary each year, and as the wells are dressed by persons contiguous to the springs, so their ideas vary. A sermon was preached on the above occasion, from 1 Peter iii. 22. From the church the congregation walked in procession to the first, or the Hall well; so called from being opposite to the house of the ancient family of Fitzherbert. Here was read by the clergyman the first Psalm for the day, and another sung by the parish choir. As there is a recess at the back of the well, and an elevated wall, a great profusion of laurel-branches were placed upon it, interspersed with daffodils, Chinese roses, and marsh-marygolds. Over the spring was a square board, surmounted with a crown, composed of white and red daisies. The board, being covered with moss, had written upon it in red daisies, "While He blessed them He was carried up into heaven." The second, or Hand's well, was also surmounted with laurel-branches, and had a canopy, with, "The Lord's unsparing hand supports us from this spring." The letters were formed with the bud of the larch, and between the lines were two rows of purple primroses and marsh-marygolds. In the centre above the spring, on a moss ground, in letters of white daisies, "Sons of earth, the triumph join." Beneath, was formed in auriculars "G. R." The second Psalm for the day was read here. The third, or Frith's well, was greatly admired, as it was situated in Mr. Frith's garden, and the shrubs around it were numerous.

Here were formed two arches, one within the other. The first had a ground of white hyacinths, and purple primroses, edged with white, on which was inscribed in red daisies, "Ascension." The receding arch was covered with various flowers, and in the centre on a ground of marsh-marygolds edged with white hyacinths, in red daisies, "Peace be unto you." Here was read the third Psalm for the day. The fourth, or Holland's well, was thickly surrounded with branches of white-thorn placed in the earth. The well springs from a small coppice of firs and thorns. The form of the erection over it was a circular arch, and in the centre, on a ground of marsh-marygolds edged with purple primroses, in red daisies, these words, "In God is all." At this well was read the Epistle. The fifth, or Miss Goodwin's well, was surrounded with branches of evergreens, having, on a pointed arch, covered with marsh-marygolds, daffodils, and wild hyacinths, "He did no sin," in red daisies. On the summit of the arch was placed a crown of laurel, over which was a cross of white daisies, edged with wild hyacinths; on the transverse piece of the cross, "I. H. S." was placed in red daisies. At this well was read the Gospel. The day concluded by the visitors partaking of the hospitality of the inhabitants, and being gratified with a well-arranged band, playing appropriate pieces of music at each other's houses.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE VILLAGE SMITHY.¹

SHELTERED well by friendly mountains,
Wash'd by clear and cooling fountains,
In a nook so still and green,
Lovelier hamlet ne'er was seen.

Overhead, on ridges high,
Old dark pine-trees hide the sky;
Down below, the stream flows near,
And the air is mild and clear.

House and yard swarm all day long
With a busy bustling throng;
Ever as the day comes round,
Rings the anvil's restless sound.

And the bright sparks dart and quiver,
And the steely splinters shiver,
And the flood, with thunder-sound,
Flings the ponderous mill-wheel round.

Earthly cares shall not molest,
In this vale, my peaceful breast;
Joy within my heart shall dwell,
As a pure, untroubled well.

Shaded by the whispering trees,
Will I woo the dreamy breeze;
Mountain, vale, and murmuring rill,
With deep peace my heart shall fill.

Körner.

SONNETS

Illustrating the development of poetical talent in a working man.

H. F. LOTT.

I.

OF Poetry, our simple ballad lore
Long form'd my only library, till the page
Of unsurpass'd Shakspeare did engage
Mine eye, its depths of treasure to explore:
My favourites were, the much beguiled Moor,
And the fair victim of his jealous rage,—
Romeo and Juliet; and upon the stage
Of martial heroes, him of Agincour.
But much of what was nature seem'd uncouth,
Far as my folded faculties could see,
And fail'd to strike my inexperienced youth
Either with sweetness or sublimity;
Till by degrees its beauty and its truth
Won, and still wins, my deep idolatry.

II.

NEXT Burns's light upon me shone, and smiled
In manly sentiment and loving song;
And o'er his lyrics I delighted hung,
When woman's beauty first my heart beguiled.
Eliza! Thou rememberest how wild
My transports were, how tender, deep, and strong
The love that burn'd within me, and how long
Passion and peace remain'd unreconciled.
His proud unbent integrity of mind,
His wit and satire spurning every rein,
His worship and his love of womankind,
The troubles that he struggled with in vain,
Claim'd all my sympathy; and deep enshrin'd
In memory's temple his most touching strain.

III.

AND then the paintings of The Seasons led
My soul to contemplation, and I stood
In open landscape, and embow'ring wood,
Enchanted with the wonders round me spread:
Imbibing sentiment from all I read,
And musing on it, I became embued
With sense of all the beautiful and good,
That heaven on earth so bountifully had shed.
The flowers grew lovelier, sweeter; birds and streams
Warbled and murmur'd softer in mine ear.
The morning's radiance—evening's glowing beams,
The voiceful winds, the moon, each glittering sphere,
Woke in my mind enthusiastic dreams,
Which Fancy idealizing, rendered dear.

IV.

CHARM'D was I now by rich melodious Pope:
By Mentor Cowper pointed to the right;
And sooth'd or lifted up by Henry White.
Then saw the portals of the heavens ope,
Through Milton's genius, which alone could cope
With so sublime a theme; and heard Young slight
The selfish world, in which he took delight;
And wept for very joy o'er Campbell's Hope!
And Bloomfield's watching spirit pleas'd has been
To see me lie upon the daisied grass,
Fancying I saw his faithful painted scene
Reflected round me, as if in a glass:
And Butler's shade, too, might have heard, I ween,
My laughter o'er his matchless Hudibras.

V.

FINALLY, Byron warm'd me with his fire,
And in a magic spell my feelings held,
Till the strong impulse could no more be quell'd,
And artlessly and low I woke my lyre,
Where few could hear its breathings; or the mire
Of deep obscurity its efforts hid,
Or cool indifference every hope forbid,
Further to mount to where it would aspire.
Since then, some humble channels opening round,
Invite a simple bard like me to send
His bubbles on the sea, to float or drown,
As critics may destroy them or befriend;
And should these meet the last, then have I found,
The effort well rewarded by the end.

VI.

YET, some may deem my numbers sounding shells
That merely echo back another's thought,
Into a different tone of language wrought
As memory moveth, or as passion swells:
But if I be no poet, deeply dwells
The love of song within me—ever fraught
With an intense delight, when I have sought
Those springs where its pure spirit most out-wells,
And drunk, yet was not blinded by the charm,
So as to lead my youthful mind astray,
Nor for my daily toil unfit my arm;
But so has drawn me from the evil way
That even those around me could but say—
“How it expands his heart and keeps it warm.”

Miscellaneous.

“I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them.”—*Montaigne*.

IMPORTANCE OF HUMILITY.

DR. FRANKLIN ONCE received a very useful lesson from Dr. Cotton Mather, which he thus relates, in a letter to his son. “The last time I saw your father was in 1724. On taking my leave, he showed me a a shorter way out of the house, by a narrow passage which was crossed by a beam over-head. We were still talking, as I withdrew, he accompanying me behind, and I turning towards him, when he said hastily, “Stoop! Stoop!” I did not understand him till I felt my head hit against the beam. He was a man who never missed an opportunity of giving instruction; and upon this, he said to me, “You are young, and have the world before you, *learn to stoop* as you go through it, and you will miss many hard thumps.” This advice thus beat into my head, has frequently been of use to me; and I often think, when I see pride mortified, and misfortunes brought on people by their carrying their heads too high.

THIS too is a very principal point to attend to—knowledge how to converse: to interrogate without over-earnestness; to answer without desire of display: not to interrupt a profitable speaker, or to desire ambitiously to put in a word of one's own: to be measured in speaking and hearing: not to be ashamed of receiving, or to be grudging in giving, information, nor to pass another's knowledge for one's own. The middle tone of voice is best, neither so low as to be inaudible, nor ill-bred from its high pitch. One should reflect first what one is going to say, and then give it utterance: be courteous when addressed, amiable in social intercourse: not aiming to be pleasant by facetiousness, but cultivating gentleness in kind admonitions. Harshness is ever to be put aside, even in censuring.—*Church of the Fathers*.

THOSE who most doubt friendship, are precisely those the least calculated to excite or feel it.

THE SEIKS AND THE SINGHS.

(FIRST ARTICLE.)

It has long been evident to every one who has surveyed the map of Hindostan with an attentive eye, or known anything of the history of that vast country, that the district called the Punjaub must, sooner or later, be placed under the control of the British government. And this for several reasons, amongst the most cogent of which were the protection from attack of the territories on the left bank of the Sutlej, which have for some time past sought and received our guardianship; the introduction of peace and civilization amongst tribes of people living in a state of confusion and barbarism; and the consolidation of our own empire within a well defined northern frontier. The expediency of our extending a mild but strong rule to that province, of replacing anarchy by regulation, and distraction by tranquillity, has been long felt, and the

accomplishment of the desirable end was foreseen to be not far distant. Any doubts as to the absolute necessity of our interference have at length been swept away by a hostile incursion on the part of the inhabitants of the Punjaub, and we shall in all probability hear in a short time of the addition of another kingdom to the power and wealth of the British dominion in the East.¹ Meanwhile it may be interesting to our readers to have a succinct account of the country, and of the people dwelling there; and this we propose to give them in these papers, in the preparation of which we have carefully consulted the latest and best authorities.

For a great number of years, indeed from the commencement of authentic history, up to a very recent period, the Punjaub territory had no independent government of its own. The earliest

(1) The opinion here expressed will be understood to be that of the writer of this paper only. We view the matter differently, and sincerely rejoice in the prospect that his anticipations will not be realized.—EDITOR.

account we have of it is derived from a Hindu volume, which denounces the inhabitants as an impure race, because they ate beef, drank arrack, and paid no attention to caste. Their name, Bahikas, was derived from two demons who dwelt upon the banks of one of the rivers. It was always a mere province of some vaster empire. Towards the end of the fifteenth century, it was an appanage of the Mogul dynasty, and, whilst the emperor lay lapt in luxury at Delhi, a viceroy was stationed at Lahore to defend his sovereign's dominions on the north and west. This dynasty was established by Baber, a warlike Turcoman prince, who advanced upon Delhi about 1527, and dethroned the Afghan then seated on the throne of northern Hindostan. It is a strange misnomer that has crept into history, to style Baber and his successors Moguls, that is Mongols, for the fact is they were not Mongols, but princes of a Turki tribe. The mistake originated from Baber having many Mongols in his train when he effected his conquests, and from his being the successor of Timur, "the Axis of the Faith, the great Wolf, the Master of Time," (better known to us under the name of Tamerlane) who succeeded in uniting the fragments of the old Mongol empire of Gengis Khan. The religion of the Moguls was Mohamedan, but a great number of their subjects were Hindoos. In the year 1469 there was born near Lahore a man called Nanac Shah. He was a Hindoo of the warrior caste, and, even in his childhood, his mind had a strong religious tendency, exhibiting itself in an indifference to worldly pursuits, and in acts of charity: at least so the writers of the sect he founded assert; and they cite instances of miraculous interposition as additional proofs of his sanctity. For instance, as he was tending cattle one day in the fields, he fell asleep under a tree, and he continued in slumber until the shade which had protected him from the sun's influence had moved away, and the solar rays fell upon him. But the Ruler of the world intended him for great things, and, in order to prevent the fatal effects that might have ensued from the youth's exposure to a hot sun, a snake moved out of an adjoining bush, and, raising itself on its tail, spread its hood over Nanac like a screen until the set of day. The governor of the district happened to pass by as the snake was thus employed, and marked with attention this augury of future greatness, as unequivocal and certain as that of the eagle in the sight of a Roman Aruspex. Nanac became a Fakir, and practised all kinds of austerities, after the approved fanatic fashion. He performed pilgrimages not only to the holy places of the Hindoos, but to those of the Mohamedans likewise, and in his travels he preached his own doctrines respecting the unity and omnipresence of the Supreme Being, endeavouring to reconcile the conflicting creeds of Brahma and Mohamed by enforcing attention to the one point whereon they theoretically agreed. He sought to impress upon his hearers a regard for purity of life, and peace with all men. He boldly condemned the propagation of any form of belief by means of the sword, and thereby excited the hatred of the Mohamedans. "I am sent," he declared, "from heaven to publish unto mankind a book, which shall reduce all the names given unto God to one name, which is God, and he who calls him by any other shall fall into the path of the devil, and have his feet

bound in the chain of wretchedness." Again he said: "Without the practice of true piety, both Hindoos and Moslems are in error, and neither will be acceptable before the throne of God; for the faded tinge of scarlet that has been soiled by water will never return. Reading is useless without obedience to the doctrine taught, for God has said, no man shall be saved except he has performed good works. The Almighty will not ask to what tribe or persuasion he belongs: He will only ask what he has done." High and low, perceiving he was in earnest, listened to him with attention, and he was even permitted to expound his tenets before the emperor Baber. During the progress of his pretended apostolical mission, he was assailed with fierce threats as well as bland temptations; nevertheless he remained immovable. A Rajah offered him all the luxuries of the world if he would abandon his object; but rich meats, splendid clothing, and fair women, were appropriate texts upon which Nanac could enlarge, and he contrasted the purity of his doctrines with the vain, sinful practices of the world, in words of such eloquence and force, that the Rajah himself was converted to the new faith. At another time, when he visited the country of the Yogis-waras, (recluses, who by means of penances were believed to have obtained command over the powers of nature,) all the means they possessed were employed to terrify him from his course. Dire enchantments appeared before him under the terrible shapes of lions, tigers, and snakes; showers of fire fell from heaven, and the stars were torn down from the firmament. He died at Kirtipoor, on the Ravee, and was buried on the banks of that river. The waters of the stream now run over the place of his interment, but Kirtipoor, where he performed many miracles, is resorted to by devotees to this day, and a fragment of his garment is the only tangible memorial of the departed Nanac that his pious followers can exhibit in proof that he once lived. There is, to be sure, a treatise of his writing called *Granth*, (meaning the Book,) but that is consulted as little as may be, for the doctrines it teaches differ to an uncomfortable extent from the present practices of the Seiks, the name adopted by the followers of Nanac, derived from a Sanscrit word, signifying disciple. Though a great part of Asia was visited by Nanac, his system seems only to have taken lasting root in the district where he was born. Whilst he lived he was looked upon as spiritual head of his sect, and he was followed by nine persons who successively assumed the name of *Gooroo* (that is, spiritual instructor), all of whom supported their position by affecting superior sanctity, and performing pretended miracles. Several of these leaders made additions to, or modified, the established creed, and there are in consequence many sects in the Seik church. We need not trace the history of the Gooroos, or of the alterations they introduced; but it is proper to mention that the most important of these alterations was made by Govind, the tenth Gooroo, who repudiated the quietism of Nanac, and put a sword into the hands of his adherents, changing their name from *Seik* to *Singh*, or lion. In order to distinguish his followers from their neighbours, he commanded them to allow their hair and beard to grow, and to attire themselves in blue garments. To swell their number he abolished the invidious distinction of caste, permitting all classes to enrol themselves

Seiks who chose to abandon their previous belief. The eating of flesh, except that of kine, was no longer forbidden, and hence pork, which is an abomination to the Mohamedans, is freely consumed by the Seiks. Govind wrote another *Granth*, which does not exclusively relate to religious subjects, for there are in it many narrations of its author's warlike achievements, and he traces the descent of his own tribe and the progress of his own life.

The religion founded by Nanac professed to combine the leading axioms and excellent points both of the institutes of Hindooism, and the laws of Mohamed. Yet we may perceive even in the beginning, that its leaning was towards the ancient faith of Hindostan, and the corruptions that in progress of time crept in were strongly tinged by the superstitions which surrounded the antique gods. Thus the cow, which is an object of reverence wherever the religion of Brahma and his fellow deities prevails, is worshipped by the Seiks. The great body of Hindoo mythological fiction is adopted, the efficacy of penance is insisted on, the holy books of Brahminism are consulted, the great festivals of the Hindoos observed, and their sacred shrines attended. This sympathy with the Hindoos was partly the cause, and partly the effect, of the persecutions the Seiks had to endure from the Mohamedans, persecutions which, in the end, rendered necessary some kind of defensive organization. The result of Govind's rule was to convert the whole body of his followers into a tribe of armed warriors. The struggles they made for mere existence tested their strength, and showed the weakness of their adversaries, so that, after a time, they found themselves in a position to take possession of the Punjaub country. But to give a clear explanation of the history of the Seiks, it will be necessary to go back a little, and state the circumstances of the surrounding countries.

The Mogul empire, founded by Baber, attained to the zenith of its prosperity under Aurungzebe. At that monarch's death, which took place in 1707, a series of princes sat in the *musnud* who were incapable of withstanding attacks from without, or of resisting treason within the limits of their vast dominions. In the short space of thirteen years after Aurungzebe had been gathered to his fathers, four different kings ruled northern Hindostan, and then Mohamed Shah was proclaimed supreme head. He was a pusillanimous monarch, given up to sensual pleasures, and destitute of any skill in the art of governing. Ever ready to purchase peace, he found that the money expended in this base purpose drained his coffers, without ensuring the quiet he sought. One-fourth of his revenues had been alienated in this way when Nadir Shah made his appearance, and inflicted a blow from which the empire never recovered. Nadir was a soldier of fortune, who had raised himself from a subordinate situation to the throne of Persia. His father was the chief of the tribe of the Giljees, seated in that part of Afghanistan which is close adjoining upon the Punjaub. Afghanistan at that period belonged to Persia. After having given incontestable proofs of his valour, his services were engaged by the Persian monarch, and, when the Afghan tribes arose in rebellion and audaciously entered the Shah's kingdom, he was employed against them and expelled them with great slaughter. Troubles in other quarters threatened

the very being of the Persian kingdom, which the Shah, an effeminate person, was unable to ward off, and had not Nadir given his whole strength to its support, the throne would have tottered into the dust. Nadir had the policy to conceal his ambitious views for a time, but a convenient opportunity occurring, he procured himself to be elected king. This event did not stop him from indulging his bent for war, and, immediately after his coronation, he marched against the rebellious Afghans, whom he reduced to obedience. Whilst still in Afghanistan, reports of the weakness and the wealth of the Delhi monarch reached him, nor was he long before he found a pretence for indulging his love of conquest by an attack upon the country south of the Indus. Some Afghans had fled for protection into the Mogul empire, and Nadir demanded that they should be given up to him. No attention was paid by the proud Mogul to the demand, and Nadir at once determined to march his troops into his country. A battle was fought, in which the Indian troops were irretrievably routed, and Mahomed Shah voluntarily threw himself upon the mercy of the conqueror. They proceeded together to Delhi, Nadir ostensibly as the guest of Mahomed; and the sums claimed by the Persians were only under the name of indemnification for the expenses of the war. The inhabitants of Delhi were in the depths of despair at the enormous amount of the levies, and a false report of Nadir's death having been circulated, they rose in arms and attacked the Persian soldiers. No explanation would satisfy Nadir; he saw at a glance his precarious situation, and in order to strike such a terror as would paralyze them for the future, he ordered a general massacre, in which, though it continued only from sunrise till noon, an immense number of persons was slaughtered. The plunder that Nadir extorted was enormous, and when he returned to Persia it is calculated that he carried with him somewhere between thirty and seventy millions sterling. Nadir afterwards exhibited such cruelty in his own kingdom, that madness alone can account for his conduct, and his death became a matter of absolute necessity. Ahmed Khan, one of Nadir's officers, and chief of an Afghan tribe, took advantage of the crisis to found the kingdom of Afghanistan, by making himself master of Kandahar, and assuming the title of king. Like Nadir, Ahmed perceived that the best method of keeping his title unquestioned, was to employ his people in predatory wars, and his first impulse was to march upon Delhi; for the recollection of the impotence of the Mogul had not faded from his memory, since he had visited that capital in the train of the late Shah. He was, however, so vigorously opposed by the viceroy of the Punjaub, that he determined upon a retreat, reserving the full force of his attack for a more convenient season. Ahmed's next invasion (1751) was attended with greater success. The viceroy sustained a defeat near his capital, and tendered his submission. Ahmed continued his government, however, but it was as his own viceroy. During the troubles that besieged the unfortunate Punjaub, the Seiks had rendered themselves a formidable body; and although measures were taken to suppress them, they increased in numbers and strength. Ahmed had no longer much to fear from the Mogul emperor, but the Mahrattas now made their appearance, and the viceroy fled at their approach.

Ahmed took the field in person, and the great battle of Paniput was fought in 1761, in which the new invaders were utterly routed. After this "wild Mahratta battle," the Seiks securing themselves in several strongholds began to make head against the Afghans, and although they were repeatedly punished, they succeeded at last in establishing themselves masters of the Punjaub.

The relation of the Seiks to each other seems, at this time, to be as nearly that of the feudal warriors of Europe as we can well conceive. The chiefs were numerous, and they acknowledged no supreme head, but were linked together for mutual benefit. A chain of mutual dependence bound together the subordinate officers with those above them, and the ties of kinship and clanship had as much to do in keeping the bodies united, as the hopes of reward. In fact, the members of the Seik association considered themselves partners in their enterprises, but it was necessary, to ensure success, that some should lead and some should follow. The chiefs, of whom there were twelve, took the name of Misuls, and of these Chooroot Singh was amongst the most powerful. Of course, in such a state of society, there were many temptations and opportunities for an enterprising warrior to distinguish himself. It is true that a sort of council was constituted called Gooroo Matta, by which a federative form was nominally given to the Seik commonwealth, but intrigues prevailed to such an extent amongst the Misuls, that it was virtually inoperative. Maha Singh, Chooroot's son, was of a bold, energetic disposition, and the bravery he exhibited on divers occasions attached several independent Sirdars to him, and ingratiated him so much with the people that none of his fellow chiefs could rival his influence. Having thus obtained the ascendancy, he was wise enough to use his power for the good of his country; and it is said that a period of repose and tranquillity was the consequence, to which the Punjaub had long been a stranger. Maha Singh died at the age of twenty-seven, and his only son, Runjeet, was but twelve years old when his father's early death took place. At that age it was not to be expected that he would have either capacity in himself, or the permission of his elders, to undertake the management of affairs; but when he arrived at the termination of his sixteenth year, he dissolved the body that had governed during his minority, and assumed his father's seat. In the meantime Shah Zemaun, who was then chief of the Afghanistan country, had crossed the Indus, and invaded the Punjaub. He repeated his attack soon after Runjeet had taken upon himself the conduct of affairs, but, as he found he could not permanently occupy the country, he retreated once more. Runjeet rendered the Shah some services, and he solicited, in return, a grant of Lahore, which he readily obtained. From the time of his taking possession of that city, Runjeet may be considered as having founded the kingdom, to which he was continually adding for some years. We reserve, however, an account of his proceedings for another paper.

LIFE AND WRITINGS OF SCHILLER.

(Continued from page 21.)

HISTORY, next to poetry, was Schiller's favourite employment; and he now occupied himself in an eminently congenial work, and that on which his reputation, as a prose writer, is chiefly founded;—*The History of the Thirty Years' War*. This work appeared in Göschen's Historical Almanack. This passage of history, from its poetical character, had always a peculiar charm for Schiller; and various were his poetical projects in connexion with it. They resulted at length in the noblest productions of his pen, the two tragedies on the subject of Wallenstein. It is remarkable that, during this latter task, he had much less confidence in his poetic powers, criticized his former writings with severity, and acknowledged that he had become a new man in poetry. The truth was, his taste had grown severer, and his judgment riper, and his mind had been disciplined by the study of the ancients; in particular of Aristotle, whom he had found to differ far from the French theories ascribed to him. Schiller's genius was never more vigorous or brilliant, but it was now under guidance and command. The "Wallenstein" occupied seven years. During this period, the French Revolution was approaching its bloody crisis. Schiller gave the most unquestionable proof of his hostility to its barbarous principles by projecting an address to the French people in favour of their monarch, monarchy, order, and religion; a project which was not executed only because he could meet with no person who would undertake to translate his intended work into French. In 1793, the poet revisited the scenes and companions of his youth, having previously ascertained that the Duke of Württemberg would not interfere with his residence at Stuttgart. His meeting with his parents was productive of great joy and thankfulness to all parties.

On his return to Jena, Schiller conceived a new literary project. He had formed an intimacy with William von Humboldt, (brother of the celebrated traveller,) who was then at Jena, and in concert with him, and his more distinguished friend Goethe, he started a periodical called "Die Horen," to which the most eminent literary men of Germany contributed. This was a fertile period with our poet, who contributed largely to this work, and to "The Almanack of the Muses," while he continued to labour energetically at "Wallenstein." This period also produced the "Xenien," a collection of varied epigrams, which have widely influenced the literature of Germany; and the ballads, which are some of the most attractive of Schiller's writings, were the result of a friendly rivalry with Goethe about this time. "Wallenstein" saw the light in 1797. Two portions of this magnificent work are well known to English readers, in the no less magnificent translation of Coleridge. It consists of three parts; the first called "Wallenstein's Camp," introductory, which Coleridge has not rendered, as it adds nothing to the dramatic interest. It is not, however, without its uses; as depicting the licence and turbulence of Wallenstein's soldiery, and inspiring the reader with a high idea of the commanding intellect and military tact which restrained so many thousands of lawless and discordant spirits, not only in subordination, but attachment. It has, moreover, somewhat the same relation to the following parts that the Satyrical Drama had to Tragedy among the Greeks. The other divisions of the poem are intitled "The Piccolomini," and "The Death of Wallenstein." The towering ambition, and all-mastering genius of the hero—the cold steady loyalty of Octavio Piccolomini, which all that genius is powerless to touch—the high, confiding, devoted spirit of his son, who will

not abandon Wallenstein till his treason is palpable, and then hesitates not to sacrifice all for his sovereign—the gentle beauty and devotedness of Thekla—these are pictures which have never been surpassed.

About this time, Schiller changed his winter abode to Weimar, in order that, in conjunction with his friend Goethe, he might direct the theatre there, according to the taste and opinions of both. At Jena he bought a garden, in the midst of which he built a small house, to which he betook himself in the summer, to have leisure and opportunity for composition. But he afterwards settled entirely at Weimar. The reigning duke continued and increased the pension bestowed by the Danish prince, though Schiller's literary successes placed him beyond the need of it.

"Wallenstein" was followed in rapid succession by his other plays. "Mary Stuart" appeared in 1800; "The Maid of Orleans" in 1801; "The Bride of Messina" in 1803; "William Tell" in 1804. During this period he translated Shakspeare's "Macbeth," Gozzi's "Turandot," and Racine's "Phædra," beside some other pieces. While occupied in the tragedy of "Demetrius," a severe return of his complaint ended his life on the 9th of May, 1805. His death exemplified tranquillity and hope. He was, as has been above observed, a different man after the first accession of his illness; and the teaching he had received from his first affliction was yet further improved by others. In the last ten years of his life he lost his sister, father, and mother; the two former in the same year (1796.) "He felt both losses acutely," says Sir Bulwer Lytton; "the last perhaps the most; but in his letters it pleases us to see the philosopher return to the old childlike faith in God, the reliance on divine goodness for support in grief, the trust in divine mercy for the life to come. For it has been remarked with justice, that, while Schiller's *reason* is often troubled in regard to the fundamental truths of religion, his *heart* is always clear. The moment death strikes upon his affections, the phraseology of the schools vanishes from his lips—its cavils and scruples from his mind; and he comforts himself and his fellow mourners with the simple lessons of gospel resignation and gospel hope." It is singular that the writer of this passage failed to perceive that the philosophy which Schiller found powerless to console affliction, could scarcely have been that which aided him so effectually in the trying season of incipient disease.

A few words on some of his latest dramas must conclude this memoir. While we cannot concur in the censure which Sir Bulwer Lytton passes on the "Mary Stuart," there can, we think, be no question of its inferiority to "The Maid of Orleans." "Mary Stuart" is a beautiful creature of imagination; for such we must call her, notwithstanding her historical name; as, without entering on the much litigated question of Mary's real conduct under several suspicious circumstances, the poetical Mary is certainly much more than childlike ideal perfection which Schiller loved to contemplate, than the nursling of courts and the directress and intimate of statesmen. Nor, indeed, is the character strictly self-consistent; for it embraces, in some degree, the latter view. "Joanna" is still further removed from the Joan of history, than Mary from her historical prototype; but she is altogether a character of a higher order, and appears to have been drawn with higher views, to exemplify and teach exalted truth. It is difficult to conceive that Schiller's mind, while occupied with this poem, was not deeply influenced by spiritual religion; that he did not feel what he evidently so well understood. Besides, it was his avowed intention, not without a lingering of his early predilections, to make the stage a kind of pulpit, and inculcate from it a Christian morality. And the "Maid of Orleans" has done even more. The blessing of obedience, the evil of the smallest sin, the necessity and blessedness of contrition, are there depicted in the liveliest colours. "The Bride of Messina" is an attempt to

familiarize the modern stage with the chorus. Its plot is simple, but unpleasing. The lyrical portions are of consummate beauty. "William Tell" is the impersonation of civil liberty, as "Joanna" is of spiritual religion. He is of a very different order from Charles Moorin "The Robbers;" and, indeed, but for the assassination of the tyrant, he might stand as a noble representative of the abstraction. The catastrophe was historical, yet we know that Schiller did not consider his fictions necessarily to be limited by history. But, as Sir Bulwer Lytton truly remarks, "throughout the whole breathes the condemnation of the French anarchy."

In a sketch of this kind we have necessarily left unnoticed great numbers of pieces, both in prose and verse, the productions of Schiller's fertile pen. Of the general character of his works we would say with Sir Bulwer Lytton, "The whole scope and tendency of his writings, taken one with the other, are eminently christian. No German writer, no writer not simply theological, has done more to increase, to widen, and to sanctify, the reverential disposition that inclines to Faith." This is saying much for one educated in the imperfect system of German Protestantism, and exposed to metaphysical temptation in no ordinary degree.

We conclude this article with a few extracts from Schiller's dramatic productions.

BOYISH FRIENDSHIP.

DON CARLOS, Act 1. Scene 2.

(Translation of Charles Herbert Cottrell, Esq.)

CARLOS.

Ah! let me weep, and on thy bosom shed
A flood of burning tears, my only friend.
I possess none—none—none on this wide earth.
In the broad realms my father's sceptre sways,
The expanse of waters where our flag's unfurled,
'There is no place—none else—where I could dare
By tears to lighten my o'erburdened soul.
I charge thee, Roderick, by all that thou
And I hereafter hope in heaven above,
Dispel me not from this beloved spot!

[The Marquis bends over him in speechless emotion.]

Persuade thyself I am an orphan child,
Whom thy compassion raised up by the throne.
'Truly I know not what a father means—
I am a king's son.—O should it occur,
What my heart whispers, should'st thou be alone
'Mong millions found to understand my state;
Should it be true, that Nature's parent hand
In Carlos re-created Roderick,
And in the morning of our life awoke
The sympathetic chord which joins our souls—
O! if the tear which mitigates my grief
Be dearer to thee than my father's smiles—

MARQUIS.

'Tis dearer far than all the world besides.

CARLOS.

So low I'm fallen, and so poor I'm grown,
That I must conjure up our childhood's years—
That I must sue thee to discharge the debts,
Forgotten long, in infancy contracted—
When thou and I, two wild boys as we were,
Grew up as brothers, my one sorrow was
To feel my talents thus eclipsed by thine;
Then I resolved to love thee without bounds,
Because I had not courage to be like thee.
Hereon began I to torment thee with
A thousand tender pledges of my love,
Which thy proud heart returned with chilling cold.
Oft stood I there—yet thou observed'st it not!
Hot, heavy tear-drops hanging on mine eye,
If thou ran'st by me, and with open arms
Press'd'st to thy bosom some inferior friends.
'Why only these?' I mournfully exclaimed:
'Do I not also dearly love thee too?'
Thou ceremoniously and coldly knelt'st;
'That,' thou observed'st, 'is due to the King's son.'

MARQUIS.

O! cease, Prince, from these boyish recollections,
Which make me still red with the blush of shame.

CARLOS.

This did I merit not from thee. Despise
Thou might'st, and deeply wound my heart, but ne'er
Estrange it from thee. Thrice this Prince repulsed,—
Thrice he came back to thee a suppliant,
T' implore thy love, and force his own on thee.
Chance brought about, what Carlos ne'er could do—
It happened in our games thy shuttlecock
Struck in the eye, my aunt, Bohemia's Queen—
She thought 'twas done intentionally, and,
Suffused in tears, complained unto the King.
All the young courtiers were straightway summoned
The culprit to denounce—The treacherous act
The Monarch swore most fearfully to punish,
Though 'twere his son who did it—I perceived
Thee trembling in the distance, and forthwith
Stepped out, and threw me at the Monarch's feet—
"I, it was who did it," I exclaimed;
On thine own son thy vengeance wreak!

MARQUIS.

Ah, Prince,
What recollections you recall!

CARLOS.

It was wreaked.
In presence of the servants of the court,
Who all stood round compassionate, 'twas wreaked
Upon thy Carl, fully as on a slave.
I looked at thee and wept not; though the pang
Made my teeth chatter loudly, yet I wept not—
My royal blood gushed mercilessly out
At every stroke disgracefully; I looked
At thee, and wept not—thou cam'st up, and threw'st
Thyself loud sobbing at my feet—"Yes, yes,"
Thou cried'st; "my pride is overcome—I will
Repay the debt, when thou art king."

MARQUIS—[holds out his hand to him.]

And I

Will do so, Carl.—The vow I made as boy
I now renew as man. I will repay.
E'en now, perhaps, the hour is come.

MARY STUART'S IMPRISONMENT RELAXED.

MARY STUART. Act III. Scene I.

(Our own version, as we are not aware of another.)

[A Park—The foreground occupied with trees—An extensive
prospect in the background—Mary runs forward in haste
from behind the trees—Hannah Kennedy, (her nurse),
follows at a distance.]

KENNEDY.

You hasten, e'en as though you were on wing!
I cannot follow!—O do wait for me!

MARY.

Let me enjoy my new freedom's pleasure!
I must be a child! O be thou one too!
I spurn the green turf without mode or measure!
Dip my wing'd step in the morning dew!
Am I in truth an enfranchised creature?
Are the black walls of my dungeon riven?
Leave me to drink in each thirsting feature,
Full and free, the sweet breeze of heaven!

KENNEDY.

O my dear lady! you are still imprison'd;
Only the prison bounds are not so narrow.
You only see not the surrounding walls
For the thick foliage of the trees that shroud them.

MARY.

Thanks, thanks again, to those dear friendly trees,
That veil my prison walls with verdant gleam;
Here will I dream of liberty and ease;
O why awake me from that happy dream?

Is not the broad expanse of heaven around?
My glance, delighted and unbound,
Roams forth into the far immensities:

There, where arise the misty mountains gray,
The frontiers stern of my dominion stand,
And those free clouds that southward sweep their way,
Are hasting to dear Gallia's distant strand.
Voyagers light of the joyous gale,
O on your pinions away to sail!
Greet with my blessing my childhood's land!
Stern captivity doom'd to rue,
Envoys none have I left but you;
Free through the air is your path serene;
Ye serve not the will of this moody queen.

KENNEDY.

Ah, my dear lady! you are rapt too far,
And long withholden freedom makes you rave!

MARY.

See where a fisher his shallow moors!
Scant is the pittance his labour gains!
Well would I guerdon his dearest pains,
Would he but waft me to friendly shores!
Gem and gold for his fee he should get,
A draught should he have he ne'er drew before;
Fortune and wealth he should find in his net,
Would he speed me but safe to some friendly shore.

KENNEDY.

O desperate hopes! what? see ye not that spies
Ev'n now at distance track our every step?
A dark and gloomy prohibition scares
Each pity-loving creature from our way.

MARY.

Nay, my good Hannah. 'Trust me, not for nought
My dungeon's door is open'd. This small grace
Is voucher of some greater bliss to come.
No—I mistake not! 'tis the active hand
Of ever-watchful love! I recognise
In all this scheme Lord Le'ster's mighty arm.
By soft degrees my bounds will be extended,
The less shall but familiarize the greater,
Until at length I gaze upon his presence
Who shall dissolve my bonds for evermore.

KENNEDY.

Alas! I cannot search this mystery.
But yesterday and you were doom'd to death,
And now to-day they grant this sudden freedom.
But I have heard it said, their chains are loos'd
For whom the everlasting freedom waits.

MARY.

Hear'st thou the hunter's horn resounding,
Mightily calling o'er wood and plain?
O on the spirited steed to be bounding,
Bounding along in the glad some train!
Hark to that well-known note again!
Sadly sweet its memories are:
Oft have I joy'd when I heard of yore,
Over the highland and over the moor,
Rushing in clamour, the chase afar.

JOANNA'S SOLILOQUY BEFORE PROCEEDING ON
HER MISSION.

MAID OF ORLEANS, Induction.

(Translation in Burns's Fireside Library.)

FAREWELL, ye hills and ye beloved pastures;
Ye still and sombre valleys, fare ye well!
Joanna shall no more frequent your haunts;
Joanna bids you now farewell for ever.
Ye plants which I have watered oft, ye trees
Which I have planted, burgeon blithesomely!
Farewell, ye grottoes, and ye cooling fountains;
Thou Echo, clear soft voice of this calm glen,
That oft gave answer to my maiden strain,
Joanna goes, and ne'er returns again!

Scenes of my early quiet joys, farewell!
I leave you all behind me now for aye!
Rove forth, my lambs, upon the turf-fell,
Destined henceforth all shepherdless to stray!
Far other duties call me hence away;
Far other flock 'tis now my lot to lead
On the red field of peril and dismay:
No idle earthly yearnings prompt the deed;
The Spirit bids me haste—He calls, and I must heed.

For He who erst on Horeb's hallowed side
To Moses blazed in fiery bush revealed,
And bade him face the Egyptian's ire and pride;
And called the pious David from the field,
For pastoral crook imperial glaive to wield;
He who was gracious aye to shepherds—He
To his high work my ministry hath sealed;
He called me from the branches of this tree,
And said, "Go forth on earth to testify for me:

In rugged arms thy graceful form enfold;
In griding steel thy tender breast attire:
No youth shall kindle in that bosom cold
Profane and idle flame of earth's desire.
Thy chainless locks shall feel no bridal tire;
No babe, reposing on thy bosom, trace
An infant image of a manly sire;
For thee have I of old decreed to grace
With martial power and fame above all female race.

And when in strife the boldest fall away,
When the last hour of France is hovering nigh,
Then shall thy hand my Oriflamme display,
And, swift as reaper shreds the harvest dry,
The haught oppressor shalt thou hurl from high,
Bid his proud star in mid ascendant cower,
Rescue thy land's heroic progeny,
And, 'neath fair Rheims' emancipated tower,
Set on the rightful brow the sovran crown of power."

A token Heaven hath shewn—I know it well!
He sends to me the casque! it comes from Him!
With might divine I feel my bosom swell!
The spirit of the flaming Cherubim
With force supernal nerves each feeble limb,
And, wild as tempest sweeps the midnight sky,
Forth urges to the iron conflict grim!
Hark! through me peals my country's battle-cry!
The trumpets' fierce acclaim! the mustering chivalry!

TELL'S SOLILOQUY BEFORE THE ASSASSINATION OF GESLER.

WILLIAM TELL, *Act IV. Scene III.*

(Translation in Burns's Fireside Library.)

[A hollow pass, near Küssnacht—The road leads down between the rocks; and, before they appear on the stage, travellers are seen on the heights. Rocks close in the scene on every side: on one in the foreground is a projecting point, covered with low trees.]

TELL—[with his crossbow.]

THROUGH this high gulley must he pass,
There is no other way to Küssnacht—Here
Will I commit the deed for which I came.
The place is suited to the act: the trees
Will shield me from the view, and there is space
Through which my messenger can seek its aim;
The narrow path will hinder followers.
Make up thy account with heaven, lord Governor!
Thou must go hence—thy last sands are run out.

Oh! I lived calm and harmless, and my prey
Was the wild deer that dwelt within our forests:
My thoughts were free from violence, until thou
Didst steal the gift of peace from out my heart,
And changed the milk of human thought and feeling
Into foul poison. To harsh thoughts, which ne'er
Till thou didst teach them me, my soul e'er knew,
Hast thou inured me. He who struck the aim
From the head of his own child, oh, shall he not
As surely strike to the life-blood of his foe?

My poor, my innocent children, my loved wife,
Must I protect 'gainst thee, lord Governor.
There, when I drew my bow, and my hand trembled,
And thou with devilish joy compelledst me
To aim at the head of my own child—when I,
All powerless, sunk before thee,—then I swore
A fearful oath—breathed to the ear of God,
And not of man—that my next arrow's aim
Should be thy heart. What in that hour I swore
Of deadly agony, I will perform;
God will require it at my hands—to Him
I breathed my oath.

Thou art, my lord, placed here in my emperor's stead.
Yet never had the emperor allowed
Such deeds as thou hast done. He sent thee here
To deal out justice to the land.—Severe
Perchance he knew thou wert, for 'twas in wrath
He sent thee; but he did not bid thee slake
Thy murderous thirst of blood on harmless men.
But there is One who shall avenge our cause.

O come then forth, thou messenger of pain!
My dearest treasure now, my highest good!
The heart that did resist all pious prayers
Shall not have power to resist thy point!
And thou, my trusty bow-string, in good stead
Thou oft hast served till now in joyful sports,—
Forsake me not in this most fearful earnest;
Hold firm for one aim more, and wing aright,
As thou so oft hast done, my pointed barb;
For if it play me false, I have no other
To fill its destined part.

[Travellers pass over the stage.]

Upon this stony bank will I sit down.
'Twas placed for the repose of travellers;
For here there is no dwelling; each one goes
With careless step, nor heeds the fellow-men
Who pass him by, nor thinks if they are well
Or ill, if joy or sorrow rest with them.
The careful merchant, pilgrims with few goods,
Few cares, the pious monk, the dark grim robber,
The merry player, and the carrier
Who comes from other lands with laden beasts,
From every region of the world do men
Pass by this road, to accomplish each his work:
Mine is a work of death!

[He sits down.]

Oh! once, my children, there was joy for you,
When from the chase your father late returned!
For never came he to his home but brought
Something for you—either a flower he'd plucked
From off the Alps, or some rare bird, or Ammon's horn
Such as the travellers find upon the hills.
Far other deadlier object now he seeks:
On the wild way he sits with vengeful thoughts—
It is his enemy's life for which he waits—
And yet e'en now his thoughts are but of you
His children. To guard you, and your gentle innocence
To shield against the tyrant's rage—he draws
His bow, such fearful murder to commit!

[He starts up.]

It is a noble prey for which I wait.
The hunter oft beneath the coldest skies
Will leap from crag to crag thro' the whole day,
And climb the rugged precipice, oft stained
By the drops of his own blood, and weary not,
So he can strike his prey; but here
I have a far more noble prize—the heart
Of my dread foe, who seeks to ruin us.

[Joyful music is heard—gradually approaches in the distance.]

From my first childhood have I been inured
To feats of archery; my bow has been
Constant companion of my life; to the goal
I oft have shot, and many a fair prize
Have I brought home from feasts where archers meet.
But the master-shot of all to-day I seek,
And carry the best prize that's to be won
Throughout the whole wide circle of the Alps.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. IV.

OUT of consideration for the excitable disposition of Mad Bess we took our way along the least bustling streets we could select; directing our course towards the outskirts of the town, behind which extended for some miles a portion of the range of hills known as the South Downs, over the smooth green turf of which we promised ourselves a canter. As we rode along, Coleman questioned me as to what had passed while he was seeing Punch saddled, to make me so determined to ride the chestnut mare, whose vicious disposition was, he informed me, so well known, that not only would no one ride her who could help it, but that Snaffles, who was most anxious to get rid of her, had not as yet been able to find a purchaser. In reply to this I gave him a short account of what had occurred, adding my more than suspicion that the whole matter had been arranged by Cumberland, in which notion he entirely agreed with me. "I was afraid of something of this sort, when I said I was sorry you had made that remark about cheating to him this morning—you see, he would no doubt suppose you had heard the particulars of his gambling affair, and that you meant to insult him by what you said, and he has done this out of revenge. Oh, how I wish we were safely at home again; shall we turn back now?" "Not for the world," said I—"you will find, when you know me better, that when once I have undertaken a thing I will go through with it—difficulties only make me more determined." "Ah!" said Coleman, "that is the kind of disposition they always give to the heroes of novels, the sort of character that will go and run his head against a brick wall to prove that it is the harder and thicker of the two—they knock out their brains though, sometimes, in doing it, when they happen to have any—it is very pretty to read about, splendid in theory, but I much doubt its acting so well if you come to put it in practice." "You may laugh at me, if you please," replied I; "but, depend upon it, a man of energy and determination will undertake great deeds, aye, and perform them too, which your prudent, cautious character would have considered impossibilities." "Perhaps it may be so," was the reply; "I know I am not the sort of stuff they cut heroes out of—woa, Punch! steady, old boy! holloa, what ails him? this is getting serious." During this conversation, we had been gradually leaving the town behind us, and approaching the Downs, and had arrived at a point where the road became a mere cart-track, and the open country lay spread for miles before us. Our two steeds had, up to the present time, conducted themselves with the greatest propriety; but they now began to show signs of excitement, and, as the fresh air from the downs blew against their nostrils, they tossed their heads, snorted, and exchanged the quiet jog-trot pace at which we had been proceeding, for a dancing, sidelong motion, which somewhat disturbed Coleman's equanimity, and elicited from him the expressions above recorded. The road now became so uneven and full of ruts, that we agreed to turn our horses' heads, and quit it for the more tempting path-way afforded by the green-sward. No sooner, however, did Punch feel the change from the hard road to the soft elastic footing of the turf, than he proceeded to demonstrate his happiness by slightly elevating his heels, and popping his head down between his fore-legs, thereby jerking the rein loose in Coleman's hand; and, perceiving that his rider (who was fully employed in grasping the pommel of the saddle in order to preserve his seat) made no effort to check his vivacity, he indulged his high spirits still further by setting off at a brisk canter. "Pull him in," cried I, "you'll have him run away with you; pull at him."

Whether my advice was acted upon or not I was un-

able to observe, as my whole attention was demanded by "Mad Bess," who appeared at length resolved to justify the propriety of her appellation. Holding her in by means of the snaffle alone had been quite as much as I had been able to accomplish during the last ten minutes, and this escapade on the part of Punch brought the matter to a crisis. I must either allow her to follow him, i.e. to run away, or use the curb to prevent it. Seating myself, therefore, as firmly as I could, and gripping the saddle tightly with my knees, I took up the curb rein, which till now had been hanging loosely on the mare's neck, and gradually tightened it. This did not, for a moment, seem to produce any effect, but as soon as I drew the rein sufficiently tight to check her speed, she stopped short, and shook her head violently. I attempted gently to urge her on,—not a step except backwards would she stir,—at length in despair I touched her slightly with the spur, and then "the fiend within her woke," and proceeded to make up for lost time with a vengeance. The moment the mare felt the spur, she reared until she stood perfectly erect, and fought the air with her fore-legs. Upon this I slackened the rein, and striking her over the ears with my riding-whip, brought her down again;—no sooner, however, had her fore-feet touched the ground than she gave two or three violent plunges, which nearly succeeded in unseating me, jerked down her head so suddenly as to loosen the reins from my grasp, kicked viciously several times, and seizing the check of the bit between her teeth so as to render it utterly useless, (evidently an old trick of hers,) sprang forward at a wild gallop. The pace at which we were going soon brought us alongside of Punch, who, having by this time mastered his rider, considered it highly improper that any steed should imagine itself able to pass him, and therefore proceeded to emulate the pace of Mad Bess. Thereupon a short but very spirited race ensued, the cob's pluck enabling him to keep neck and neck for a few yards; but the mare was going at racing speed, and the length of her stride soon began to tell; Punch, too, showed signs of having nearly had enough of it. I therefore shouted to Coleman, as we were leaving them, "Keep his head up hill, and you'll be able to pull him in directly." His answer was inaudible, but when I turned my head two or three minutes afterwards I was glad to see that he had followed my advice with complete success—Punch was standing still, about half a mile off, while his rider was apparently watching my course with looks of horror.

All anxiety on his account being thus at an end, I proceeded to take as calm a view of my own situation as circumstances would allow, in order to decide on the best means of extricating myself therefrom. We had reached the top of the first range of hills I have described, and were now tearing at a fearful rate down the descent on the opposite side. It was clear that the mare could not keep up the pace at which she was going for any length of time: still she was in first-rate racing condition, not an ounce of superfluous flesh about her, and though she must have gone more than two miles already, she appeared as fresh as when we started. I therefore cast my eyes around in search of some obstacle which might check her speed. The slope down which we were proceeding extended for about a mile before us, after which the ground again began to rise. In the valley between the two hills was a small piece of cultivated land, enclosed (as is usual in the district I am describing) within a low wall, built of flint-stones from the beach. Towards this I determined to guide the mare as well as I was able, in the hope that she would refuse the leap, in which case I imagined I might pull her in. The pace at which we were going soon brought us near the spot, when I was glad to perceive that the wall was a more formidable obstacle than I had at first imagined, being fully six feet high, with a ditch in front of it. I therefore selected a place where the ditch seemed widest, got her head well up by sawing her mouth with the snaffle, and put her fairly at it.

No sooner did she perceive the obstacles before her, than, slightly moderating her pace, she appeared to collect herself, gathered her legs well under her, and rushing forward, cleared wall, ditch, and at least seven feet of ground beyond, with a leap like a deer, alighting safely with me on her back on the opposite side, where she continued her course with unabated vigour.

We had crossed the field (a wheat stubble) ere I had recovered from my astonishment at finding myself safe after such a leap as I had most assuredly never dreamt of taking. Fortunately there was a low gate on the farther side, towards which I guided the mare, for though I could not check, I was in some measure able to direct her course. This time, however, she either did not see the impediment in her way, or despised it, as, without abating her speed, she literally rushed through the gate, snapping into shivers with her chest the upper bar, which was luckily rotten, and clearing the lower ones in her stride. The blow, and the splintered wood flying about her ears, appeared to frighten her afresh, and she tore up the opposite ascent, which was longer and steeper than the last, like a mad creature. I was glad to perceive, however, that the pace at which she had come, and the distance (which must have been several miles), were beginning to tell—her glossy coat was stained with sweat and dust, while her breath drawn with short and laboured sobs, her heaving flanks, and the tremulous motion of her limbs, afforded convincing proofs that the struggle could not be protracted much longer. Still she continued to hold the bit between her teeth as firmly as though it were in a vice, rendering any attempt to pull her in utterly futile. We had now reached the crest of the hill, when I was not best pleased to perceive that the descent on the other side was much more precipitous than any I had yet met with. I endeavoured, therefore, to pull her head round, thinking it would be best to try and retrace our steps, but I soon found that it was useless to attempt it. The mare had now become wholly unmanageable; I could not guide her in the slightest degree; and, though she was evidently getting more and more exhausted, she still continued to gallop madly forwards, as though some demon had taken possession of her, and was urging her on to our common destruction. As we proceeded down the hill our speed increased from the force of gravitation, till we actually seemed to fly—the wind appeared to shriek as it rushed past my ears, while, from the rapidity with which we were moving, the ground seemed to glide from under us, till my head reeled so giddily that I was afraid I should fall from the saddle. We had proceeded about half way down the descent, when on passing one or two stunted bushes which had concealed the ground beyond, I saw, oh horror of horrors, what appeared to be the mouth of an old chalk-pit, stretching dark and unfathomable, right across our path, about 300 yards before us. The mare perceives it when too late, attempts to stop, but from the impetus with which she is going, is unable to do so. Another moment, and we shall be over the side! With the energy of despair I lifted her with the rein with both hands, and drove the spurs madly into her flanks;—she rose to the leap, there was a bound! a sensation of flying through the air! a crash! and I found myself stretched on my back in safety on the turf beyond, and Mad Bess lying, panting, but uninjured, beside me.

To spring upon my feet, and seize the bridle of the mare, who had also by this time recovered her footing, was the work of a moment. I then proceeded to look around, in order to gain a more clear idea of the situation in which I was placed, in the hope of discovering the easiest method of extricating myself from it. Close behind me lay the chalk-pit, and, as I gazed down its rugged sides, overgrown with brambles and rank weeds, I shuddered to think of the probable fate from which I had been so almost miraculously preserved, and turned away with a heartfelt expression of thanksgiving to Him, who had mercifully decreed that the thread of my

young life should not be snapped in so sudden and fearful a manner. Straight before me, the descent became almost suddenly precipitous, but a little to the right I perceived a sort of sheep-track, winding downwards round the side of the hill. It was a self-evident fact that this must lead somewhere, and as all places were alike to me, so that they contained any human beings who were able and willing to direct me towards Helmstone, I determined to follow it. After walking about half a mile, Mad Bess (with her ears drooping, and her nose nearly touching the ground) following me as quietly as a dog, I was rejoiced by the sight of curling smoke, and on turning a corner, I came suddenly upon a little village green, around which some half dozen cottages were scattered at irregular distances. I directed my steps towards one of these, before which a crazy sign, rendered by age and exposure to the weather as delightfully vague and unintelligible as though it had come fresh from the brush of Turner himself, hung picturesquely from the branch of an old oak.

The sound of horses' feet attracted the attention of an elderly man, who appeared to combine in his single person the offices of ostler, waiter, and boots, and who, as soon as he became aware of my necessities, proceeded to fulfil the duties of these various situations with the greatest alacrity. First he rubbed down Mad Bess, and administered some refreshment to her in the shape of hay and water, then he brought me a glass of ale, declaring it would do me good, (in which by the way he was right, for so it did). He then brushed certain stains, which I had contracted in my fall, from my coat, and finally told me my way to Helmstone, seeming to consider himself over paid by the shilling with which I rewarded his various attentions. I now remounted Mad Bess, who, though much refreshed by the hay and water, still continued perfectly quiet and tractable, and setting off at a moderate trot, reached the town, after a ride of about eight miles, without any farther adventure, in rather less than an hour. As I entered the street in which Snaffles' stables were situated, I perceived Coleman and Lawless standing at the entrance of the yard, evidently awaiting my arrival. When I got near them, Coleman sprang eagerly forward to meet me, saying, "How jolly glad I am to see you safe again, old fellow! I was so frightened about you; how did you manage to stop her?" "Why, Fairfeigh, I had no idea you were such a rider," exclaimed Lawless; "I made up my mind you would break your neck, and old Sam be minus a pupil, when I heard you were gone out on that mare. You have taken the devil out of her somehow, and no mistake; she's as quiet as a lamb," added he, patting her. "You were very near being right," replied I; "she did her best to break my neck, and her own too, I can assure you." I then proceeded to relate my adventures, to which both Lawless and Coleman listened with great attention; the former interrupting me every now and then with various expressions of commendation, and when I had ended he shook me warmly by the hand, saying,—"I give you great credit; you behaved in a very plucky manner all through; I didn't think you had it in you; 'pon my word, I didn't. I shall just tell Cumberland and Snaffles a bit of my mind, too. Here Snaffles, you old humbug, where are you?" "Oh don't mind him," said I, "it's never worth while being angry with people of that sort; besides, Cumberland made him do it." "That does not signify; he knew the danger to which he was exposing you, perhaps better than Cumberland did. He had no business to do it, and I'll make him beg your pardon before we leave this yard. Here, you ostler fellow, where's your master?" shouted Lawless, as he turned into the yard, where I soon heard the loud tones of his voice engaged in angry colloquy with Snaffles, whose replies were inaudible. In a short time, the latter approached the spot where I was standing, and began a very long and humble apology, saying that he should never have thought of giving me the mare if he had not seen at a glance that I was

a first-rate rider, and much more to the same purpose, when Lawless interrupted him with, "There, cut it short; Mr. Fairleigh does not want any more of your blarney; and mind, if anything of the sort occurs again, I shall hire my horses somewhere else, and take care to let all my friends know why I do so. Now let's be off, it's getting near dinner time." So saying, he turned to leave the yard, a movement which, as soon as I had found my friend James, returned his spurs, and taken him the promised half-crown, I proceeded to imitate, and thus ended the episode of Mad Bess.

On reaching home, the door was opened by Thomas, who accosted us with, "Here's such a bit of fun, gentlemen! The new pupil's arrived, and ain't he a rum'un, jest? Oh, I never!" "Why, how do you mean? what's he like then?" asked Lawless. "Oh, he's very well to look at, only he's as tall as a life-guardsmen; but he's such a free and easy chap, and ain't he got a pretty good notion of making himself comfortable too, that's all—but come in, Gents, you'll soon see what I mean. He chucked the flyman who brought him here half-a-guinea, and when I asked him if he did not want the change, for the fare was only half-a-crown, he merely said, 'Pooh!' and told me not to talk, for it tired him." With our feelings of curiosity somewhat excited by this account, we hastened into the Pupils' room, anxious to behold the individual who had so greatly astonished Thomas.

Seated in Dr. Mildman's arm-chair, and with his legs resting upon two other chairs so arranged as to form a temporary sofa, was a young man apparently about eighteen, though his length of limb, and the almost herculean proportions of his chest and shoulders, seemed rather to belong to a more advanced age. He raised his head as we entered, disclosing a set of features which, but for an expression of languor and heaviness by which they were characterised, must have been pronounced unusually handsome. His complexion was a rich nut-brown, excepting over the high forehead, which was white as snow, contrasting well with the dark hue of his hair, the short clustering curls of which, harmonizing well with the classical outline of his head, reminded one involuntarily of the young Antinous. The small finely-formed mouth, and well chiselled nostril, told a tale of pride and resolution, strangely at variance with the mild sleepy appearance of the large dark hazel eyes, to which the long silky lashes that shaded them imparted an almost feminine expression. He did not attempt to alter his position as we approached, but, merely turning his head, gazed at us steadfastly for a moment, and then observed in a slow, half-absent manner, "Oh, the other pupils I suppose—how do you do, all of you?" Lawless, who was foremost, was so much surprised and so little pleased at this nonchalant style of address that he made no reply, but turning on his heel, proceeded to leave the room, in order to divest himself of his hunting costume, muttering as he went, "Cool enough that!" The duty of doing the polite having thus devolved upon Coleman, he winked at me by way of preliminary, and, making a low bow in the true dancing master style, replied as follows:—"Your penetration has not erred, sir; we *are* the other pupils; and in answer to your obliging inquiries I have much pleasure in informing you that we are all in perfect health; and now, sir, in return for your kind condescension, allow me, in the absence of my superiors, to express a hope that *you* are feeling tolerably comfortable,—ahem!" Having thus delivered himself, Coleman drew up his figure to its utmost height, and folding his arms with an air of pompous dignity, awaited an answer. "Oh, yes, I'm comfortable enough," was the reply; "I always am; only I'm so done up, tired as a dog,—the least thing fatigues me; I'm as weak as a rat; don't they give you sofas here, Mr. What's-your-name?" "My name is Norval—I mean, Coleman; my father divides his time between feeding his flocks on the Grampian Hills, and fleecing his clients in Russell-square; though I must confess, that ever since I can

remember, he has dropped the shepherd, and stuck to the solicitor, finding it pays best, I suppose. Regarding the sofa, we have not one at present, but Dr. Mildman went to town this morning, I did not till this moment know why,—but now I see it all,—he was doubtless aware you would arrive to-day, and finding he could not get a sufficiently comfortable sofa for you in Helmstone, he is gone to London to procure one; there is still time to write by the post, if there is any particular way in which you would like to have the stuffing arranged." This speech made Oaklands raise his head, and look Coleman so fixedly in the face, with such a clear, earnest, penetrating gaze, that it appeared as if he would read his very soul.

Having apparently satisfied himself, he smiled slightly, resumed his former attitude, and observed in the same half sleepy tone, "No, I'll leave all that to him; I am not particular; what time do you dine here?" I replied, (for the look I have described seemed to have the wonderful effect of silencing Coleman,) "at five o'clock." "Very good; and I believe there's a Mrs. Mildman, or some such thing, is there not? I suppose one must dress,—will you be so kind as to tell the servant to bring some hot water, and to look out my things for me at a quarter before five!—I hate to have to hurry, it tires me so." Having said this, he took up a book which was lying by his side, and murmuring something about "talking being so fatiguing," soon became buried in its contents.

Whilst I was dressing for dinner, Lawless came into my room, and told me that he had been speaking to Cumberland with regard to the way in which he had behaved to me about the mare, and that Cumberland professed himself exceedingly sorry that the affair had so nearly turned out a serious one, declaring he meant it quite as a joke, never expecting that when I saw the mare I should venture to mount her—"So you see," continued Lawless, "he merely wanted to have a good laugh at you, nothing more; it was a thoughtless thing to do, but not so bad as you fancied it, by any means." "Well" replied I, "as he says so, I am bound to believe him, but his manner certainly gave me the impression that he meant me to ride her. He went the right way to make me do so, at all events, by hinting that I was afraid." "Ah! he could not know that by intuition, you see," said Lawless; "he thought, I dare say, as I did, that you were a mere molly-coddle, brought up at your mother's apron-string, and had not pluck enough in you to do any thing sporting." "It's not worth saying any thing more about," replied I; "it will never happen again: I am very much obliged to you, though." "Oh! that's nothing," said Lawless; "if Cumberland had really meant to break your neck, I should have fallen out with him; that would have been too much of a good thing: however as it is, it's all right"—and so the conversation ended, though I felt far from satisfied in my own mind as to the innocence of Cumberland's intentions.

On reaching the drawing-room I found the whole party assembled, with the exception of Mr. Henry Oaklands, who had not yet made his appearance. At the moment of my entrance, Mrs. Mildman, who had not seen the new arrival, and who, like the rest of her sex, was somewhat curious, was examining Coleman, (who stood bolt upright before her with his hands behind him, looking like a boy saying his lesson,) as to his manners and appearance—"Very tall, and dark hair, and large eyes," continued Mrs. Mildman; "why he must be very handsome." "He seems as if he were half asleep," observed I. "Not always," said Coleman; "did you see the look he gave me? I thought he was going to eat me." "Dear me! why he must be quite a cannibal; besides, I don't think you would be at all nice to eat, Mr. Coleman," cried Mrs. Mildman, with a smile. "Horrid nasty, I'm sure," muttered Mullins, who was seated on the very edge of his chair, and looking thoroughly uncomfortable, as was his wont in any thing like civilized society. At this moment the door opened,

and Oaklands entered. If one had doubted about his height before, when lying on the three chairs, the question was set at rest the instant he was seen standing; he must have measured at least six feet two inches, though the extreme breadth of his chest and shoulders, and the graceful setting-on of his finely-formed head, together with the perfect symmetry and proportion of his limbs, prevented his appearing too tall. He went through the ceremony of introduction with the greatest ease and self-possession; and though he infused rather more courtesy into his manner towards Mrs. Mildman than he had taken the trouble to bestow on us, his behaviour was still characterised by the same indolence and listlessness I had previously noticed, and which indeed seemed part and parcel of himself. Having bowed slightly to Cumberland and Lawless, he seated himself very leisurely on the sofa by Mrs. Mildman's side, altering one of the pillows so as to make himself thoroughly comfortable, as he did so. Having settled it to his satisfaction, he addressed Mrs. Mildman with, "What a very fatiguing day this has been, haven't you found it so?" "No, I can't say I have," was the reply; "I dare say it was warm travelling: I'm afraid in that case, Dr. Mildman will not have a very pleasant journey,—he's gone to Town to-day." "Ah! so that short, stout young gentleman, (the first two adjectives he pronounced very slowly and distinctly) told me." "Mr. Coleman," insinuated Mrs. Mildman. "Pleasant, that," whispered Coleman to me. "Take care," replied I, "he'll hear you." "I'm afraid," continued Oaklands, "the old gentleman will be quite knocked up—I wonder he does not make two days' journey of it." "Dr. Mildman is not so very old," observed Mrs. Mildman, in rather an annoyed tone of voice. "I really beg pardon, I scarcely know why I said it," replied Oaklands, "only I somehow fancied all tutors were between sixty and seventy: very absurd of me. My father sent all kind of civil messages to the o — — to Dr. Mildman, only it is so much trouble to remember that sort of thing." At this point the conversation was interrupted by the announcement of dinner. Oaklands, (from whom I could not withdraw my eyes, so unlike anything I had ever met with before was he,) was evidently preparing to hand Mrs. Mildman down to dinner, as soon as he could summon sufficient energy to move, but perceiving Cumberland approach her for that purpose, he appeared to recollect himself, smiled slightly, as if at what he had been about to do, and taking me by the arm, said, "Come, Master Curlylocks, you shall be my lady, and a very pretty girl you would make too, if you were properly be-muslined;" adding as we went down stairs together, "You and I shall be great friends I'm sure; I like your face particularly—what a lot of stairs there are in this house! they'll tire me to death."

NATURAL HISTORY OF BIRDS.

No. II.

BIRDS OF PREY.—VULTURES AND EAGLES.

ALL writers agree in placing the birds of prey first in their systems. We therefore commence our series with an account of this order. Linnæus distinguished all such birds by the term *accipitres*, the plural of the Latin *accipiter*, signifying a hawk, or more properly, a bird which preys upon others of its kind. Some, however, apply the word *rapaces*, others, *raptores* to the order, and as each epithet denotes a bird of prey, the use of either is admissible.

The characteristics of this order are striking. Dwelling, for the most part, remote from human habitations, haunting sea-beaten rocks, frequenting wild mountain summits, or dwelling in lonely forests, their singular habits excite the curiosity of man. The love of solitude is a characteristic of all true birds of prey. Where the avalanche thunders as it crashes through the mountain

forest, you may find them; in the silence of the Apennines or the Andes they hold their homes, but retire before the sound of the woodman's axe, and love not the peopled villages or smiling fields. Everything connected with the race partakes of the stern and great, for power, not beauty, is its characteristic.

THE CONDOR.

The order is divided into four families:—

- The *vulturidae*, or vultures;
- The *falconidae*, or eagles and hawks;
- The *strigidae*, or owls;
- The *laniidae*, or butcher birds.

Each division has a marked peculiarity, and each a distinct use in the operations of nature.

The vulture family.—Let us enter a zoological garden, and take our stand near a group of vultures. We shall probably see little to admire in the appearance of these birds; if the spectator be a lady, she will doubtless dislike the collection. Others may pronounce, with Goldsmith, the vulture an unclean, cruel, and indolent brute, feeding on carrion, and only deserving contempt. But let such persons take a journey to Egypt; there they will find this unsightly bird protected by laws: heavy penalties await its assailant, whilst the natives rejoice to find a pair hovering near their village.

Why is this? If the question were proposed to some, they might answer by ascribing this regard to a stupid superstition respecting the vulture.

But the vulture would be prized by the most delicate ladies were they compelled to live in torrid regions, or in the filthy cities of the East. In England we pay scavengers to cleanse our towns, and the police indict the man who encumbers the footpath with putrid matter. The vulture saves all this trouble; he, considerate bird, stoops from his aerial height to become the purifier of cities. He is more effective than a whole college of physicians, and a board of health; for the putrid substances which would quickly taint the air are borne off by the vulture.

The chief use of this family of birds is to keep the air free from pestilential taint, and truly the office is an important one. There is something remarkably striking in this arrangement. Let us consider the facts. Substances accumulate in crowded cities, which send forth in a short time a pestiferous effluvia. Great labour and care would be required to bury such putrefying matter deep in the earth. It could scarcely be done on a large scale. But here comes in the provision of nature. A bird frequents those regions, exactly fitted by taste and organization to live upon the very materials which would generate the means of destruction to man.

kind. This is the vulture. So completely is the system and taste of the bird adapted to the end of its creation, that carrion is preferred to fresh meat.

In warm climates the vultures may be observed through the day, soaring high in air, and circling over a city on the watch; the instant any offal or carrion is thrown into the street, they descend in crowds and remove the nuisance. In some parts of America, vast quantities of large animals are killed for their hides only; the hunters, having skinned the beast, leave the body; in every case the observant vultures descend, and quickly leave nothing of the largest buffalo, save the bones, thus removing so prolific a source of pestilence.

As vultures often fly at great elevations, where the human eye cannot perceive them, it is evident that strong powers of vision belong to them; for no prey, however small, escapes their observation. The traveller journeying through the desert has often to leave behind him a dead horse, or camel; in a short time he may see far up in the sky a number of small black spots; whilst he is speculating on the cause of this appearance, the objects grow larger, and have a circling motion; nearer and nearer they approach, till at length a troop of vultures is clearly discerned. They must have seen the animal fall, and immediately descended from their invisible heights. Some naturalists have erroneously ascribed this keen detection of distant food to great powers of smell; but it is clear that the birds would not fly at such immense heights for the sake of smelling; this would rather lead them to sail near the ground. Besides, effluvia cannot be supposed to extend to such distances, as it must become diffused through the atmosphere, and so destroyed.

Experiments, also, have been made, which clearly prove that sight, not smell, brings the vulture from his lofty track.

Dried skins, from which no effluvia could rise, have been stuffed with straw to represent the figure of some dead animal. These stuffed resemblances being left on the ground, in a short time the vultures were seen descending with rapid sweeps toward the objects. Nor did they discover the deception till alighting, when, attempting to drive their beaks into the impenetrable substance, they evinced every symptom of surprise at the unusual occurrence.

The vultures differ from most birds of prey in evincing a tendency to fix themselves near the dwellings of men: this arises from the facilities which these localities afford for procuring food.

The geographical range of these birds is remarkably wide, extending from India to the coasts of Britain, abounding in America, and reaching from Africa on the south, to Norway on the north. But their principal home is in warm regions, where their peculiar habits of feeding are most usefully exercised.

We cannot reckon vultures amongst our British birds: though Mr. Garrell has ventured upon such a classification, from the fact that one was taken in Somersetshire, in 1825, whilst feeding on the carcase of a sheep. Such an isolated fact no more entitles us to rank the vulture amongst British birds, than to call a Spaniard an Englishman, because we may happen to meet with him in a Buckinghamshire village. The different species of vultures need not be described. Some are classed according to colour, as the golden and the brown; others according to the region inhabited, as the Egyptian vulture. The appearance of the whole family clearly distinguishes them from the eagles. The head and neck are without feathers, which gives them an unsightly appearance; the eyes project, whilst those of the eagle are deeply set in the head; the claws are shorter and less hooked than in the eagle, which birds they also exceed in size. The vulture's beak is more straight, and does not bend till near the point, whilst the eagle's curves more throughout.

One of the largest birds we are acquainted with, the condor, properly belongs to the vulture family. These

giant birds are generally found in the lonely peaks and valleys of the Andes, though at certain seasons they descend towards the coast, frequenting the wild shores of sea-beaten cliffs. Some are said to measure eighteen feet from wing to wing; the largest specimen which we have seen measures but ten feet; this, however, might not have been full grown. The appearance of this majestic bird, as he sails above the snow-capped mountains, is sublime; with a single sweep of those mighty wings, he soars away into the distant heavens, where the keenest sight is unable to follow his track. Sometimes the deep silence of a valley is broken by the roar of his flight, as, rising from an abutting rock, he sails through the long ravine, startling with his shadow the cowering birds. The strength of the condor enables it to carry off the largest animals, but unless pressed by hunger they rarely attack living creatures.

Second Family, The Falconidae.—This division includes both eagles and hawks, the characteristics of each being implied by the term *falco*, which has been given to the whole family, from the hooked form of the beak and claws.

The eagles first claim our attention.

Many persons talk of birds of prey, as if their existence was somewhat a defect, a cause of confusion and strife, in creation. They admire the dove, listen with interest to the history of the swallow, and rejoice in the rich melody of singing birds; but, say they, how different from these innocent, peaceful and beautiful creatures, is the fierce eagle or marauding hawk. We do not wish to present any portion of the living universe in an unlovely aspect; every part has its allotted object and a beauty of its own; and it should be our aim to discern this truth, in every link of the great chain of being. Disparage not the bird of prey, he has received his instincts from the Infinite Intelligence; these instincts form his commission to keep within certain limits the inhabitants of the air. Is he more fierce than the pet swallow, or the pretty goldfinch? How does this said swallow live? By destroying some hundreds of beautifully-formed insects every day, each of which may as justly claim our pity as the sparrow which affords a meal to the hawk. If we judge fairly, we shall see reason to pronounce some of our beautiful little birds more cruel than the eagle; he, perhaps, destroys two or three birds every day, but dozens of wonderfully-constructed insects will scarcely suffice for a swift's breakfast. All birds are in one sense birds of prey; they all destroy life; and the falconidae are, therefore, only in the same general predicament with the whole feathered creation—even with man himself, whose daily food attests his destruction of life. Away then with false sentiment! it is the great law that all mundane must end; birds too must die; and sudden death by the stroke of an eagle's talon is mercy compared with "dying daily, inch by inch, from slow decay;" there is decidedly less of pain in the former case. This order of birds existed in those remote geological eras, the wonderful histories of which have astonished our age. Thus, through all ages of life, the living world has been so constructed, that the death of one animal by another should form an essential part of the great system. These considerations should lead us to regard with closer attention the habits of this family. The proud motions, and commanding air of the eagle, induced various nations to adopt its figure on their banners, as the symbol of power and dominion. It was borne as a standard by the Assyrians, Persians, and Romans in ancient times, whilst several modern empires retain it in their insignia.

The food of the eagle is the very opposite to that chosen by the vulture. The former, unless pressed by hunger, will not eat carrion, preferring in general to kill its own prey. Eagles, therefore, do not flock round the dead bodies of animals; hence the text in St. Matthew, "wherever the carcase is, there will the eagles be gathered together," is supposed to refer to an eastern species of vulture which is similar in appearance to the eagle. Eagles appear to kill their prey with the talons rather than the beak, for

when a dog was thrown into a cage where one was kept, the bird sprang on the dog's back, and gripping the neck, with one foot prevented the prey from turning to bite; it then began to tear and pierce the dog with the talons of the other foot till it died. The beak was then brought into use for devouring the body. Some eagles feed upon fish, which they snatch with daring address from the surface of the sea. The osprey is often seen hovering high above the waves; all at once we see him sweep down with an arrow's velocity, and plunge into the waters, whence he rises, bearing in his talons a large fish, with which he swoops away to some distant rock. The ospreys are often met with on the southern coast of England, and the antiquary sometimes lights upon a nest, in some ruined town of other days.

Some eagles which feed upon fish are not fitted for plunging into the water; these are constantly on the look out to rob the osprey of its prey as it rises from the sea. The white-headed eagle will sit for hours, watching the osprey fishing: the moment the latter has seized a fish, off darts the former in pursuit; the chase is often desperate, for the osprey does not readily abandon its booty, but, sweeping in large circles, endeavours to keep above the eagle, which being unencumbered, soon gets the advantage, upon which the osprey drops the fish. Now comes the feat of the white-headed eagle: descending with lightning speed, he grasps the fish before it can reach the water, and bears off the spoil with a scream of triumph. One species of eagle feeds chiefly on snakes, which it kills by repeated blows of its powerful wings: its food is not, however, confined to such animals, as in the stomach of one were found about twenty young turtles, in addition to many lizards and snakes.

Strange stories respecting the eagle's wonderful power of sight have been told; but, though many of these are doubtless exaggerations, there is no doubt that this bird possesses an acuteness of vision similar to that of the vulture. Our remarks on the sight of the latter will, therefore, apply to the eye of the eagle.

Of the various species, the golden eagle is the most noted and powerful; it is named from the coppery-yellow colour of the plumage, which is sometimes mingled with tints of brown. The appearance of this noble bird, when flying, is majestic: the hunter watches it soaring above the Alpine forest with a feeling approaching to awe, as he thinks of the wild tales which represent the mighty bird as the body of a fallen angel, who still seeks, in that winged shape, those regions of its former home. Solemn is the spectacle, when the setting sun flings his ruddy gleam on the grey walls of some ancient mountain tower, which stands as the solitary representative of a thousand departed ages; but how is the solemnity deepened, when, on the highest tower, we mark the golden eagle, calmly gazing with his eyes of fiery splendour on the departing sun! The golden eagle is sometimes met with in England, and more frequently in Scotland, where they build a platform nest in the sheltering recesses of the rocks.

The length of this bird, from beak to tail, is about 3½ feet; and the breadth, across the outspread wings, 8 feet. Its eggs are 3½ inches in length, and 2½ wide, of a dirty white colour, and speckled with reddish brown spots. The golden eagle is noted for its great longevity, some having been known to exist for more than a hundred years; indeed, every kind of eagle possesses great length of life. When they reach a great age in a state of captivity, few of their natural characteristics remain: instead of the bold and daring bird which glanced defiance on his foe, and claimed the sovereignty of many a league of air, we see a feeble and discredited bird, bearing the faded symbols of former kingly state.

In their natural state of wild freedom, few become thus enfeebled by age; their life of strife, tempestuous seasons, or the hunter's rifle, secures the means of terminating existence, before weakness unfits the king of birds to pursue, as of old, his prey.

There are several varieties of the eagle family, as the

golden eagle, bald eagle, white eagle, white-tailed eagle, osprey, and others; but each species possesses, in common, most of the qualities already noticed.

Hawks.—Some birds may be called lesser eagles, so much do their habits resemble those of the larger falcons, with which they are already classed under the family name, *falconidae*. Hawks have one peculiarity in their history widely distinguishing them from eagles; the latter have rarely been trained to become the willing servants of man, but the hawk has been the prized companion of kings and nobles; statesmen have stooped to superintend its education; and scholars and emperors have combined to write on its qualities.

Let us take a moment's glance into "England in the olden time;" behold a gallant and noble train issuing from a castellated baronial mansion; prancing steeds carry brave knights, and ladies fair; bright as the sun above them is each countenance, for the sport of kings is afoot; it is "a hawking party:" there sit on the hand of their noble owners the long-winged hawks,¹ quietly waiting till the game is flushed; see, the herons² are in view returning from their feeding grounds: off goes the falcon at the word of command, upwards with a perpendicular flight, the heron wings his way, as if to seek a refuge in the heavens: the falcon sweeps after him, whilst every heart in the crowd beats with wild excitement. At length the heron and falcon are seen descending together locked in a furious contest; the battle is quickly over, and the victorious hawk returns to his exulting master. So necessary was this amusement deemed by our ancestors, that King Edward III. took his collection of hawks and thirty mounted falconers with him into France, when he invaded that country. The excitement of the stag and fox-hunt have long superseded hawking in England; the falcon is no longer the companion of princes, though royalty still keeps its grand falconer in memory of the ancient sport. The hawk is yet found in our island, though an un-honoured bird; but the persecutions of game-keepers and farmers have driven the noblest species from the more cultivated parts of England.

The principal of the long-winged hawks was the *gyr* falcon, which approached some of the eagles in size and strength. This is extremely rare in England.

The *peregrine* falcon was formerly in high esteem, and employed to attack the heron and other large birds. It has a wider geographical range than the other falcons, and from this circumstance received the name *peregrine* (a wanderer). It is not uncommon in the North of Scotland, where, however, he must hunt on his own account; neither princes nor peasants assembling to applaud his daring. This bird is about eighteen inches long. The *hobby* may be termed a small peregrine falcon, and was used to fly at snipes and larks, the latter especially affording very exciting sport by its rapid evolutions and power of wing.

The *merlin* is the smallest of the long-winged hawks, but his desperate courage secures the destruction of large birds. The merlin sometimes visits the South of England in the winter season; this, however, is not a frequent event.

The *kestrel* or *windover* may often be seen balancing itself in the breeze with almost motionless wing, watching for prey; from this steady motion in the air, it has received its name of *windover*.

The *goshawk* is reckoned the best of the short-winged falcons; it does not stoop upon its prey from above, but follows it with a rapidity which secures the death of the pursued. This kind is also rare in the South of England.

The *sparrow-hawk* may be called a small goshawk;

(1) Hawks are divided into two classes, *long-winged*, as the *gyr* falcon, the peregrine falcon, Lanner and Merlin; and *short-winged*, as the Goshawk, and *sparrow* hawk. The first class were most esteemed.

(2) This bird was formerly preserved for hawking at, as partridges and pheasants are now for the gun.

its daring, however, is proverbial. Not unfrequently does it sweep into the farmyard and bear off a chicken from before the eyes of the indignant farmer's wife.

The kite is known by its long forked tail and calm gliding motion through the air. Its food is miscellaneous, consisting of moles, chickens, leverets, rats, and mice. The length is about 24 inches, but the bird is not often seen in England.

The common buzzard is chiefly found in wooded districts, where it watches for the appearance of prey, upon which it dashes out suddenly from its ambush. This habit arises from the bird's unfitness for rapid flight, which presents a sure pursuit. The buzzard is about twenty inches long, and may frequently be seen.

With this brief enumeration of the falcons we must conclude the present article, reserving for the next the natural history of the strigidae or owl family, with some notices of the Laniidae or butcher birds.

THE VULTURE.

Reading for the Young.

A LESSON FROM THE THRUSH;

BEING

Part of a Letter to a young Pianoforte-player.

I CAN tell you that the little musicians of the grove do not attain their wild and delicate modulation without practice. When I lay in bed last summer, unable to speak or move for many hours in the day, the song of the birds furnished me with an inexhaustible source of amusing observation. I could not but feel grateful to the melodious little creatures which beguiled me of half my pain, and made the weary hours of sickness fly away upon wings as light as their own. As if led by an instinctive sympathy, numbers of blackbirds and thrushes came to build their nests round our garden, and the wood pigeons, which had been silent the year before, renewed their soft notes in the high trees by the parsonage lawn. However, they were shy, and I thought myself fortunate if once or twice in the day their gentle cooing found its way to my ear. But there was one thrush whose notes I soon learned to distinguish from all the other thrushes; indeed, his skill seemed to exceed theirs as much as Cordoba's exceeds yours and mine. Every morning I listened for his voice, which was sure to precede the matins of all other birds. In the day time his brilliant tones were mingled

and almost lost in the general melody, but, as soon as the sun was preparing to set, when the black-birds had either sung themselves to sleep, or were flown off to their festivities elsewhere, then was my thrush's practising time. He was kind enough to select a tree not far from my window, while the other thrushes placed themselves at a respectful distance, and edged in a note here and there as they could. He opened the rehearsal with a number of wild trills and calls, which I could not well understand, only they were very sweet and cheering to me; and he would pause between each till a soft response was heard from some distant bough. But when he had fixed on a little cadence which pleased him, it became a serious business. Strange to say, I could always tell when this would be, for what pleased me particularly was sure to please him; so true it is that nature has given the same perception of melody to men and to birds. He would chant it over in a low tone two or three times, as if to make himself sure of it; then he carolled it out with triumphant glee; then stopped short on a sudden, as much as to say to his rivals, "Which of you can imitate my strains?" Their notes sounded most sweet, at various distances, during these little intervals, but they seemed conscious of their inferiority to my favourite, which would suddenly break out into the very same melody, upon which he had doubtless been musing all the while, enriching it by some little note or trill, the wildest and most touching that ever came into a thrush's heart. I needed neither concert nor music-master while I could listen to the untaught, but not unpremeditated, harmony of this original professor, nor could I quarrel with the sickness which had been the means of developing another link in that mysterious chain which binds me to the rest of the creation, by opening my ear and my heart more than ever to the language of universal nature. But I often wished to have you with me, that you might hear how much pains the birds are at to charm us with their warbling. It is pretty, also, to hear the young birds commence their small, faltering strains, which grow clearer and louder, till they are no longer to be distinguished from the rest. True, it is their profession, and we have many other things to think of; but what time we do give to the study of music, we should give it with our hearts, as they do.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE OLD WATER-CRESS MAN.¹

BY H. K. C.

WHERE Wye with silver-flowing tide
Rolls on through meadows rich and wide,
An aged man was wont to roam:
At early dawn he left his home,
With scarce a covering on his head,
And you might count each single thread
Of his thin clothes, where clothes he had,
For he was miserably clad.
Of poverty and care the trace
Was ever stamp'd upon his face;

(1) See Engraving, page 51.

For he was *sad* and *very poor* ;
 No wanderer e'er from door to door.
 Your help and kindness needed more.
 But was his gait erect, and strong
 His footsteps as he went along.
 He needed strength ; for travail sore
 Was his to seek his daily store
 Of watercresses as they drank
 Their freshness by the river's bank.
 But, oh ! their beauty at the hour
 Of prime, nor that of many a flower
 Just opening her dewy eyes
 Beneath the morning skies,
 He heeded not. The glories bright
 Of mist and cloud in rosy light,
 The fleecy vapours in the vale,
 Unstirr'd as yet by morning gale,
 Spread like a lake among the trees,
 No taste had he for sights like these.
 Across the stream the moorhen flies,
 He sees ~~he~~ not, nor yet espies
 Her little velvet brood,
 Picking, like him, their food,
 But blither far than he.
 The grayling in the crystal tide
 Fleets like an arrow from the side,
 Where slow and dull his footsteps fall,
 But nought can his attention call,
 Not e'en the rushing waterfall,
 That makes the sweetest sound of all
 The things in nature musical.
 Now why should he so early look
 For watercresses in the brook ?
 Why clad so ill ? why doth he bear
 In his old face such gloom and care ?
 I know not what he was in youth,
 Or where he lived, and that is truth.
 But he in manhood's strength had striven,
 Forecasting that he might be driven,
 When age and weakness came, to want,
 Some little wealth—it was but scant—
 With careful labour to amass,
 And what he wish'd for came to pass ;
 For gold was gain'd and treasure made.
 But then the neighbours said,
 Gold should not lie, and do no good.
 Great words by him not understood
 They spoke ; but meanings he opined
 They bore, and so he hoped to find.
 Of funds, investment, interest,
 They knew but little at the best,
 And he knew less. But covetise
 How eager oft she seeks the prize,
 Though reckless how the pathway lies !
 So keen her wish, so fix'd her eyes
 On distant good, she will not brook
 Restraint, or on the danger look.
 Ah ! foolish man, with thoughts of gold
 Increased above a hundred fold—
 Thoughts haunting him in dreams by night,
 And haunting him when day was bright.
 But I must hasten to relate
 That all his earnings to a fate
 Were doom'd, to which on earth below
 Hard earnings oftentimes must bow—
 They make them wings, and fly away.
 Happy is he who then can say,
 The Lord who gave may take away !
 But resignation such as this,
 To know, alas ! it was not his.
 He lost his hoard, and with it lost
 His worldly hopes and patience : tost
 Thenceforth on waves of discontent,
 His fruitless weary hours were spent.
 Since his poor heart had felt the change,
 His words, his look, to all were strange.
 About his clothes he took no care,
 Squalid his mien and wild his stare.
 Harsh was his language to his wife ;
 His home it was a house of strife.
 In daughter, who of womankind
 Was none the best, he could not find
 Sweet recompense for loss of gain—
 She nothing did to soothe his pain.

Like the "three bears," as runs the fable,
 They lived, but not right amicable.
 Each had a spoon, and suppd alone ;
 Each had a chair and only one.
 They never walk'd abroad together,
 Not they, in foul or in fair weather,
 But wander'd forth at break of day,
 Each in a solitary way,
 And sought their food where'er they might,
 And home they brought it all at night :
 Oft stale, and hard, and dry the fare,
 And very strange the cookings were.

But to the purpose of my song :
 It is not to relate how long
 The trio thus together growling,
 And thus around the country prowling,
 Together lived, but unconnected.
 It could not last. He soon effected
 Clean riddance of them from his hold,
 But where *they* went I am not told :
 And, truth to speak, compassionate
 I cannot feel me in their fate.
 Yet it must be a dreary lot
 To have no dwelling-place, no spot
 To call one's own : "to lie at e'en
 In barns or kilns when blood is thin ;"
 To rise and beg a wretched meal,
 Or, failing that, to filch and steal ;
 A sad lot, it must be confess'd,
 E'en with "content to make it blest."
 'Tis said with weeping eyes they went :
I only hope they found content.

But he, the hero of my story,
 Whose life thenceforth I've put before ye
 In the beginning of this strain,
 He would not take them in again.
 He heeded not, though thin might be
 Their blood through pinching poverty,
 And shelterless they slept at night ;
 From his old heart was gone the light
 Of soft affection ; hope and love
 No more within his bosom strove.
 I've seen him wandering day by day
 With heavy step along the way ;
 I've watched him by the river's flow
 With haggard eye and wrinkled brow ;
 I've heard the tale, and often told,
 How he had lost his hopes and gold :
 So strange, so strong, he seem'd to be,
 So full of gloomy energy,
 That I had thought 'twas likelier I
 Than in short space that *he* should die.

But death must come : from greedy grave
 Sad heart and merry naught can save !
 A season I had gone away ;
 But tidings often came to say
 How things and folk went on at home.
 I little thought the news would come
 Which brings my story to an end,
 And finishes my hapless friend.
 But so it was. For he to drinking,
 As solace to his gloomy thinking,
 Was sore addicted ; and when smit
 With love of liquor deep, the fit
 Sometimes for many a week would last,
 And then all thought with him was past
 Of watercresses by the brook :
 He slept away in alehouse nook.
 At last—to speak it gives me pain—
 He slept, and never woke again.

No solemn warning minute-bell
 When he was buried toll'd the knell,
 But pull'd for him the church-bells all
 Rung merry at his funeral.
 Yet 'twas not joy that moved the throng,
 That bore the corpse, or pass'd along ;
 It was his wish, and they complied,
 It should be so whene'er he died.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

MRS. COUTTS'S VISIT TO ABBOTSFORD—1825.

"The much talked of lady who began life as Miss Harriet Mellon, a comic actress in a provincial troop, and died duchess of St. Albans, was making a tour in Scotland as Mrs. Coutts, the enormously wealthy widow of the first English banker of his time. No person of such consequence could, in those days, have thought a Scotch progress complete, unless it included a reception at Abbotsford; but Mrs. Coutts had been previously acquainted with Sir Walter Scott, who, indeed, had some remote connexion with her late husband's family through the Stewarts of Allenbank, I believe, or perhaps the Swintons of Swinton. He had visited her occasionally in London, during Mr. Coutts's life, and was very willing to do the honour of Teviotdale in return. But although she was considerate enough not to come on him with all her retinue, leaving four of the seven with which she travelled at Edinburgh, the appearance of only three coaches, each drawn by four horses, was rather trying to poor lady Scott. They contained Mrs. Coutts; her future lord, the Duke of St. Albans; one of his grace's sisters, a *dame de compagnie*, (vulgarly styled a toady); a brace of physicians, for it had been considered that one doctor might himself be disabled in the course of any expedition so adventurous; and, besides other menials of every grade, two bedchamber women for Mrs. Coutts's own person, she requiring to have this article also in duplicate, because in her widowed condition she was fearful of ghosts, and there must be one Abigail for the service of the toilette, a second to keep watch by night. With a little puzzling and cramming, all this train found accommodation; but it so happened that there were already in the house several ladies, Scotch and English, of high birth and rank, who felt by no means disposed to assist their host and hostess in making Mrs. Coutts's visit agreeable to her. They had heard a great deal, and they saw something, of the ostentation, almost inseparable from wealth so vast as had come into her keeping. They were on the outlook for absurdity and merriment; and I need not observe how effectually women of fashion can contrive to mortify, without doing or saying anything that shall expose them to the charge of actual incivility.

Sir Walter, during dinner, did everything in his power to counteract this influence of the *evil eye*, and something to overawe it; but the spirit of mischief had been fairly stirred, and it was easy to see that Mrs. Coutts followed these noble dames to the drawing-room, in by no means that complacent mood which was customarily sustained, doubtless, by every blandishment of obsequious flattery in this mistress of millions. He cut the gentlemen's sederunt short, and, soon after joining the ladies, managed to draw the youngest, and gayest, and cleverest, who was also the highest in rank, (a lovely Marchioness,) into his armorial hall adjoining. 'I said to her,' he told me, 'I want to speak a word with you about Mrs. Coutts. We have known each other a good while, and I know you won't take anything I can say in ill part. It is, I hear, not uncommon among the fine ladies in London to be very well pleased to accept invitations, and even, sometimes, to hunt after them, to Mrs. Coutts's great balls and fêtes, and then, if they meet her in any private circle, to practise upon her the delicate manoeuvre called *tipping the cold shoulder*. This, you agree with me, is shabby; but it is nothing new either to you or to me that fine people will do shabbiness for which beggars might blush, if they once

stoop so low as to poke for tickets. I am sure you would not, for the world, do such a thing; but you must permit me to take the great liberty of saying, that I think the style you have all received my guest Mrs. Coutts in, this evening, is, to a certain extent, a sin of the same order. You were all told, a couple of days ago, that I had accepted her visit, and that she would arrive to-day to stay three nights. Now, if any of you had not been disposed to be of my party at the same time with her, there was plenty of time for you to have gone away before she came; and, as none of you moved, and it was impossible to fancy that any of you would remain out of mere curiosity, I thought I had a perfect right to calculate on your having made up your minds to help me out with her.' The beautiful peeress answered, 'I thank you, Sir Walter; you have done me the great honour to speak as if I had been your daughter; and depend upon it, you shall be obeyed with heart and good will.' One by one, the other exclusives were seen engaged in a little *tête-à-tête* with her ladyship. Sir Walter was soon satisfied that things had been put into a right train. The Marchioness was requested to sing a particular song, *because* he thought it would please Mrs. Coutts. 'Nothing could gratify her more than to please Mrs. Coutts.' Mrs. Coutts's brow smoothed, and in the course of half-an-hour she was as happy and easy as ever she was in her life, rattling away at comical anecdotes of her early theatrical years, and joining in the chorus of Sir Adam's *Laird of Cockpen*. She staid out her three days!—saw, accompanied by all the circle, Melrose, Dryburgh, and Yarrow—and left Abbotsford delighted with her host, and, to all appearance, with his other guests."—*Lockhart's Life of Sir W. Scott*.

CLEVER people often make as great mistakes in judging those with whom they come in contact, as do stupid people; for the first give them credit for a *finesse* and ability to which they really may have no claim; and the second imagine that others are not more clever than themselves. Hence both parties pursue an erroneous line of conduct, based on false impressions, formed from judging of others by self.

A BRILLIANT reputation, like a mirror held before the sun, dazzles the beholders, who, annoyed by the light, assail the mirror with missiles in order to destroy it.

THE glitter of riches often serves to draw attention to the worthlessness of the possessor, as the light emitted by the glow-worm reveals the insect.

REVOLUTIONS are produced by the faults of those who govern, rather than by the force of those who subvert. One is the cause, the other but the effect.

ONE of the most striking proofs of the corruption of the times is, that a generous action seldom fails to be attributed to a bad motive.

AN avaricious man believes that money is the sure bait for gaining men. A vain man thinks praise the most irresistible.

MEN sometimes make a point of honour not to be disabused, and they had rather fall into an hundred errors than confess one.—*Burke*.

The Armada.

ATTEND, all ye who list to hear our noble England's praise,
I tell of the thrice famous deeds she wrought in ancient days,
When that great fleet invincible against her bore, in vain,
The richest spoils of México, the stoutest hearts of Spain.

It was about the lovely close of a warm summer day,
There came a gallant merchant-ship full sail to Plymouth Bay;
Her crew hath seen Castille's black fleet, beyond Aurigny's isle,
At earliest twilight, on the waves lie heaving many a mile.
At sunrise she escaped their van, by God's especial grace;
And the tall Pinta, till the noon, had held her close in chase.
Forthwith a guard at every gun was placed along the wall;
The beacon blazed upon the roof of Edgecumbe's lofty hall;
Many a light fishing-bark put out to pry along the coast;
And with loose rein and bloody spur rode inland many a post.

With his white hair unbenneted the stout old sheriff comes ;
 Behind him march the halberdiers, before him sound the drums ;
 His yeomen, round the market-cross, make clear an ample space,
 For there behoves him to set up the standard of her Grace.
 And haughtily the trumpets peal, and gaily dance the bells,
 As slow upon the labouring wind the royal blazon swells.
 Look how the lion of the sea lifts up his ancient crown,
 And underneath his deadly paw treads the gay lilies down.
 So stalked he when he turned to flight, on that famed Picard field,
 Bohemia's plume, and Genoa's bow, and Caesar's eagle-shield.
 So glared he when at Agincourt in wrath he turned to lay,
 And crushed and torn, beneath his claws, the princely hunters lay.
 Ho ! strike the flag-staff deep, sir knight : ho ! scatter flowers, fair maids :
 Ho ! gunners, fire a loud salute : ho ! gallants, draw your blades :
 Thou sun, shine on her joyously—ye breezes, waft her wide ;
 Our glorious SEMPER EADEM—the banner of our pride.
 The freshening breeze of eve unfurled that banner's massy fold ;
 The parting gleam of sunshine kissed that haughty scroll of gold ;
 Night sank upon the dusky beach, and on the purple sea,—
 Such night in England ne'er had been, nor e'er again shall be.
 From Eddystone to Berwick bounds, from Lynn to Milford Bay,
 That time of summer was as bright and busy as the day ;
 For swift to east and swift to west the warning radiance spread ;
 High on St. Michael's Mount it shone—it shone on Beachy Head.
 Far on the deep the Spaniard saw, along each southern shore,
 Cape beyond Cape, in endless range, those twinkling points of fire ;
 The fisher left his skiff to rock on Tamar's glittering waves,—
 The rugged miners poured to war from Mendip's sunless caves.
 O'er Longleat's towers, o'er Cranbourne's oaks, the fiery herald flew ;
 He roused the shepherds of Stonehenge, the rangers of Beaulieu.
 Right sharp and quick the bells all night rang out from Bristol town,
 And ere the day three hundred horse had met on Clifton down ;
 The sentinel on Whitehall Gate looked forth into the night,
 And saw o'erhanging Richmond Hill the streak of blood-red light.
 Then bugle's note and cannon's roar the death-like silence broke,
 And with one start, and with one cry, the royal city woke.
 At once on all her stately gates arose the answering fires ;
 At once the wild alarum clashed from all her reeling spires ;
 From all the batteries of the Tower pealed loud the voice of fear ;
 And all the thousand masts of Thames sent back a louder cheer :
 And from the furthest wards was heard the rush of hurrying feet,
 And the broad streams of flags and pikes dashed down each roaring street ;
 And broader still became the blaze, and louder still the din,
 As fast from every village round the horse came spurring in :
 And eastward straight, from wild Blackheath, the warlike errand went,
 And roused in many an ancient hall the gallant squires of Kent.
 Southward from Surrey's pleasant hills flew those bright couriers forth ;
 High o'er bleak Hampstead's swarthy moor they started for the north ;
 And on, and on, without a pause, untired they bounded still ;
 All night from tower to tower they sprang—they sprang from hill to hill :
 Till the proud peak unfurled the flag o'er Darwin's rocky dales—
 Till like volcanoes flared to heaven the stormy hills of Wales—
 Till twelve fair counties saw the blaze on Malvern's lonely height—
 Till streamed in crimson on the wind the Wrekin's crest of light—
 Till broad and fierce the star came forth on Ely's stately fane,
 And tower and hamlet rose in arms o'er all the boundless plain ;
 Till Belvoir's lordly terraces the sign to Lincoln sent,
 And Lincoln sped the message on o'er the wide vale of Trent ;
 Till Skiddaw saw the fire that burned on Greta's embattled pile,
 And the red glare on Skiddaw roused the burghers of Carlisle.

Right Hon. T. B. Macaulay.

THE SEIKS AND THE SINGHS.

(CONCLUDING ARTICLE.)

RUNJEET SINGH, having obtained a local habitation and a name in the Punjaub, proceeded to strengthen his position, and enlarge his dominions, much to the dismay of the independent Sirdars. These Sirdars, however, were so distracted by dissensions amongst themselves, that they never formed any united stand against the encroachments they saw daily going on, and the embarrassments of the Affghan kingdom invited Runjeet to further usur-

pations near the Indus. In 1808 he had attained to such a height of power, that the British Government thought it advisable to open negotiations with the Lahore monarch, but, his ambitious views being yet unsatisfied, he fought shy for some time, and showed little disposition to come to terms. The late Governor-General of Canada, Lord Metcalfe, conducted the negotiations on our behalf, and his skill, assisted by a show of military force, succeeded in convincing the valorous Runjeet that a contest with us would be hopeless, and a treaty was at

length concluded, by which he engaged not to encroach upon states under our protection. The superior discipline of our troops induced the Rajah to attempt to train his own on the European plan, and in this design he was assisted by some French and Italian officers, who, upon presenting themselves at his court, were readily engaged in his service. Cannon foundries, powder magazines, and manufactories of arms, were established, and a large body of troops so well organized, that the whole of native India could not show their equal. The success of his arms continued, and the districts of Mooltan, Cashmir, and Peshawur, were successively added to his dominions. Another treaty between the Rajah and the British Government was signed in 1835, when an interview took place between Lord William Bentinck and Runjeet, in a style of great magnificence. A few years previously, Sir Alexander Burnes had been entrusted with presents from the English monarch to Runjeet, and the flattering compliment thus paid him was acknowledged by the splendid reception given to the envoy.

"The seasons," said the Rajah's Master of the Ceremonies to Burnes and his companions, "have been changed to aid your safe arrival; and when it should have rained, the sun shines; but it is the sun of England. You must now consider yourselves at home; and in a garden, of which you are the roses. Such a friendship has now grown up between the British and the Seiks, that the inhabitants of Iran and Room will hear it proclaimed in their distant dominions. Light has succeeded to darkness when you came from amongst the barbarians of Sinde, and its genial influence has changed the bud into the rose." The presents consisted of five of the largest horses that could be found in England, and a carriage. When the horses were brought into Runjeet's presence, and the letter of greeting read, he ordered a salute of 60 guns to be fired twenty-one times. The immense size of the horses particularly struck him; he called them little elephants. The letter of thanks, sent in reply to the Governor-General, contains passages of such extravagance, that a short extract will amuse our readers:—"At a happy moment, when the balmy zephyrs of spring were blowing upon the garden of friendship, and wafting to my senses the grateful perfume of its flowers, your Excellency's epistle, every letter of which is a new-blown rose on the branch of regard, and every word a blooming fruit on the tree of esteem, was delivered to me by Mr. Burnes and Mr. John Leckie, who were appointed to convey to me some horses of superior quality, of singular beauty, of alpine form, and of elephantine stature. These presents have been delivered to me by that night-ingale of the garden of eloquence, that bird of the winged words of sweet discourse, Mr. Burnes, and the receipt of them has caused a thousand emotions of pleasure and delight to arise in my breast. The animals, in beauty, stature, and disposition, surpass the horses of every city, and every country in the world. On beholding their shoes the new moon turned pale with envy, and nearly disappeared from the sky. Such horses the eye of the sun has never before beheld in his course through the universe. Unable to bestow upon them, in writing, the praises that they merit, I am compelled to throw the reins on the neck of the steed of description, and relinquish the pursuit." Another interview took place between Runjeet Singh and the Governor-General, then Lord Auckland, in 1838, when the former was

observed to be gradually sinking. He died of a dropsy in June 1839, at the age of fifty-nine. His four wives and five of his Cashmirian slaves burnt themselves on his funeral pile, and his prime minister, Dihan Singh, was with difficulty restrained from throwing himself into the flames also. The Rajah's personal appearance was mean in the extreme; his height was not more than five feet three inches; he was terribly marked with the small-pox, and was blind of an eye. His remaining eye was a fine organ, fiery and piercing; and those who saw him were obliged to confess that there was no common degree of intellect and acuteness to be found upon perusal in his countenance, however repulsive its first appearance might be. In early life he was a generous rewarder of the gallantry of his troops, but latterly he got extremely avaricious, and he allowed the pay of his army to be so far in arrear, that some regiments were sometimes on the point of open revolt. His esteemed foreign officers had frequently to petition for payment of sums due to them. He is described as possessing a cool determined courage, that neither courted unnecessary danger, nor shunned any which it was expedient to encounter—great powers of endurance—an intuitive perception of character—a retentive memory—a rich fertility of invention and resource—a subtle foresight. This combination of qualities seemed destined by nature to push their owner forward to distinction, and the achievement of greatness. His evil qualities, on the other hand, were not wanting. They were such as history has taught us to look for in an Eastern character. Sensual to an excess; insensible to remorse, when he could safely indulge his cruelty he was stopped by no considerations of pity; unscrupulously ambitious; and so utterly uneducated that, to the end of his days, he could neither read nor write. The kingdom he left behind was composed of incompatible materials, that adhered by the force of pressure only; and when his commanding intellect disappeared, disorders broke out on all sides. His annual revenue amounted to about two and a half crores of rupees (2,500,000*l.*); and of this sum Cashmir furnished thirty-six lacs (360,000*l.*) When he died, it is said there were forty millions sterling in his coffers. His army consisted of a standing force of 75,000 men, 25,000 of which were infantry, the rest regular and irregular cavalry. His park of artillery had 150 guns. The pay of his troops was higher than that of the troops in the East India Company's service, but it was sometimes nearly two years in arrear.

* Runjeet Singh was succeeded by his son, Kurruck Singh, then thirty-seven years old. He lacked all talent for governing, and he died in little more than a year after his accession. Kurruck's son, Noo Nehal Singh, a youth nineteen years old, was the next occupant of the throne, but scarcely had he seated himself than he came to an untimely end. He was killed by the fall of an archway, as he rode on horseback underneath. Foul play has been suspected in both these deaths. Kurruck Singh's wife, then between forty and fifty years of age, next undertook the government; but discontents broke out, and Shere Singh, a natural son of Runjeet, marched a body of several thousand men to Lahore, and besieged the Ranee (the queen) in her capital, for five days, until the place yielded. Soon after Shere Singh seized the command, the Ranee was found dead in her apartment, her skull having been shattered by four of her female slaves. Shere Singh

had remained, in name, master of the field for nearly three years, a period which, to those who loved change, was an age too long; whereupon Ajeet Singh, one of Runjeet's favourite sirdars, a man, from all accounts, of extraordinary beauty, and of ferocity equal to his beauty;—this man, in conjunction with Dihan Singh, Runjeet's confidential minister, plotted the death of the rajah. The bloody deed was effected by Ajeet personally—he shot his master in the forehead, and then, within a few hours, he assassinated the rajah's only son, a youth of engaging disposition and appearance; and to make a good day's work complete, he murdered that youth's infant, a child who had seen the light but four and twenty hours. Thus ended the house of Shere Singh. Then came the task of dividing the spoil between the minister and the murderer. They both got into a carriage and discussed the matter as they drove along. Almost as a matter of course they quarrelled, for each wanted more than his share. With all Ajeet's faults he was a man of decided character, and to shorten a disagreeable discussion, he drew a pistol and shot his companion through the head, as the carriage was passing along the street. Apparently Ajeet was master of the Lahore state, but there were some powerful chiefs with whom he thought it dangerous to contend, namely, Heera Singh, the son, and Suchet Singh, and Gholah Singh, the brothers of the late minister. Under these circumstances it was considered advisable to select some one who might nominally rule, whilst the rival chiefs shared the sweets of power. They found a youth called Dhulip Singh, whom they styled the son of Runjeet, (whether truly so or not is a matter of doubt,) and him they placed upon the throne. The army, which had hitherto been patient lookers-on, now broke loose, and committed such excesses in the capital as are usually known to take place only when an enemy's city is captured. After this tumult was quieted there ensued such scenes of discord and intrigue amongst the rival chiefs, that we confess ourselves unable to trace them—nor, indeed, are we in possession of very accurate information on the subject. Enough, however, has been said to show the state of anarchy into which that once well-regulated kingdom has been thrown. To allow such a state of things to continue so near our own territories, were, surely, not the best policy; and now that a *casus belli* has been most indubitably made out, it is a duty we owe both to ourselves and to the afflicted people of the Punjab to restore peace to that country, by taking possession without further delay. How far we might have been justified in seizing the territory at an earlier period, we leave to political moralists to decide. Now, there can be no doubt that we shall but mildly exercise a righteous vengeance for the slaughter of our friends and countrymen on the banks of the Sutlej, by pinioning the Seik arm, and taking effectual means to prevent disturbances for the future.⁽¹⁾

The state of Lahore, as left by the old Lion, consisted of the Punjab proper, and the provinces of Cashmir, Peshawur, and Mooltan. The word Punjab literally signifies five rivers. Its name is derived from the fact of five rivers traversing the district, which when combined form the Indus. These streams all issue from the Himalayan chain, and their names are the Indus, Jeelam, Chanaub,

Ravi, and Sutlej. The shape of the Punjab, as an inspection of the map will show, is triangular, having its apex directly towards the Indian ocean, and the base against the Himalaya. The Indus, a river of historical interest as well as of importance for its magnitude, forms one side of the triangle, and the Sutlej, on the banks of which the recent bloody engagements took place, forms the other side. When Alexander the Great invaded India he crossed the Indus near Attock, where a tributary stream of considerable volume pours in its waters. Only a few Greek remains have been discovered, although there has been a good deal of research and conjecture. It is known that Bucephalus, Alexander's favourite steed, died in this region, and some imagine they have discovered his burial-place on the banks of the Jeelam. The great battle with Porus was fought somewhere in the same neighbourhood, but the spot has not been accurately identified. The sources of the Indus have never yet been explored; its course is computed to be about one thousand two hundred miles in length, and it is usually considered to form for all that distance the boundary of Hindostan. At the point where it is joined by the other streams of the Punjab, it is about three thousand feet wide, with a depth of twelve feet when the water is lowest. The ancient name of the Jeelam was Hydaspes, and the Hindoos still call it by a corruption of that name, Vettusta. The word Hydaspes falling easily into metre is frequently met with in Latin poetry, and it was often used without much reference to local peculiarity.⁽¹⁾ The tracts of country between the rivers are called *Duabs*, and that lying between the Indus and the Jeelam is represented as mountainous in its northern part, and a treeless flat elsewhere. Large droves of wild horses scamper across the level district, feeding at will on the pasture. Between the Jeelam and the Chanaub, the soil is stated to be good, but cultivated only to a trifling extent. It is level, and almost an unbroken pasture. There are some tolerably large towns in the district between the Chanaub and the Ravi; the country is flat, not very productive, and on a higher level than the other divisions. The remaining *duab* contains the great towns of the Punjab, many of which are in a state of decay. That part of it which is enclosed by the river Beeya and the Sutlej, is stated to be the most fertile district in the whole Punjab, there being an abundance of water, and the soil is light. The mountainous country in the neighbourhood of the Himalaya is termed Kohistan, and is possessed by chiefs who have never been entirely subjugated by the ruler of the Punjab, although most of them have acknowledged the superiority of the Singhs by furnishing a contingent in time of war, and paying a tribute.

The inhabitants of the Five Rivers country are computed to amount to four millions; they consist of Seiks, Mussulmen, Affghans, Jats, and other Hindoo tribes. The accounts of travellers as to the

(1) Thus in one of Claudian's poems (*De Raptu Proserpine*, l. 324,) where Ceres, bewailing the loss of her daughter Proserpine, who had been carried off by Pluto when gathering flowers in the fair field of Enna, expresses her determination to seek the fairest flower of all throughout the world, she is made to say that sunset should see her treading the African Atlas, and her torches should glitter on the Asiatic Hydaspes. It is otherwise when Lucan (*Pharsalia*, l. 235,) mentions that the mighty stream of the Indus, pouring rapidly along in many a whirlpool, scarcely acknowledges the contributions of the Hydaspes. Or when Horace, in that Ode where he commends a stainless life, enumerates amongst the perilous places of the earth, those through which the celebrated (fabulous) Hydaspes flows.

(1) See the Note to the former paper on this subject, p. 49.

productiveness of the country differ considerably, but they all seem to agree in stating that a small part only has been cultivated, probably not more than a fourth or a third. As might be expected, the soil is richest, and cultivation has proceeded furthest, in the vicinity of the great streams. Wheat, barley, peas, and rice are grown; the sugar cane thrives well, and its produce is sent out of the country; indigo is exported; salt is found in vast quantities in the mountains situate between the Indus and the Jeelam; the iron mines are extensive, and nitre is gathered in an efflorescent state from the plains. Notwithstanding the summer heats, the climate is not warm for a sufficient length of time to mature the most profitable plants of Hindostan, and the winters are cold. The shawls of Cashmir are sent to Europe entirely through this region; cotton goods of excellent texture are manufactured by native weavers. In Mooltan the silkworm is much attended to, and the silk is highly prized. The British have supplied the inhabitants for some time with metal instruments and vessels, as well as with chintz and woollens. The government derived its revenue principally from taxes on land and agricultural stock. The land-tax was paid on an estimate of the product of the soil, and hence in levying it many abuses were committed. Mr. Moorcroft mentions a singular method of coming at an estimate in one district. A given quantity of earth was put into a fine muslin sieve, and washed with water until all the mould was carried through, and nothing but sand left, and according to its proportion to the whole a deduction was made from the assessment. Four rupees for two begas was the rate for a rich soil; three if it contained one fourth of sand; two if it had one-half; and one where the sand was three-fourths of the quantity. The shawl manufacture of Cashmir yielded a considerable sum to the government. The salt mines were altogether in the hands of the government, and, notwithstanding they exacted a profit of more than a thousand per cent, the salt was sold at a third of the price of that of Bengal.

Of the four millions that people the Punjaub, Burnes computes the Seik population at not more than 500,000. The language spoken by the Seiks is a corruption of the Hindostanee. The head of the church is called Sahil Singh; he possesses great power over the tribe, and even Runjeet at the height of his authority was jealous of him. Irreligious himself, the Rajah saw the necessity of conciliating the priesthood. Two priests were constantly about his person, whose precepts he reverentially listened to, but systematically disobeyed. Runjeet made Lahore and Amritsir alternately his residence. The first city had been the capital where the Mogul's Viceroy resided. It contains about 80,000 inhabitants, and is surrounded by a rampart eight miles in circuit. The houses are tall, built of brick, and with flat roofs. The streets are unpaved and narrow; a kennel runs down the middle of each. They are always in a dirty condition, and in wet weather they are scarcely passable for Europeans. The city in former times has been much larger than it is at present. It extended from east to west, for a distance of five miles, and had a breadth of three. Mosques and tombs that were once within the walls, are now falling to ruin amongst the fields. The bazaars are the liveliest part of the city, but they do not exhibit

much of the wealth of the Oriental shops, catables being the principal articles on sale. There are a few public buildings that deserve mention, but the most splendid edifices lie outside the walls. The royal mosque has been converted into a powder magazine. There are four minarets still standing. It is a building of red sandstone, constructed by Aurungzebe. The celebrated tomb of the Emperor Jehangir, (Hand of the World,) called Shah Dura, is on the opposite side of the Ravi. It is of quadrangular shape, having a minaret seventy feet high at each corner. It is constructed of alternate blocks of white marble and red sandstone, and the interior contains some fine mosaic work. Over the entrance there are two lines of black letters on a white ground, declaring the name and titles of him to whose memory the tomb was erected, and there are many inscriptions of the word "Allah," in Persian and Arabic letters, in various parts. A sarcophagus of white marble stands in the middle, covered with inscriptions. The dome that originally hung over the sarcophagus, was removed by Bahadur Shah, that the dew and rain of heaven might fall on the tomb of his illustrious ancestor. The whole is in a sad state of decay. When Dost Mahomed's brother was at Lahore, he took up his residence in Shah Dura, and inflicted great injury upon it by lighting fires in the hall, regardless of consequences. The whole is surrounded by a garden, adorned with numerous fountains, and four canals radiating from the centre. Adjoining the garden is a caravanserai, containing four hundred dwellings, and near at hand is the resting-place of Nourjehan, (Light of the World,) Jehangir's beautiful empress. Her tomb is also in ruin, and the only part of it that receives any attention is the marble sarcophagus. The summer palace used by Runjeet was called Shalimar, (House of Joy,) in the garden of which four hundred and fifty fountains threw up their waters to cool the air. The place was laid out by the Emperor Shah Jehan, who reigned from 1627 to 1656. A canal has been laboriously brought from a great distance to supply the requisite quantity of water. Sir Alexander Burnes was sixty days in sailing with a favourable navigation from the sea to Lahore; but he says that a boat might reach the sea in fifteen days from that city. Amritsir, (Fountain of Nectar,) the holy city of the Seiks, is thirty miles from Lahore. It is the present capital of the Punjaub. It is stated to be larger than Lahore, and is a place of greater importance, in consequence of its being the emporium of trade between India and Cabul. It is supplied with water by a canal from the Ravi. The sacred reservoir which gives a name to the city, is lined with brick, and is one hundred and thirty-five paces square. The national temple, a place of pilgrimage for the Seik sect, is dedicated to Gooroo Govind. The great book of their religion is preserved here with great reverence. A priest fans it with the tail of a Tibet cow, to keep away impurity, when he is not employed in reading it to the assembled worshippers. In the vicinity is a large building, inhabited by Acalees to the number of four or five hundreds. These people take their name from a word signifying 'never dying.' They are a set of fanatics, who make a point of insulting their neighbours in every possible way. Even the terrible Runjeet did not escape. They openly reviled him whenever he came into public, and sometimes did not scruple to attempt his life. Their violence

is frequently so great that lives are lost. They will acknowledge no superior; their dress is blue, as commanded by Govind, with a turban of a peculiar shape. Round their turban they carry several quoits, or rings of iron, as weapons of offence. These rings are from eight to fourteen inches in diameter, and their mode of using them is to twirl them rapidly round their finger or a stick, and then having acquired an impetus, they are projected with such a force, that anything of moderate bulk coming in contact with the sharpened outer edge is severed in two. A man's head or a limb has been known to be cut off by these quoits.

THE PONT DU GARD.

"Dumb are its fountains, and their channels dry."

ABOUT fifteen miles from Nîmes, a town in the south-east of France, there stands one of the most splendid relics of the Roman empire now in existence. We allude to the celebrated Pont du Gard, an edifice which takes its name from the river Gardon, over which it is built. Every one who has beheld this vestige of antiquity speaks in glowing terms of its beauty and majesty. It spans, at a height of 188 feet, and for a length of 878 feet, the narrow but beautiful valley of Gardon; and was originally constructed for the purpose of conveying to the town of Nîmes, the waters of two springs fourteen miles distant. The river which it crosses takes its rise in the Cevennes, and runs eastward until it swells the waters of the Rhone. The aqueduct is made up of three rows of arches, piled upon one another, and forming in fact three bridges. The lowest of these bridges is 65 feet high, and 530 feet long. It has six arches, under the fifth of which alone the waters of the river usually flow. This arch has a width of 83 feet. The second bridge, consisting of eleven arches, rises to a height of 63 feet above the first, five of whose foundations serve for the support of the upper erection. Lastly, upon this second bridge stand the small arches, 35 in number, of the highest bridge, 25½ feet only above that beneath. The arches of all the tiers spring from a support in the ogee shape, having a height of 1½ ft. The two lower stories of the bridge are formed of hewn stones, placed together without the aid of cement. The quarry which furnished the stones is on the left bank of the river, a little below the bridge.

It has been already stated that all this vast edifice was constructed simply to carry a little stream of water across the ravine, through which the Gardon pours its waters, an end which would now be accomplished by a few iron pipes. The water-course is over the highest tier of arches: it is five feet high, and four wide. It remains perfect enough, after a lapse of more than eighteen centuries, to allow its being traversed from end to end. This canal is lined with a thick impenetrable coat of cement, and is covered with slabs, along which a man may walk, and survey at this altitude the rocky banks of the river. Traces of red paint are yet to be found upon the sides of the conduit, evidently placed there originally to prevent filtration. The bottom is made up of small stones, firmly embedded in a cement, formed of sand and lime, eight inches thick. The two springs, whose waters the colony at Nîmes were at so much pains to procure, were called Airan, and Eure, the former being connected with the latter by a small aqueduct, of which vestiges

are yet to be seen. After being thus made artificially confluent, the united stream was carefully conducted to the stupendous bridge built to receive it, and thence to Nîmes. Although the springs were distant from that place by the most direct road only fourteen miles, yet the necessity of a longer course, for the purpose of obtaining a uniform flow, increased that distance to twenty-one miles.

The name of the builder of the Pont du Gard, and the date of its construction, seem to be alike forgotten. The most plausible conjecture assigned it to M. Agrippa, the son-in-law of Augustus, who is supposed to have commenced it when he was sent, B. C. 19, to regulate the affairs and appease the turbulence of the Gauls. It is known that during his residence on that occasion, Agrippa benefitted the country by four grand roads; and it is natural to suppose that he who obtained at Rome the high title of *Curator perpetuus aquarum*, (Perpetual Guardian of Waters,) would not overlook the wants, in this respect, of Nîmes, a colony founded by Augustus himself. It has been supposed that the principal cost of the edifice was defrayed by the colony itself, on account of a bas-relief of the heathen deity, Priapus, found sculptured upon one side of the bridge, that deity being the symbol of the town. "As a fine and imposing object," says Inglis, "in connexion with the surrounding scenery, the Pont du Gard is worth a pilgrimage; as a relic of other days, it is wonderful and impressive. We know not the precise era of its construction, but we know that two thousand years have nearly elapsed since the Roman workmen rested upon its summit and threw down their tools. All that these Romans attempted was commensurate with the extent and seeming stability of the empire; but they guessed not that the work of their hammer and chisel would outlive a thousand years the glory of that empire. I do not know whether the greatness of this monument is most conspicuous seen from below or from its summit. The traveller must view it from both positions. I remained long seated underneath a rock, about three hundred yards down the river: and from this spot, the union of the grand and the picturesque, of the wild and romantic features of nature, with majestic and unperishing works of art, is complete. I turned away unwillingly from this imposing monument, which I yet often see in fancy spanning the deep valley, seeming like a bridge constructed for the use of giants, rather than of men,—the work, too, of colossal hands." Towards the commencement of the seventeenth century a carriage road was attempted to be formed upon the lowest tier of arches. Some progress had been made when, in 1699, the superintendent Bâville, with a laudable zeal for the protection from injury of this antique edifice, caused it to be inspected by two skilful architects. Upon their report being made, the states general of Languedoc forbade the formation of any road-way, except one sufficient for horse and foot passengers. A carriage road of some kind was, however, much desired by the public, principally on account of the frequent overflows of the river at many periods of the year, when all crossing, even in boats, was prevented. It was then attempted to form such a road without injuring the bridge. After a careful examination, the states general of the province determined to build a separate bridge against the eastern face of the ancient one. By this means it was proposed to secure two advantages to travellers. The one, that of passing the river at all times without danger; the other, that they might be able to gratify their curiosity, and consider at leisure the beauty and magnificent proportions of this remarkable monument. The lowest tier of arches was accordingly widened, and the present roadway constructed in 1747. The modern bridge is fine and elevated, but looks insignificant beside its ancient neighbour.

FRANK FAIRLEIGH;

OR,
SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. V.

WHEN we returned to the pupils' room after dinner, Lawless found, lying on the table, the note Dr. Mildman had written in such a mysterious manner before he left home in the morning, and proceeded to open it forthwith. Scarcely had he glanced his eye over it, when he was seized with so violent a fit of laughter, that I expected every moment to see him fall out of his chair. As soon as he had in some measure recovered the power of speaking, he exclaimed, "Here, listen to this, and tell me if it is not the very best thing you ever heard in your lives." He then read as follows:—

"It is not without much pain that I bring myself to write this note; but I feel that I should not be doing my duty towards your excellent father, if I were to allow such extreme misconduct on the part of his son to pass unreprieved. I know not towards what scene of vulgar dissipation you might be directing your steps, but the simple fact, (to which I myself was witness,) of your leaving my house in the low disguise of a carter's smock frock, affords in itself sufficient proof that your associates must belong to a class of persons utterly unfitted for the companionship of a gentleman. Let me hope this hint may be enough, and that conduct so thoroughly disgraceful in one brought up as you have been, may not occur again. I presume I need scarcely say, that in the event of your disregarding my wishes upon this point, the only course left open to me would be to expel you, a measure which it would deeply grieve me to be obliged to enforce."

His voice was here drowned by a chorus of laughter from all present who were aware of the true state of the case, which lasted without interruption for several minutes. At length Lawless observed, "I tell you what, it will be a death-blow to Smithson; a Macintosh made by him to be taken for a smock frock! he'll never recover it." "Mildman might well look like a thunder-cloud," said Coleman, "if that was the notion he had got in his head; what a jolly lark, to be sure!" "How do you mean to undeceive him?" inquired Cumberland. "Oh, trust me for finding a way to do that," replied Lawless; "the low disguise of a carter's smock frock, indeed! What fun it would be if he were to meet my governor in town to-day, and tell him of my evil courses! why the old boy would go into fits. I wonder what he means by his 'scenes of vulgar dissipation.' Fancy me playing all-fours with a beery coal-heaver, and kissing his sooty-faced wife; or drinking alternate goes of gin and water with a dustman, for the purpose of insinuating myself into the affections of Miss Cinderella Smut, his interesting sister. By Jove, it's as good as a play!"

More laughter followed Lawless's illustrations of Dr. Mildman's note, a subject we continued to discuss for some time. At length there was a pause, when I heard Coleman whisper to Lawless, "Thomas was pretty right in saying that new fellow knows how to make himself comfortable, at all events." "He's a great deal too free and easy to please me," muttered Lawless, in an under tone; "I shall take the liberty of seeing whether his self-possession cannot be disturbed a little. I have no notion of such airs. Here, Mullins!" And laying hold of Mullins by the arm, he pulled him into a chair by his side, and proceeded to give him some instructions in a whisper. The subject of their remarks, Harry Oaklands, who had, on re-entering the room, taken possession of the three chairs near the window, was still reclining, book in hand, in the same indolent position, apparently enjoying the beauty of the autumnal sunset, without concerning himself in the slightest degree about anything which might be going on inside the room.

Lawless, whose proceedings I was watching with an anxious eye, having evidently succeeded, by a judicious mixture of bullying and cajolery, in persuading Mullins

to assist him in whatever he was about to do, now drew a chair to the other side of the window, and seated himself exactly opposite to Oaklands. "How tired hunting makes a fellow! I declare I am regularly baked, used completely up," he observed, and then continued, glancing at Oaklands, "Not such a bad idea, that. Mullins, give us a chair; I don't see why elevating the extremities should not pay in my case, as well as in other people's." He then placed his legs across the chair which Mullins brought him, and folding his arms so as exactly to imitate the attitude of his opposite neighbour, sat for some minutes gazing out of window, with a countenance of great solemnity. Finding this did not produce any effect on Oaklands, who having slightly raised his eyes when Lawless first seated himself, immediately cast them upon the book again, Lawless stretched himself, yawned, and once more addressed Mullins. "Shocking bad sunset as ever I saw,—it's no go, staring at that. I must have a book—give me the Byron." To this Mullins replied "that he believed Mr. Oaklands was reading it." "Indeed! the book belongs to you, does it not?" Mullins replied in the affirmative. "Have you any objection to lend it to me?" Mullins would be most happy to do so. "Then ask the gentleman to give it to you,—you have a right to do what you please with your own property, I imagine!" It was very evident that this suggestion was not exactly agreeable to Mullins; but his habitual fear of Lawless was so strong as completely to overpower any dread of what might be the possible consequences of his act. Still it was not without much hesitation that he approached Oaklands, and asked him for the book, "as he wished to lend it to Lawless." On hearing this, Oaklands leisurely turned to the fly-leaf, and having apparently satisfied himself, by the perusal of the name written thereon, that it really belonged to Mullins, handed it to him without a word. I fancied, however, from the stern expression of his mouth, and a slight contraction of the brow, that he was not as insensible to their impertinence as he wished to appear.

Lawless, who had been sitting during this little scene, with his eyes closed, as if asleep, now roused himself, and saying, "Oh, you have got it at last, have you?" began turning over the pages, reading aloud a line or two here and there, while he kept up a running commentary on the text as he did so;—"Hum! ha! now let's see, here we are,—the 'G-I-A-O-U-R,' that's a nice word to talk about; what does G-I-A-O-U-R spell, Mullins? you don't know? what an ass you are, to be sure!—"

'Fair clime, whose every season smiles
Benignant o'er those blessed isles'—

blessed isles, indeed, what stuff!—

'Tis Greece, but living Greece no more;

that would do for a motto for the barbers to stick on their pots of bear's grease—

'Clime of the unforgotten brave;

unforgotten, yes! I should think so; how the deuce should they be forgotten, when one is bored with them morning, noon, and night, for everlasting, by old Sam, and all the other pastors and masters in the kingdom! Hang me, if I can read this trash; the only poetry that ever was written worth reading is 'Don Juan;'—He then flung down the book, adding, "It's confoundedly cold, I think. Mullins, shut that window." This order involved more difficulties in its execution than might at first be imagined. Oaklands, after giving up the book, had slightly altered his position, by drawing rather nearer the window, and leaning his elbow on the sill, so that it was impossible to shut it without obliging him to move. Mullins saw this, and seemed for a moment inclined not to obey, but a look and a threatening gesture from Lawless again decided him; and with slow unwilling steps he approached the window, and laid his hand on it, for the purpose of shutting it. As he did

so, Oaklands raised his head, and regarded him for a moment with a glance like lightning, his large eyes glaring in the twilight like those of some wild animal while the red flush of anger rose to his brow, and we all expected to see him strike Mullins to the ground. Conquering himself, however, by a powerful effort of self-control, he folded his arms, and turning from the window, suffered Mullins to close it without interruption. —Still I could perceive, from the distended nostril and the quivering of his lip, that his forbearance was almost exhausted. "Ah, that's an improvement," said Lawless. "I was getting uncommonly chilly—by the way, what an interesting virtue patience is; it is a curious fact in Natural History, that some of the lower animals share it with us; there's nothing so patient as a jackass—" "Except a pig," put in Mullins; "they're uncommon—" "Obstinate," suggested Coleman. "Oh, ah! it's obstinate I mean," replied Mullins. "Well, you know, donkeys are obstinate, like a pig, that's what I meant." "Don't be a fool," said Lawless;—"Deuce take these chairs, I cannot make myself comfortable any how—the fact is, I must have three, that's the proper number—give me another, Mullins." "I can't find one," was the answer; "they are all in use." "Can't find one nonsense," said Lawless; "here, take one of these; the gentleman is asleep, and won't object, I dare say." When Mullins was shutting the window, his head had been so turned as to prevent his observing the symptoms of anger in Oaklands, which had convinced me that he would not bear trifling with much longer. Presuming therefore, from the success of his former attacks, that Oaklands was a person who might be insulted with impunity, and actuated by that general desire of retaliation, which is the certain effect bullying produces upon a mean disposition, Mullins proceeded, *con amore*, to fulfil Lawless's injunction. With a sudden snatch, he withdrew the centre chair on which Oaklands's legs mainly rested; so suddenly as nearly to throw them to the ground, a catastrophe which was finally consummated by Lawless giving the other chair a push with his foot, so that it was only by great exertion and quickness that Oaklands was able to save himself from falling.

This was going too far; forbearance merely human could endure no longer: Lawless had obtained his object of disturbing Harry Oaklands's self-possession, and was now to learn the consequences of his success. With a bound like that of an infuriated tiger, Oaklands leaped upon his feet, and dashing Mullins into a corner with such force that he remained lying exactly where he fell, he sprang upon Lawless, seized him by the collar of his coat, and, after a short but severe struggle, dragged him to the window, which was about eight feet from the ground, threw it open, and, taking him in his arms with as much ease as if he had been a child, flung him out. He then returned to the corner, in which, paralyzed with fear, Mullins was still crouching, drew him to the spot from whence he had removed the chair, placed him there upon his hands and knees, and saying, in a stern voice, "If you dare to move till I tell you, I'll throw you out of window too," quietly resumed his former position, with his legs resting upon Mullins's back, instead of a chair.

As soon as Coleman and I had in some degree recovered from our surprise and consternation (for the anger of Oaklands once roused was a tremendous thing to behold) we ran to the other window, just in time to see Lawless, who had regained his feet, turn round and shake his fist at Oaklands (who merely smiled), ere he rang the bell in order to gain admittance. A minute afterwards we heard him stride up stairs, enter his bedroom, and close the door with a most sonorous bang. Affairs remained in this position nearly a quarter of an hour, no one feeling inclined to be the first to speak. At length the silence was broken by Oaklands, who, addressing himself to Cumberland, said, "I am afraid this absurd piece of business has completely marred the harmony of the evening. Get up, Mr. Mullins," he

continued, removing his legs and assisting him to rise; "I hope I did not hurt you just now." In reply to this, Mullins grumbled out something intended as a negative, and shambling across the room, placed himself in a corner, as far as possible from Oaklands, where he sat rubbing his knees, the very image of sulkiness and terror. Cumberland, who had appeared during the whole course of the affair absorbed in a book, though, in fact, not a single word or look had escaped him, now came forward, and apologised in a quiet gentlemanly manner (which, when he was inclined, no one could assume with greater success) for Lawless's impertinence, which had only, he said, met with its proper reward. "You must excuse me, Mr. Cumberland, if I cannot agree with you," replied Oaklands; "since I have had time to cool a little I see the matter in quite a different light. Mr. Lawless was perfectly right; the carelessness of my manner must naturally have seemed as if I were purposely giving myself airs, but I can assure you such was not the case." Here he paused for a moment, and then continued, with a half-embarrassed smile, "The fact is, I am afraid that I have been spoiled at home: my mother died when I was a little child, and my dear father having nobody else to care about, thinks, I believe, that there is no one in the world equal to me, and that nothing is too good for me. Of course all our servants and people have taken their tone from him, so that I have never had any one to say to me, 'Nay,' and am therefore not at all used to the sort of thing. I hope I do not often lose my temper as I have done this evening, but really Mr. Lawless appears quite an adept in the art of ingeniously tormenting." "I am afraid you must have found so much exertion very fatiguing," observed Coleman, politely. "A fair hit, Mr. Coleman," replied Oaklands, laughing. "No! those are not the things that tire me, somehow; but in general I am very easily knocked up—I am indeed—most things are so much trouble, and I hate trouble; I suppose it is that I am not strong." "Wretchedly weak, I should say," rejoined Coleman—"it struck me that you were so just now, when you chucked Lawless out of the window like a cat." "Be quiet, Freddy," said Cumberland, reprovingly. "Nay, don't stop him," said Oaklands; "I delight in a joke beyond measure, when I have not the trouble of making it myself. But about this Mr. Lawless, I am exceedingly sorry that I handled him so roughly; would you mind going to tell him so, Mr. Cumberland, and explaining that I did not mean anything offensive by my manner?" "Exactly, I'll make him understand the whole affair, and bring him down with me in five minutes," said Cumberland, leaving the room as he spoke.

"What makes Cumberland so good-natured and agreeable to-night?" whispered I to Coleman. "Can't you tell?" was the reply. "Don't you see that Oaklands is a regular top-sawyer, a fish worth catching; and that by doing this, Cumberland places him under an obligation at first starting? Not a bad move to begin with, eh? besides, if a regular quarrel between Lawless and Oaklands were to ensue, Cumberland would have to take one side or the other; and it would not exactly suit him to break with Lawless, he knows too much about him; and more than that, (added he, stifling his voice,) he owes him money, more than I should like to owe any body, a precious deal. I can tell you,—now do you *twig*?" "Yes," said I, "I comprehend a little more about it, if that is what you mean by '*twigging*;' but how shocking it all is! why, Cumberland is quite a swindler,—gambling, borrowing money he can't pay, and"—"Hush," interrupted Coleman, "here they come." Coleman was not mistaken: Cumberland had been successful in his embassy, and now entered the room, accompanied by Lawless, who looked rather crest-fallen, somewhat angry, and particularly embarrassed and uncomfortable, which, as Coleman whispered to me, was not to be wondered at, considering how thoroughly he had been *put out* just before. Oaklands, however, appeared to see nothing of all this; but, rising

from his seat, as they entered, he approached Lawless, saying, "This has been a foolish piece of business, Mr. Lawless; I freely own that I am thoroughly ashamed of the part I have taken in it, and can only apologize for the intemperate manner in which I behaved." The frank courtesy with which he said this was so irresistible, that Lawless was completely overcome, and, probably for the first time in his life, felt himself thoroughly in the wrong. Seizing Oaklands's hand, therefore, and shaking it heartily, he replied, "I tell you what it is, Oaklands, (we don't Mr. each other here,) you are a right good fellow, and no mistake; and, as to your shoving me out of window, you served me quite right for my abominable impertinence. I only wonder you did not do it ten minutes sooner, that's all; but you really ought to be careful what you do with those arms of yours; I was like a child in your grasp; you are as strong as a steam engine." "I can assure you, I am not," replied Oaklands, "they never let me do anything at home, for fear I should knock myself up." "You are more likely to knock other people down, I should say," rejoined Lawless, "and, by the way, that reminds me—Mullins! come here, stupid, and beg Mr. Oaklands' pardon, and thank him for knocking you down." A sulky, half-muttered "shan't," was the only reply. "Nay, I don't want anything of that kind, I don't, indeed, Lawless, pray leave him alone," cried Oaklands, eagerly. But Lawless was not so easily quieted, and Oaklands, unwilling to risk the harmony so newly established between them, did not choose to interfere further; so Mullins was dragged across the room by the ears, and was forced by Lawless, who stood over him with the poker, (which he informed him he was destined to eat red hot if he became restive,) to make Oaklands a long and formal apology, with a short form of thanksgiving appended, for the kindness and condescension he had evinced, in knocking him down so nicely, of all of which he delivered himself with a very bad grace indeed. "And all went merry as a marriage-bell," until we were summoned to the drawing-room, where we were regaled with weak tea, thin bread and butter, and small conversation till ten o'clock, when Mrs. Mildman proceeded to read prayers, which, being a duty she was little accustomed to, and which consequently rendered her extremely nervous, she did not accomplish without having twice called King William, George, and suppressed our gracious Queen Adelaide altogether.

PIERRE PITOIS.

In the year 1809, Pierre Pitois was sergeant in the twelfth regiment of the line, then quartered in Strasburg. He was a native of that half-savage, half-civilized, part of Burgundy known under the name of Morvan; and his comrades never spoke of him but as "a tough customer." Always the first and the last to fire, he had the reputation of liking but two things in the world—the smell of powder, and the whistling of bullets.

Now, one fine day, our friend Pierre took it into his head to address a letter to his Colonel, in which he applied for leave of absence to go and see his aged mother, who was dangerously ill. He added that his father, being seventy-eight years of age, and suffering under a paralytic affection, could not be of any use in nurse-tending the poor woman; and he pledged himself to return so soon as the health of his mother should be restored.

The Colonel's reply to Pierre's application was, "that, as the regiment might at any moment be ordered to take the field, no leave of absence could be obtained."

Pierre Pitois submitted. A fortnight elapsed; a second letter was received by the Colonel, in which

Pierre informed him that his mother had died without the consolation of giving her last blessing to her only child, and in which he again solicited leave of absence, saying, that "he could not state his reasons for this request—it was a family secret,"—but earnestly imploring his Colonel not to deny him this favour.

Pierre's second letter was as little successful as the first. The poor fellow's captain merely said, "Pierre, the Colonel has received your letter; he is sorry for the death of your old mother, but he cannot grant the leave of absence you require, as the regiment leaves Strasburg to-morrow."

"Ah! The regiment leaves Strasburg; and for what place, may I ask you?" said Pitois.

"For Austria," replied his officer. "We are to see Vienna, my brave Pitois;—we are to fight the Austrians. Is not that good news for you?—You will be in your element, my fine fellow!"

Pierre Pitois made no reply; he seemed lost in deep thought. The Captain caught his hand, and shaking it heartily, said—

"Why do you not speak, man? Are you deaf to-day? I am telling you that in less than a week you are to have the pleasure of a set-to with the Austrians, and you have not one word of thanks for the good news!—Nay, I verily believe you have not even heard me."

"Indeed, Captain, I have heard every word, and I thank you with all my heart for your news, which I consider very good news."

"I thought you would," said his officer.

"But, Captain, is there no chance of obtaining the leave of absence?"

"Are you mad?" was the reply. "Leave of absence?—the very day before taking the field!"

"I never thought of that," said Pierre. "We are then on the point of taking the field; and at such a time, I suppose, leave is never given?"

"It is never even asked."

"It is quite right—it is never even asked.—It would have the appearance of cowardice.—Well, then, I will not press it any more; I will try and get on without it."

"And you will do well," replied the Captain.

The next day, the twelfth regiment entered Germany; and the next—Pierre Pitois deserted.

Three months after, when the twelfth regiment, having reaped in the field of battle an abundant harvest of glory, was making its triumphant entry into Strasburg, Pierre Pitois was ignominiously dragged back to his corps by a brigade of the *gens d'armes*. A court-martial is immediately called. Pierre Pitois is accused of having deserted at the very moment when his regiment was about to meet the enemy face to face. The court presented a singular spectacle. On the one side stood forth the accuser, who cried,—

"Pierre Pitois, you, one of the bravest men in the army, you, on whose breast the star of honour yet glitters, you, who have never incurred either punishment or even censure from your officers, you could not have quitted your regiment—quitted it almost on the eve of battle—without some powerful motive to impel you! This motive the court demands of you; for it would gladly have it in its power—if not to acquit you, which it ought not perhaps either to do or to desire—at least to recommend you to the Emperor's mercy."

On the other side stood the accused, who answered, "I have deserted without any reason, without any motive; I do not repent: if it were to do again, I would do it again—I deserve death . . . pass sentence."

And then came some witnesses, who deposed,— "Pierre Pitois is a deserter, we know it is a fact, but we do not believe it." And others averred, "Pierre Pitois is mad; the court cannot condemn a madman.—He must

be sentenced then, not to death, but to the Lunatic Asylum."

This last alternative had very nearly been adopted, for there was not one person in the court who did not consider the desertion of Pierre Pitois as one of those singular occurrences beyond the range of human possibilities, which, while every one is forced to admit as a fact, no one can account for, or comprehend. The accused, however, pleaded guilty most positively, and was most pertinacious in his demand for the just penalty of the law to be inflicted upon him. He so boldly and fearlessly avowed his crime, continually repeating that he did not regret it, that at length his firmness assumed the character of bravado, and left no room for clemency. Sentence of death was therefore pronounced.

Pierre Pitois heard his sentence read with the most steady unflinching gaze. They warmly urged him to plead for mercy, but he refused. As every one guessed that at the bottom of this affair there was some strange mystery, it was determined that the execution of Pierre should be delayed. He was carried back to the military prison, and it was announced to him, that, as a mark of special favour, he had three days given him to press for pardon. He shrugged his shoulders and made no reply.

In the middle of that night on which was to dawn the day fixed for his execution, the door of Pierre's dungeon turned softly on its hinges, and a subaltern officer advanced to the side of the camp-bed in which the condemned was tranquilly sleeping; and, after gazing on him some time in silence, awoke him.

Pierre opened his eyes, and staring about him, said—

"The hour, then, is at last come?"

"No, Pierre," replied the officer; "it is not yet the hour, but it will soon come."

"And what do you want with me until then?"

"Dost thou not know me, Pierre?—No matter;—I know thee well. I saw thee at Austerlitz, and bravely didst thou bear thyself. From that day, Pierre, I have had for thee a regard no less warm than sincere. Yesterday, on my arrival at Strasburg, I learned thy crime and thy condemnation. I have prevailed on the gaoler, who is a relation of mine, to allow me to see thee; and now that I have come, I would say to thee, Pierre, it is often a sad thought to a man about to die, that he has not a friend near him to whom he might open his heart, and intrust with some sacred commission to discharge when he should be no more. If thou wilt accept me, I would be to thee that friend."

"I thank you, comrade," replied Pierre, briefly and coldly.

"Why! hast thou nothing to say to me?"

"Nothing."

"What! not one word of adieu to thy sweetheart, to thy sister?"

"A sweetheart?—a sister? I never had either."

"To thy father?"

"He is no more. Two months ago he died in my arms."

"Thy mother, then?"

"My mother!"—and Pierre, whose voice suddenly and totally changed, repeated,— "my mother!—Ah, comrade, do not utter that name; for see, how I have never heard that name—I have never said it in my heart without feeling melted like a child,—and even now, methinks, if I were to speak of her—"

"What then?"

"The tears would come—and tears do not become a man . . . Tears!" continued he, "tears when I have but a few hours to live—ah! there would not be much courage in that!"

"Thou art too stern, comrade. I think I have, thank God, as much courage as other people; and yet I should not be ashamed of weeping, if I were to speak of my mother."

"Are you serious?" said Pierre, eagerly seizing the officer's hand.— "You, a man and a soldier, and not ashamed to weep?"

"When speaking of my mother? Certainly not. My mother is so good, so kind; she loves me so much, and I, too, love her dearly."

"She loves you? and you love her?—Oh! then I may, indeed, tell you all. My heart is full; it must have vent, and, however strange my feelings may appear to you, I am sure you will not laugh at them. Listen, then, for what you said just now is quite true. A man is glad, when about to die, to have a heart to which he can pour out his own. Will you really listen to me, and not laugh at me?"

"Surely I will listen, Pierre,—a dying man must ever excite compassionate sympathy."

"You must know that, since I came into the world, I never loved but one being—that being was my mother. —But her I loved as none love—with all that was in me of life and energy. While yet a babe, I used to read her eyes, as she read mine; I guessed her thoughts, and she knew mine. She was the heart of my heart, and I the heart of hers. I have never had either sweetheart or wife; I never had a friend: my mother was every thing to me. Well, I was summoned to take arms, and when they told me I must leave her, in a paroxysm of despair I declared that they might drag me limb from limb, but never should they take me from her alive. With one word spoken in her holy fortitude and strong courage, she changed my whole purpose. 'Pierre,' said she, 'you must go—it is my wish.'—I knelt before her, and I said, 'I will go, mother.'— 'Pierre,' she added, 'thou hast been a good son, and I thank God for it; but the duties of a son are not the only ones a man has to fulfil. Every citizen owes himself to his country;—it calls thee,—obey! Thou art going to be a soldier; from this moment thy life is no longer thine own, it is thy country's. If its interests demand it, lay it down cheerfully. If it be the will of God that thou shouldst die before me, I should weep for thee my heart's tears, but I would say—'He gave, and He has taken away, blessed be the name of the Lord!' Go now, and if thou love thy mother, do thy duty.' Oh how precious those holy words! I have never forgotten them. 'Do thy duty,' she had said: now the duty of a soldier was always and in all things to obey; and in all things, and always, I obeyed. It was to go straight forward, to face danger without hesitation—without a second thought; and I went straight forward, faced danger without hesitation, without a second thought. Those who saw me thus, as it were, seek to meet the bullets, said, 'There is a brave fellow!' They might have better said, 'There is a man who loves his mother!'"

"One day a letter brought the tidings that she was ill—my own poor mother; I longed to go to her. I asked for leave of absense; it was not granted. I remembered her last words—'If thou love thy mother, do thy duty.' I submitted. A little after I heard that she was dead. Oh! then my senses forsook me: at any risk I determined to return to the country. Whence proceeded so ardent, so impetuous a desire to see once more the place where my mother had just died? I will tell you; and as you have a mother, as she loves you, and as you love her, you will understand me. . . ."

"We peasants of Morvan are a simple and confiding race; we have not received the instruction, nor attained the knowledge, that they have in the cities; but we have our beliefs, which the towns-folk call our superstitions. What matters the name? Be they superstitions or beliefs, we have them, and clever would be the man that could uproot them. Now one of these beliefs to which we cling the most, is that which attributes to the first flower that blows in the grave-mould such a virtue, that he who gathers it is certain of never forgetting the dead, and of never being forgotten by them. Belief, how dear! how sweet! With it death has no terrors; for death, without forgetting, or being forgotten, is but a sweet sleep, but calm repose after long toil. That flower—I panted to see it bud; I panted to gather it; I abandoned my post and went on my way. After ten

days of a long and weary march, I reached my mother's grave. The earth seemed yet fresh; no flower had appeared: I waited. Six weeks elapsed; and then one lovely morning I saw a little blue flower—"Forget-me-not." As I plucked it, I shed glad tears, for methought that little flower was my mother's soul; that she had felt that I was near, and under the form of that flower had given herself to my heart once more.

"There was nothing now to detain me in the country, for my father had soon followed my mother to the grave, and I had plucked my precious flower: what more did I want? I remembered my mother's charge—do thy duty! I sought out the *gens d'armes*, and I said, 'I am a deserter, arrest me.' . . . And now I am to die, and if, as you have assured me, I have in you a friend, I die without regret, for you will do for me the only service I require. The flower which at the risk of my life I plucked from the grave is here, in a little case next to my heart. Promise me that you will see that they do not take it from me. It is the link which unites me to my mother, and if I thought it would be broken—Oh! I should not have the courage to die. . . . Say, do you promise to do what I ask of you?"

"I promise," said the officer.

"Your hand, that I may press it to my heart; you are very kind to me; and if the Almighty God were in his omnipotence to give me my life a second time, I would devote it to you."

The friends parted.

The next day dawned. They had arrived at the place of execution; and already had the fatal sentence been read, when the low murmurs which ran through the ranks, suddenly changed into almost deafening shouts, "The Emperor! The Emperor! Long live the Emperor!"

He appeared, dismounted from his horse; then with his short quick step he walked up to the condemned. "Pierre," said he to him. Pierre gazed at him, and made an effort to speak, but a sudden stupor seemed to overwhelm him. "Pierre," continued the emperor; "remember your own words of last night. God gives thee life a second time; devote it not to me, but to France! She too is a kind and a good mother! Love her as thou didst love thy first—thine own." He then turned to depart, and greeting shouts of admiring love followed him till he was out of sight.

Some years after this, a captain of the Old Guards fell mortally wounded on the field of Waterloo.

Amid the din of battle, he was heard to shout in his death pangs—

"Long live the Emperor! France for ever! My mother! My mother!"

It was Pierre Pitois!

POPULAR YEAR-BOOK.

May 25.—St. Urban's Day.

An old author states, that "upon St. Urban's Day all the vintners and masters of vineyards set a table either in the market-stand, or in some other open or public place, and covering it with fine drapery, and strewing upon it green leaves and sweet flowers, do place upon the table the image of that holy bishop; and then, if the day be clear or fair, they crown the image with great store of wine; but if the weather prove rugged and rainy, they cast filth, mire, and puddle water upon it; persuading themselves that, if that day be fair and calm, their grapes, which then begin to flourish, will prove good that year; but if it be stormy and tempestuous, they shall have a bad vintage." Brand says that "it is customary, in many parts of Germany, to drag the image of St. Urban to the river, if on the day of his feast it happens to be foul weather."

May 29.—Royal Oak Day.

On this day, the anniversary of the Restoration of Charles II., it is still a practice, especially in the north of England, for the common people to wear in their hats the leaves of the oak, which are sometimes covered on the occasion with leaf-gold. This is done in commemoration of the marvellous escape of that monarch from those who were in pursuit of him, who passed under the very oak-tree in which he and Colonel Carlos had secreted themselves after the decisive battle of Worcester. Brand observes, "I remember the boys at Newcastle-upon-Tyne had formerly a taunting rhyme on this occasion, with which they used to insult such persons as they met on this day, who had not oak-leaves in their hats:

'Royal oak
The Whigs to provoke.'

"There was a retort courteous by others, who contemptuously wore plane-tree leaves, which is of the same homely sort of stuff:

'Plane-tree leaves;
The Church-folk are thieves.'"

It was usual, some years back, to decorate the monument of Richard Penderell (in the churchyard of St. Giles in the fields, London), with oak-branches, on the 29th of May. It was also customary on this day to ornament the statue of Charles II., in the old Royal Exchange, in a similar manner. At Tiverton, Devon, on this anniversary, a number of young men, dressed in the style of the seventeenth century, and armed with swords, parade the streets, and gather contributions from the inhabitants. At the head of the procession walks a man, called "Oliver," dressed in black, with his face and hands smeared over with soot and grease, and his body bound by a strong cord, the end of which is held by one of the men, to prevent his running too far. After these come another troop, dressed in the same style, each man bearing a large branch of oak: four others, carrying a kind of throne, made of oaken boughs, on which a child is seated, bring up the rear. A great deal of merriment is excited among the boys, at the pranks of Master "Oliver," who capers about in a most ludicrous manner. Some of them amuse themselves by casting dirt, whilst others, more mischievously inclined, throw stones at him; but woe betide the young urchin who is caught; his face assumes a most awful appearance from the soot and grease with which "Oliver" begrimes it, whilst his companions, who have been lucky enough to escape his clutches, testify their pleasure by loud shouts and acclamations. In the evening, the whole party have a feast, the expenses of which are defrayed by the collection made in the morning. A correspondent in Hone's "Year-Book" states, that at Exeter the 29th of May has acquired the cognomen of "Lawless day," a name every way appropriate to the proceedings upon its celebration in that city. Early in the morning, he says, the bells at the various churches ring merry peals, and "squads" of the mischief-loving part of the mobility, with large bludgeons, haste to different stations which they have previously selected for the scene of operations. The stations are soon, but not always peaceably, occupied; for it frequently happens that two parties have chosen the same spot, and the right of possession is decided by violent and obstinate contests. As the day advances, and these preliminaries are adjusted, by the weak giving place to the strong, the regular business commences. The stoutest and most resolute remain to guard the stations, while the rest are detached, and busily employed in collecting mud, stones, brickbats, old mats, hay, straw, and other materials suitable to the purpose of forming dams across the kennels, for stopping the water. These pools are sometimes as much as two feet deep, and are called bays. If the water does not accumulate fast enough in these bays, the deficiency is supplied by parties, who fetch it from various parts, in all kinds of vessels, and, when

they can get nothing better, in their hits. At each bay, one of the party, belonging to it is stationed to receive donations from passengers. If a gift be refused, he makes a signal, by whistling, to his companions, and they directly commence splashing and bedabbling, most lustily, and render it impossible for any one to pass by without a thorough drenching; but if a trifle, however small, is bestowed, the donor is allowed safe conduct, and three cheers for his liberality. Persons sometimes throw a few halfpence into the water, and become bystanders, to enjoy the sight of the snatching, raking, tumbling, and rolling of the poor fellows, in their endeavours to find the money, which, as fast as it is got, is mostly spent at the nearest public-house. The effect of the liquor is soon perceived in the conduct of the various parties; and it mostly happens that the interference of the headles and constables is absolutely necessary. Upon "Lawless day" the rabble frequently drag out the parish engines, and play them upon any on whom it is presumed the trick can be practised with impunity. This has been done even in the principal streets. Towards the close of the day the stations are gradually deserted, one after the other, and the groups who occupied them, and have not spent all the money they collected, go to the public-houses and drink it out. In the meantime, the vacant places in the streets are eagerly taken possession of by ragged children, who imitate the rough pastime of their elders.

May 31.—Whit Sunday, (1846.)

This festival was very early established by the Church in commemoration of the day of Pentecost. "It is called Whit Sunday," says Bishop Sparrow, "from the glorious light of Heaven which was then sent down upon the earth, from the Father of lights; as also because the new baptized, which were many at that feast, (Whit Sunday and Easter being the two solemn times of baptism,) were then clothed in white garments, as types both of that spiritual whiteness and purity of soul which they received in baptism, as also of their joy for being then made by baptism members of CHRIST, children of God, and heirs of the kingdom of Heaven."

RELIGIOUS OBSERVANCES.

Fosbroke relates that, in some churches abroad, unconsecrated wafers, preceded by water, with oak leaves, burning tow or torches, were thrown down from the church roof; and small birds, with cakes tied to their legs, let loose during the celebration of Divine service on Whit Sunday. Lambarde, in a book written *circa* 1570, says, "I myself, being then a child, once saw in Paul's church, in London, a feast of Whitsuntide, where the coming down of the HOLY GHOST was set forth by a white pigeon, that was let to fly out of a hole, that yet is to be seen in the midst of the roof of the great aisle; and by a long censer, which, descending out of the same place, almost to the very ground, was swung up and down at such a length, that it reached, with the one sweep, almost to the west gate of the church, and with the other, to the quire stairs of the same, breathing out over the whole church and company a most pleasant perfume of such sweet things as burned therein." Our forefathers, on this festival, decorated the churches with garlands, &c., as at Easter,—an ancient and beautiful custom, which is still observed in many parts of England.

An idea appears formerly to have prevailed in this country, that "whatsoever one did ask of God upon Whit Sunday morning, at the instant when the sun arose, God would grant it him." It has been suggested that this notion not improbably took its rise from the doctrine of the HOLY SPIRIT'S influence to render prayer effectual.

Palm Leaves.

THE DESERT ISLAND.

A RICH charitable man, being desirous to make one of his slaves happy, bestowed upon him freedom, and also a ship freighted with all kinds of costly wares. "Go," said he, "and sail to a foreign country, where you can trade with these goods; and the profit shall be your own."

The slave set off on his voyage; but he had not been long upon the sea, when a violent storm arose, and his ship was cast against a rock and wrecked. His precious wares sank in the deep, all his companions were lost, and he alone escaped with great difficulty, and contrived to reach the shore of an island. Hungry, naked, and helpless, he wandered farther inland, and was weeping over his misfortunes, when he observed in the distance a large town, whence a number of inhabitants came towards him, and with loud shouts of joy, hailed him as their king. Then surrounding him with cries of welcome, they placed him in a splendid car, and led him to the town. Arrived at the Royal Palace, they clothed him in a purple mantle, bound a diadem on his brow, and mounted him upon a golden throne. The nobles approached, knelt before him, and swore allegiance in the name of the whole people. The new king, at first, believed all this splendour to be a wondrous dream; until the continuance of his good fortune no longer left any doubt, that these extraordinary occurrences were in truth realities. I cannot understand, said he to himself, what has bewitched the eyes of this people, and induced them to make a forlorn stranger their king. They know not who I am, they ask not whence I came, but place me at once on their throne. This must be a strange country indeed, since such a custom prevails in it.

Thus he reflected, and became so curious to know the cause of his elevation, that he determined to ask one of the nobles of his court, who appeared a clever man, to solve the riddle for him. "Tell me, vizier," said he, "why have you made me your king? How could you know of my arrival on your island; and what will be the end of all this?"

"Sire," answered the vizier, "this island is called the Island of Probation, and is inhabited by beings of a peculiar order. In times gone by, they asked the Almighty to send them every year a son of Adam to reign over them. The Almighty has accepted their prayer; and every year, at the same time, He causes a man to land upon their island. The inhabitants hasten joyfully to meet him, as you have seen, and acknowledge him for their ruler, but his government lasts only one year. When that period has elapsed, and when the appointed day comes round, he is deprived of all his authority. His royal attire is taken from him, and he again puts on his mean clothing. His servants forcibly carry him to the shore and place him in a ship, built expressly for the purpose, which bears him on to another island. This island is a desert waste: he who was some days before a mighty king, arrives there ragged and alone, and finds neither subjects nor friends. There is no one to participate in his misfortune; and if he has not turned his year to the best account, he will have to pass a sorrowful and melancholy life in this desert land. After the banishment of the old king, the people go forth to meet the new one, whom

the providence of the Almighty sends, in the usual manner, every year without exception, and they receive him with the same pleasure as the preceding ones. Such, Sire, is the immutable law of this kingdom, which no sovereign can change during his reign."

"And were all my predecessors," pursued the King, "made acquainted with the short duration of their power?"

"To none of them," answered the Vizier, "was this law of mutability unknown; but some allowed themselves to be dazzled by the brightness which surrounded their throne; they forgot their sorrowful future in the joyful present, and passed their year without acquiring wisdom. Others, intoxicated by the sweetness of their fortune, did not dare to reflect upon the end of their reign, and the ensuing abode on the desert island, lest it should have embittered their present enjoyment; and thus they staggered, like drunkards, from one pleasure to another, until their allotted time was fled, and they were cast into the vessel. When that unhappy day arrived they all began to lament and bemoan their blindness; but it was too late; they were relentlessly given over to the misery which awaited them, and from which they had not taken thought to defend themselves."

This narrative of the Vizier filled the King with alarm; he trembled at the fate of former monarchs, and earnestly wished to escape their fall. He saw with horror that some weeks of his short year were already gone, and that he must hasten to employ the remaining days better, and endeavour to atone for those already wasted. "Wise Vizier," he replied, "you have discovered to me my future lot and the short duration of my royal state. Tell me also, I pray you, what I must do to escape the misery of my predecessors?"

"Bear in mind, Sire," answered the Vizier, "that you came naked to this island, for thus you will depart from it, never more to return. There is, therefore, only one way of preventing the want with which your banishment threatens you; that is, to cultivate the island, and fill it with inhabitants. This our laws allow you to do; and your subjects are so perfectly obedient, that they will go wherever you desire. Send, therefore, a number of labourers over to the desert land, and let the waste grounds be converted into fruitful meadows; erect towns and storehouses, and provide them with all necessary means of existence. In one word—prepare for yourself a new kingdom, whose inhabitants, after your banishment, will receive you joyfully. Be vigilant, let not a moment pass unemployed; for the time is short, and the more you do towards the erection of your new dwelling, the happier will be your abode there. Constantly figure to yourself that to-morrow your year will be already passed, and take advantage of to-day's freedom, like a fugitive, who knows that chains await him on the morrow. If you despise my counsel and give way to procrastination and idleness, you are lost, and eternal misery will be your lot."

The King was a sensible man, and the speech of the minister gave wings to his decision. He at once sent off a number of his subjects, who went willingly and commenced the work with zeal. The island soon began to improve, and before six months had passed, there stood fair cities on its blooming plains. But the King was yet unsatisfied. He

sent over other inhabitants, and they were even more willing than the first, because they went to a pleasant land, inhabited by their friends and countrymen. In the meantime the year was drawing to a close. Former kings had trembled at the approach of the moment in which they were to lay aside their transient honours; but this one looked forward to it with eagerness, for he was bound to a land where, by his well-directed exertions, he had prepared an enduring habitation. The appointed day at last arrived. The King was seized in his palace, despoiled of his diadem and royal attire, and placed in the fatal vessel which was to bear him to his place of banishment. But hardly had he landed on the coast of the island than the inhabitants hastened joyfully to meet him, received him with great honour, and, instead of decking his head with a diadem, whose splendour lasted but one short year, bound a wreath of unfading flowers around his brow. The Almighty rewarded his wisdom. He gave him the immortality of his subjects, and made him their eternal King.

The rich, beneficent man is God; the slave who is sent forth by his master, is man at his birth. The island where he lands, is the world; the inhabitants who receive him gladly, are the parents who provide for the naked, weeping stranger. The Vizier, who warns him of the sorrowful fate which awaits him, is Wisdom. The year of his reign, is the course of human life; and the desert island for which he is destined, is the future world. The labourers whom he sends there, are the good works he does during his life. But the Kings who preceded him, and did not consider the misery that awaited them, are the larger portion of mankind, who are occupied only with earthly pleasures and occupations, and do not remember the life which follows after death—they were punished with want and misery, whilst the other appeared with full hands before the throne of the Almighty.

WOODSIDE CHEQUERS.¹

Nor to know "Woodside Chequers,"—its comely landlord and his pretty daughter, its magnificent old walnut-tree and velvet bowling-green, its pleasant orchard and its lawny cricket-ground,—would imply a degree of ignorance perfectly unpardonable in any inhabitant of any village lying within a reasonable distance of our own. We, too, should be wanting in our duty as faithful chroniclers of village history, were we to neglect to introduce the reader to both host and hostelry.

It was a shrewd thought of the original founder of the "Chequers," to build it on its present site,—just at the confluence of the only lanes which can aspire to something like the dignity of roads: for, in the hot and arid summer time, he must be a resolute and self-denying traveller, who can steadily pass it by, nor turn aside to rest himself and horse beneath the cool soft shadow of the branchy walnut-tree before the door: and in the cold and gusty evenings of the gloomy winter, there is a sore temptation to the numb and weary wayfarer, in the broad red glow of wavering light which streams from every lower window of the inn, and sheds a ruddy glare upon the miry road. Other, and manifold attractions are there, for those who make the "Chequers" their habitual resort; the host himself—not certainly the least—to village elders a boon companion, and to all a

(1) From "Fond Rural Records, or Glimpses of Village Life, by James Smith."

mirth-provoking humorist; while his daughter, Lucy, an arch and winning Hebe, the "cynosure of neighbouring eyes," despotically sways the hearts of half the Woodside bachelors. No wonder they extol her father's "old October," and proclaim his home-grown cider to be a peerless beverage; and no wonder that she hath as many suitors as Penelope, who consume, like those at Ithaca, her father's substance; but, unlike those, perpetually enrich the exchequer of their host.

Stephen Mavis!—the very name seems most peculiarly befitting one whose ripe round voice can make the rafters ring again with echoes of old glees and catches, that have cheered the heart of many a generation gone. Stephen Mavis! that little oily obese man, whose grey eyes twinkle with the quiet humour which is perpetually working at the corners of his mouth, and dropping in quaint and sententious speeches from his tongue; the warm, kind-hearted friend of every needy man, woman, and child in the parish; whose bountiful disposition is proverbial, whose very failing is, in fact, excessive credulity in cases of simulated distress; who in a fit of forgetfulness, (such was *his* version of the story) deterred the whole array of scores from off the bar-door, one bitter winter, when work and money equally were scarce;—what a lengthened, and withal a truthful eulogy, could we not write upon the character of the blithe, child-hearted host of "Woodside Chequers."

Deserted in his infancy,—one of the waifs and strays of humanity, left to the frigid charity and precarious benevolence of the world, the child Stephen was discovered by some school-boys, during the progress of a bird's-nesting foray, wrapped in an old bag-wig, deposited on a thymy path, not many paces distant from a public path, and sleeping soundly beneath the broad blue cope of heaven. Transferred to the parish work-house, the poor foundling in due time became the pauper scapegoat: but spare diet and rough usage, hard words and blows by day, and a miserable couch by night, neither impeded his growth nor embittered his temper; and, at the age of fourteen, the merry-hearted outcast made his first plunge into active life, in the capacity of odd-boy at the Croos-Brook Farm. Thence, mounting the ladder of promotion, he was inducted to the ostlership of the "Chequers;" and some years later, a thrift, and a concurrence of fortunate circumstances, were the means of elevating him to the dignity of landlord,—the *ultimatum* of his aspirations, the crowning glory of his difficult career. Nor, as we have intimated, has prosperity blunted the fine edge of those warm, generous feelings which nature gave him in requital, as it would seem, for man's neglect. He is the father, metaphorically speaking, of every orphan child within the range of his acquaintance; and as to foundlings! discreet and learned men would most assuredly pronounce his overflowing tenderness for them, rank monomania. For our own part, we are prone to the belief, that Stephen's heart is, after all, worth half-a-dozen such discreet and learned heads.

For long after Stephen's assumption of the style and title of "mine host," common consent concurred in dooming him to an irrevocable celibate. The maiden portion of the village *noblesse* (for your patrician aristocracy hath its plebeian counterpart), turned up their noses (with some it was a work of supererogation) at the man of doubtful parentage; and humbler folks—as humbler folks are very apt to do—submissively conformed to their example. Hence was the landlord of the "Chequers" doomed to be an *enfant perdu*,—a bachelor thrust violently without the matrimonial pale,—a mateless Adam, wandering in solitary sorrow round the confines of the marital paradise. Bless you! they were never more mistaken in their lives; for Stephen suddenly astounded the prophets, and falsified their prophecies, by wooing, winning, and wedding the most arrant shrew that ever trod in Katherine of Padua's steps. Swayed by the impulse of a most prevailing pity, moved by a sentiment of deep compassion,

or perhaps half-conscious that his own benevolence of disposition, tending to excess, needed a counterpoise, a balance, and a check, Stephen Mavis wrote himself husband, and, in due time, father.

In the dramas of an old-fashioned play-wright (one Will Shakspeare by name), we find it recorded, that Petruchio's mate was most effectually subdued and tamed; but Mistress Mavis, be it remarked, was perfectly untameable. Nor was the violence of her temper modified in the least degree by matrimony. Yet Stephen bore it all, with the equanimity of a philosopher, and the resignation of a martyr. Invective only elicited some expression of his dry, quaint humour; and when the domestic atmosphere was rife with storms, and resonant with feminine thunder, Stephen would coil himself up like a tortoise with the impenetrable shell of a happy indifference, and, with an inward chuckle, frame mentally shrewd aphorisms upon the failings of his ungently helpmate. Finally, the poor shrew grew weary of this idle expenditure of breath,—then hypochondriacal,—then sickened,—and then died! And this was Stephen's first and last venture in the matrimonial lottery.

To do him justice, the landlord of the "Chequers" sorrowed earnestly for his loss; though happily the childish prattle of his only child and daughter, Lucy, mitigated his regret.

Will it not be asked, if this same Lucy, whom nineteen summers have ripened into all the grace and beauty of a fabled wood-nymph, has inherited aught of the maternal taint? In truth, we must respond in the affirmative; but then, it is the slightest tint imaginable, and, heightening, as it does, the brilliancy of her sparkling eyes, lending vivacity to her movements, and imparting a sort of piquancy to her conversation, one can scarcely wish her spirit less, or her participation in the milder attributes of her father's character greater than it really is. Rivals and gossips add, that Lucy hath a potent and invincible self-will; but so had Beatrice; and yet, what cynic thinks of blaming Benedick's "dear Lady Disdain?" Like Beatrice, too, our village beauty is a very "*À la* in good apparel" to her suitors, albeit there are two who claim an enviable pre-eminence in her affection, or, to say the least of it, esteem—John Eleigh, the handsome bailiff, at the Warren Farm; and Robert Hothaom, a thriving village tradesman, with a snug freehold of his own, and a comfortable nest-egg in the—Savings Bank. But then, her smiles and sarcasms, her gentle speeches and her biting jests, her sunny glances and her stormy frowns, are apportioned so equally between the two, that we profess we are utterly incompetent to pronounce which is indeed the favourite. Mere accident, or perhaps caprice, will, we suspect, eventually decide the choice.

We laid our pen aside, and let a fortnight pass, nor do we now regret the pause; for, on a bright June morning, in the present year, when the sky was populous with soaring birds, and jubilant with happy song, and bright with cloudless sunshine, and the air was fragrant with the dewy scent of tardy orchard-blossoms, and the green earth still glistened with the beaded lustre of the last night's shower, and the luxuriant trees spread their broad leaves, as though they wooed the sunshine, and longed to dally with the breeze, and bees were humming round the garden-flowers, and insects weaving mazy dances in the sun, and martins circling the old church-tower in rapid rings—on such a morning, we repeat, traversing the green at an early hour, we saw that busy hands were fashioning an arch round the "Chequers" door; that the old stone cross, elsewhere alluded to, was dressed with flowers; and that a flag, a new and silken flag, was fluttering from its summit. What did it all import? The wake, we knew, was past, and what could these gay decorations mean? We put the question to Tom Branchley, the hostler of the inn, and his broad unmeaning features relaxed into a grin, as he replied, "Young missus a-going to have a master, sir." And

then the man chuckled again, as though he had uttered something supremely droll.

"And who may be the happy man?"

"Master Hotham," laconically responded he of the ample mouth.

Food for conjecture this! A most provoking stimulant to curiosity. What did it all import? How had the match been brought about? What had determined Lucy in the choice? Happily our wonderment was not destined to have a wearisome duration. An old man—no other than the parish clerk, bore down upon us with an evident determination to bring both himself and us to anchor. Bursting with the secret, the venerable functionary scarcely waited to be questioned before the whole history came trickling from his tongue.

It seemed that both the suitors of our village belle had grown impatient of delay, and from besieging Lucy, had diverted their assault to Stephen, bent upon baiting him into such an exercise of his paternal influence as should compel the coquette to a final and determined choice. Our host pondering upon the matter, and secretly making his own election of a son-in-law, bent all "his corporeal agents to the feat." With an intuitive perception of the *idiosyncrasy* of his daughter's mind, he chose a favourable opportunity to enlarge upon the subject of her settlement in life, dwelt on the character and prospects of her suitors, and with bitterness and vehemence aspersed and ridiculed the pretensions of Robert Hotham. The artifice succeeded to a miracle. Lucy first palliated, then defended, then battling for the libelled man, not merely championed his suit, but hurled a scornful negative at that of John Eleigh; and when, at the secret suggestion of our host, Robert Hotham visited the wayward beauty, and stoutly urged his suit, he won from her the promise of her hand, and Stephen gained his wished-for son-in-law. And they were married; and there was open-house at "Woodside Chequers," music and merry dancing on the green, Momus holding high festival without, and old Silenus—truth must be told—heading a band of tipsy revellers within; and, in the fulness of his heart, Stephen trolled forth his choicest songs, and broached his choicest ales, and in the choicest language he could command, toasted both bride and bridegroom in a choice old beaker of his choicest wine. Rare mirth! rare festival! rare revelry! a day marked with a white stone in the village calendar by all but the rejected wooer of the bride, who purposes, it is affirmed, to seek, in change of residence, forgetfulness of the pretty bar-maid of "Woodside Chequers."

DETACHED THOUGHTS;

FROM

JEAN PAUL RICHTER.

"Of differing themes the veering song was mixed."

A TRUE comforter must often take away from the mourner all ordinary topics of consolation, and lead him where only the highest can be of any avail.

A perpetual calm would hinder the fructification of flowers. Let this console us under suffering.

The involuntary sanctification in our minds of the dead—wherefore? whence? Not from a life-long absence merely; for then a voyage to America would produce it. It is rather the idea of the change in the departed, the putting off of his body,

his novel circumstances, his new relations, whence he looks down upon all here as earthly.

* Memory is the highest gift; we do not feel it to be so, because we only partially lose it, and generally retain it in great things; but let a man every moment forget others, and then see what he would be. We are the creatures of the past, therefore, of memory. To deprive us of memory, would be to thrust us naked, destitute, into the mere present, only the moment after to strip us of memory again.

A good action shines out upon us in the deceased—it is the precious stone which the Mexicans place amid the ashes of the dead, that it may represent the heart.

How does human love still pine after, still stretch forth its arms to clasp the fading images that still elude its grasp! It would make for itself an eternity out of the transitory and the perishing!

Were there not a lurking disbelief of immortality, there would be far more courage in death, more content in life, and less over-value for it.

There are persons who, endowed with a higher sense, but with weaker powers than active talent, receive in their soul the great world-spirit, whether in outward life, or in the inner life of fiction and of thought, who remain true and faithful to it, as the tender wife to the strong man, but who, when they would express their love, can only utter broken sounds, or speak otherwise than they wish. If the man of talent may be called the merry imitative ape of genius, these are the silent, serious, upright woodmen, to whom fate has denied the power of speech. If, as the Indians think, the animals are the dumb of the earth, these are the dumb of heaven.

The spirit is as invisible as its speech, but what does there not lie of all that is lofty, all that is life, in a single word? Is it lost when the air on which it has been wafted has passed away?

We speak of *life* being taken, when it is only *years* that are taken.

There is something so great in a single good action, that the man who, in his whole life, has performed even one, can never be wholly despicable.

It is our eyes, and not the microscope, that deceives us. It could not create or show what is not. The earth may be infinitely greater.

Let a man be ever so much upon his guard against a flatterer, there are still a few points at which he is accessible.

How many thousands of little means must a man have recourse to, before he can accomplish anything great!

We should sooner learn to know men if we did not regard every action as the result of a fixed principle. Caprice prevents their adherence to it; and, therefore, we ought not to draw any conclusion as to character from a single action.

A man, in the enjoyment of any pleasure, may have only a delight of the senses; but he who beholds that man's enjoyment with a sympathizing eye, has a heart-delight.

He who has about ten things a single original unhackneyed thought, has many such about a hundred things.

It is one of the contradictions in man's nature, his knowledge that he has these contradictions.

Fancy, or the creative power, is the world-soul of the soul, the element-spirit of the other powers. Experience, and the varied influences of the mind, tear but leaves from the book of nature. Fancy forms these parts into a whole. It brings even the absolute and the infinite nearer the reach of reason, and renders them more discernible to mortal man. It employs itself with the future and the past, because no other time can become infinite or totalised. Not from a room full of air, but from the whole height of the atmosphere, is the ethereal blue of heaven formed.

He who is not growing wiser has never been wise.

He who in his sphere, however circumscribed, perfects, as far as in him lies, all duty and all self-denial, not merely in doing, but in abstaining, needs for his growth in virtue no extraordinary circumstance, no unusual occasion; should such arrive, it finds his already grown.

He who has not courage enough to be a fool in his own way, will scarcely have sufficient to be wise in his own way.

How pensive we are made by a beautiful night—by lovely scenery—by the sound of music—by reflection on the infinite—by the shadowy-tinted cliffs of the future!

We should never mourn for one that dies at fifteen. There die the first dawns of love with the spring-flowers in its little heart. I would visit the grave of such an one in the spring, merely that I might be glad.

Spring passes away, and so must thou. Is thy cheek of roses fairer than the rose which must also fade? Thy song, other than that of the nightingale, which is also silenced? Lie down calmly in thy dust, thou human flower. That dust will yet be the pollen of a fairer one; and earth has no more that it can do to thy blossoming soul.

The greatest sorrow is the loss of the beloved by a death not preceded by illness, or, which is one and the same thing, by death taking place while at a distance from us.

In the case of illness, the gradual dying, the visible fading away of the cherished image before our eyes, slowly accustoms us to the thought of death—it is the soothing twilight preceding the night; whereas in the other case, the sun sets at once, without twilight. Yes, the greatest sorrow is the beholding the blooming countenance behind the pale ghastly face of death.

If everything here below happened as thou couldst wish, in every particular, even the most minute, and fulfilled the least, as well as the greatest of thy desires, thou wouldst gain nothing but the awakening of a greater desire, not to be gratified by anything earthly.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

A TRUE GHOST STORY.

DR. FOWLER, Bishop of Gloucester, in the early part of the eighteenth century, was a believer in apparitions. The following conversation of the bishop with Judge Powell is recorded:—

"Since I saw you," said the lawyer, "I have had ocular demonstration of the existence of nocturnal apparitions."

"I am glad you are become a convert to truth; but, do you say ocular demonstration? Let me know the particulars of the story."

"My lord, I will. It was—let me see—last Thursday night, between the hours of eleven and twelve, but nearer the latter than the former, as I lay sleeping in my bed, I was suddenly awakened by an uncommon noise, and heard something coming up stairs, and stalking directly towards my room. The door flying open, I drew back my curtain, and saw a faint glimmering light enter my chamber."

"Of a blue colour, no doubt?"

"The light was of a pale blue, my lord, and followed by a tall meagre personage, his locks hoary with age, and clothed in a long loose gown; a leathern girdle was about his loins, his beard thick and grizzly, a large fur cap on his head, and a long staff in his hand. Struck with astonishment, I remained for some time motionless and silent; the figure advanced, staring me full in the face; I then said, 'Whence and what art thou?'"

"What was the answer—tell me—what was the answer?"

"The following was the answer I received:—'I am watchman of the night, an't please your honour, and made bold to come up stairs to inform the family of their street-door being open, and that if it was not soon shut, they would probably be robbed before morning.'"

THERE are cases in which a man would be ashamed not to have been imposed on. There is a confidence necessary to human intercourse, and without which men are often more injured by their own suspicions, than they would be by the perfidy of others.—*Burke*.

THE works which continue to please from age to age, are written with perfect simplicity; while those which captivate the multitude, by a display of meretricious ornaments, if, by chance, they should survive the fashions to which they are accommodated, remain only to furnish a subject of ridicule to posterity.—*Stewart*.

HE censures God, who quarrels with the imperfections of man.—*Burke*.

MR. WAGHORN, in a letter just published, says—"Ere two years, I feel convinced that despatches will be in London on the 21st day from Bombay."

" And we have busy task to do
Old England's shores to clear
Of all the French and Flemish loons
That work our merchants fear
" The Percy is our admiral,
A seaman stout and true
The day his pennon was unfurled
The knaves shall dearly rue
Oh! weary men art we, fair sir
Oh! weary men are we
And wending home a weary way,
Over the summer sea,
" And we have toiled full many a day,
And watch'd full many a night
And strain'd our canvas in the chase,
And struggled in the fight
But glory smil' all our barque bears home
Small boot for all our pains,
Save true and loyal Cornish hearts,
Whom no dishonour stains
" Turn then with us brave mariners
Fortune will yet betide
For ye shall beir back fur renown
And gold and gear beside
" Ye speak in courteous guise fur a
But so it may not be
For aye upon our voy'ge there lingers
An evil destiny
But an by God his grace we w
To lay our living
Right duly shall our vows be
Before the holy rod
And ere this horned moon be full
If Heaven it so ordun,
With brighter fortune on our sails
We will to sea run
They parted there with promise fair
And words of kindly tone
He stately fleet like a king's
That little barque alone
A summer's day she scarce had sail'd
Upon the summer sea
When they were aware of a tall, tall ship
Just nearing on their lee
" Now Heaven us aid the captain said
Now Heaven us aid and save
An these be Flemish loons, I trow
Short shift our souls shall have
And now the pirate Flemishers
Have laid the barque on board
And fast and fell their deadly odds
Upon her deck have poured
And they have sl'n her struggling crew
Or bound them limb to limb,
And bore her sides with many a hole
That she no more may swim
And while the summer sun shone bright
And while the breeze blew free
A hundred gallant hearts went down
Into the summer sea
Blythe hearts are yours ye Flemishers
Ye share the spoil with glee —
Think ye the deep sea wave will hide
Your deed of villany?
The breeze is fair, steady and fair,
And ere the close of day
The blood-stain'd ship has gained the land
Within St Austle's bay

God's watchful eye can guilt espy,
Even on the lonely sea,
His glorious might full well requite
The deed of villany

And when the evening lights shone out
From the good town of Foye,
The chase is past, they meet them fast
With anchor and with buoy
They moor them fast in peaceful guise,
As merchants good and true
And where is he, the guilt shall see
Of that red handed crew?
Now when the red town lights grew dim
Across the midnight tide
A sailor boy leapt lightly down
From off the Fleming's side
And when he touched the salt sea wave
He settled himself to swim,
And when he gained the harbour beach,
He ran with heart and limb
Right onward through the town he sped
As fast as bolt can fly
Till he knocketh at the castle gate
Of good Sir John Trefry
" What cheer? what cheer? " the porter cried,
Who knocketh here so late?
What hasty tidings have ye brought
To my good master's gate?
" A stirring tale thou porter giv'
And a sad tale thereby,
Will bring the red blood to thy cheeks,
The tear drop to thine eye
He be false traitors in our port
He be traitors in our town
He hid the pirate's bloody kn
Beneath the merchant's gown
For our good barque the Tiger
The Flemishers have taken
And sunk her in the deep mid sea
The living with the slain
Borne back unseen amid the throng,
I gained their deck alone,
And Heaven their course hath hither led
And marked them for our own
" But they have sworn, before the moon
Fresh deeds of blood to do,
And we must up with heart and hand
Or ever their oath be true
Now by our Lady," quoth Sir John
An thou sayst truth to me
When thou art grown to man's estate
My captain shalt thou be
No beacon raised it's warning flame,
No alarm bell was rang,
Yet silent at the harbour beach
Fleete gather old and young
And silent at the harbour's mouth
They raise the ponderous chain
Ye castles! ye have crossed it once
Ye pass it not again
A hundred gallant men of Foye
Their captain good Sir John,
Straight to the treacherous merchantmen
Are stealing swiftly on
And hark! upon the night-wind borne,
A pealing shout there rose,
With all the din of mortal strife,
Wild shrieks and clanging blows
The summer sun came blithely up,
The birds their matins sung,
But cold and dead from his top mast head,
The pirate chieftain hung

THE DISCOVERY OF MADEIRA.

A PORTUGUESE CHRONICLE.

IN the early part of the fifteenth century, under the reign of Don Juan the First, the Portuguese, after having completely subdued the Moors, turned all their thoughts to voyages of discovery. There appeared almost simultaneously Gilianez, who doubled the formidable Cape Bajador; Cintra, who conquered the islands of Arguin; Juan Gonsalvo Zarco and Tristan Tessora, two courageous explorers of the African seas; Fernandez, the first who ventured to navigate the river Senegal; Megno, killed while fighting against the negroes of the Cape Verd Islands; and Gonsalvo Vello, who discovered the Azores. Never had such a number of celebrated navigators appeared at the same time in any one nation. The better to direct their maritime expeditions, the Infant Don Henry, third son of the king, had taken up his residence at the castle of Ternaubal upon the Cape Sagres, thirty-two leagues to the west of Lisbon, from which place he was able to see the Portuguese vessels sailing towards the destination which either he himself, or Don Juan his father, had marked out.

At the close of the month of January, 1421, in a miserable house in the suburbs of Sagres, three women were working in silence by the flickering light of a torch. The eldest, as she rose on hearing the neighbouring church-clock strike, said sadly,—

"It is exactly four years ago since Juan Moralez, your father, left us at this very hour to go to sea. We have long awaited his return, but his prolonged absence extinguishes all our hopes. He has doubtless perished, my children,—perished amid the waves, or on some distant shore, deprived of the consolations of his family and the rites of the church. If we have been unable to attend him in his last moments, let us pray, at least, for his eternal salvation."

The mother and daughters knelt down together, weeping bitterly, and recited the psalm, *Domine Deus, audi nunc orationem mortuorum Israel*.

Hardly had they finished the first verse, when the door was hastily thrown open, and a man advanced into the room. In spite of the white mantle, the hood of which fell over his forehead, and the untrimmed beard which concealed the lower part of his face, the three women thought they recognized Juan Moralez; but the night-wind, rushing through the door of the dwelling, extinguished the torch, and thus prevented them from more fully ascertaining the identity of the stranger.

"It is Juan's spirit come back to visit us," exclaimed the mother, seized with superstitious dread.

"No, Pepita," replied the new-comer; "I am no spirit; but your own husband, whom Providence has saved from shipwreck and captivity.—Light the torch, that I may see and embrace you all."

After the first effusion of joy, the eldest of the girls said to Juan,—

"We had lost all hope of seeing you again, dear father."

"Oh, yes!" added the second; "we wept for you as one lost to us in this world. We frequently seated ourselves on the sea-shore, as if questioning the immense ocean what had become of you, and supplicating heaven to restore you to our

prayers; and, when we returned in the evening, we returned with despair in our hearts."

"I was indeed near being taken from you, my children," replied Moralez. "I long believed that I should never be permitted to return to my family and my country. I have suffered much, but this night repays me for all."

"Where have you come from just now?" inquired Pepita.

"From the prisons of Morocco."

"You have been a prisoner, then?"

"But six days ago I was a slave to the unbelieving dogs. Weary of my wretched fate, I resolved to obtain my liberty at all hazards. Escaping by a miracle, I dared to cross the sea in a mere skiff: the hope of again seeing you redoubled my courage. Besides, I knew that you were in want of my assistance, and that, during my absence, you could scarcely have been able to earn enough for your support; and I longed to make you acquainted with a secret of which I alone am the possessor, and which cannot fail to enrich us. At this very moment, miserable and destitute as I am, I have it in my power to do inestimable service to Portugal. To-morrow I will explain to you my meaning; this evening I have need of repose, and have not strength to undertake so long a recital."

The next day Moralez related to his wife the circumstances which had so long detained him from her.

"You know," said he, "that I set sail in the spring of 1417, to pilot a merchant vessel which was returning to England. Being one day on the quay at Bristol, I was accosted by a young Englishman, who abruptly said to me,—

"Your name is Juan Moralez, and you are a pilot?"

"Yes, sir."

"I have heard a great deal of your skill and experience. Will you undertake to pilot a vessel which I have freighted to Cadiz?"

"I am at your service. When do you set out?"

"This very night."

"To-night! But the sea looks angry, and the wind is contrary."

"No matter! my affairs require me to leave England immediately. If you agree to accompany me, I will pay you royally."

"Though such great haste appeared most suspicious to me, the thought of seeing you once again, and increasing the sum I should bring you, determined me to follow the young man on board his vessel, which was lying within a mile of the coast. We set sail as soon as the boat which had brought us was hoisted up to the side of the vessel. The wind was south-south-west, and blew hard at intervals. We kept at first a direct course, but were soon obliged to lower our smack-sails, and hoist the lug and flying top-sails, and fly before the wind, without any regard to our destination. The storm lasted till the next day, and carried away our mizen-mast. For thirteen days we thus continued the sport of wind and waves,—lost in the solitude of the ocean,—when, at length, on the fourteenth day, land appeared in sight,—a beautiful and verdant land. Birds of brilliant plumage came and perched on our yards, and unknown animals came out of the woods to stare at us. It was Paradise, Pepita, with all its joys! Masham, our captain, ordered us to land, and descended the first into the boat, and with him a lady whom I had

not before seen, as she had not left her cabin during the voyage. She was weak and pale; grief and fatigue had overcome her. Poor lady! the history of her life was like that of many others: a youthful love, whose course proverbially never runs smooth—a marriage of interest—an elopement—a violation of her sworn faith. Alas! the two guilty ones have cruelly expiated their crime. They are both dead, Pepita! They escaped the tempest but to perish on the desert land. The woman, Anne Dorset, expired first; Masham followed a few days afterwards; and both are laid in that distant isle.

"After having paid them the last duties, we again set sail. A dreadful hurricane cast our vessels on the coast of Africa; half of our crew were engulfed in the waves; the rest, by clinging to the wreck, were enabled to reach the shore, where the Moors awaited us. I am the only survivor of all that had to endure the sorrows of captivity; God seems to have preserved me, lest that island, to which I only know the route, should remain uninhabited. He has chosen me to show it to my fellow-countrymen,—to enlarge, by a new conquest, the Portuguese possessions,—to increase the riches of my country,—and to ensure to myself, together with a brilliant position, an imperishable renown."

Juan Moralez pronounced these last words with such enthusiasm, that his wife caught the infection, and already saw him in command of a vessel, and discovering, like Marco Paulo, a new island of Cipango.

"I approve of your projects," said she, "though they will be the means of again separating us; they are those of a good patriot and a man of honour. But are you quite sure of the exact position of this unknown island?"

"Am I sure?" replied Moralez, drawing a roll of parchment from his portfolio. "Look, here is the plan I have drawn of it. This point is Cape Sagres, where we are at this moment; to the south are the coasts of the states of Barbary; by following them you will arrive at the mouth of a little river called Mulaya; I know it but too well, for it was there those cursed Mussulmen attacked our wrecked vessel. Well! almost opposite, to the west, observe the circle I have drawn; it is my island,—the island which we have discovered. Suppose, now, that we have set out from Sagres, by steering to the south-west we shall come directly to my dominion."

"But first," replied Pepita, "you must solicit an audience of the King, or rather of the Infant, who chiefly superintends the maritime affairs."

"I have thought of that, and I will spend this day in drawing up a petition. Quick, give me my desk; I feel quite inspired."

Moralez spent more than a week in composing and copying a detailed memorial. Then he presented himself at the gates of the Castle of Ternaubal, and demanded an audience of the Prince.

"Impossible, my good man," answered the officer of the guard. "Tormented by the number of solicitors, Don Henry has determined to refuse them all."

"May you not, at least, present him with a petition?"

"No; he has solemnly declared he will receive none. He has been confined to bed for some time. His physicians attribute his illness either to his

labours or his hard study; and the strictest repose has been ordered him."

"To whom, then, am I to apply?"

"To his Majesty, Don Juan, at his royal palace at Lisbon."

Moralez returned sorrowfully home, and communicated his disappointment to his wife.

"I would go at once to Lisbon," said he, "but it is a long way, and we have no money. I will wait, and go every day to inquire after the health of the Prince. Every moment that I am not engaged as a pilot, I will stand sentinel at the gates of the palace."

Faithful to this plan of conduct, Moralez for two months passed the greater part of the day in piloting vessels which were either coasting or entering the harbour. Every evening he went to inquire after the Infant, who was now recovering his exhausted strength. The guards and domestics of Ternaubal were become familiar with the indefatigable petitioner. Without acquainting them with his object, he spoke eagerly of the discovery of a land, whose magnificent forests he so enthusiastically described that they named him—"The Man of the Woods." (*El Nuemo de Madèra.*)

Moralez was almost beginning to despair, when, one morning on awaking, he heard his daughter say to some one at the door—

"Yes, Senor, it is here he lives; but he does not bear the title you have given him. His name is not Don Juan Moralez, but simply Juan Moralez, coasting-pilot by trade."

"Whatever his condition may be, Senora," replied the stranger, "he is a man of merit, honoured by the esteem of the Prince in whose name I present myself here."

"Welcome, Senor," cried the pilot, running to him half-dressed. "May God protect Don Henry, for having at length thought of his faithful servant! Pepita," cried he to his wife, "open a bottle of old port, and bring a feed of oats for the gentleman's horse. Well," added he, addressing the stranger, "the Prince is then restored to health, and is disposed to hear me?"

"Unfortunately, not just yet; before granting you an audience, he wishes to obtain some information as to what you require, and he has deputed me to learn the object of your petition."

"Nothing can be more easy, Senor; I will give it to you, if you will be kind enough to be the bearer of it."

"Such was the object of my visit, Senor. Give me your memorial, and it shall be laid this very day before Don Henry."

"Can it be possible?" cried the pilot.

"Nothing more certain; and, in three days, I myself will bring you the answer."

"In three days! Do you hear that, Pepita? In three days the Prince will know my project,—he will grant me a vessel for its accomplishment. I shall go out with the title of captain, take possession of the island in the name of His Majesty Don Juan the First, and on my return I shall be loaded with honours and riches. Ah! Senor, you are my good genius."

"You owe me no thanks," replied the stranger, quietly. "I am only obeying the orders of my master. Where is your petition?"

"Here it is."

"Have you carefully read it over?"

"I know it by heart."

"Have you nothing to add to it?"

"I think not; however, we can look over it together, Senor."

"That would be quite unnecessary. The Prince has charged me to receive from your own mouth some short statement; but he alone has a right to penetrate your secret, and to hear its details. He alone has a right to break the seal of your petition. Adieu, Senor Moralez, you shall see me again in three days."

The Cavalier rode rapidly away, leaving Moralez intoxicated with a joy which was shared by all his family. But, to their great surprise, the messenger of Don Henry did not appear on the third day.

"The prince has not had time to examine my scrawl," said Juan Moralez. "No matter, I am accustomed to have patience."

A week passed, and no messenger appeared.

"You must go look for him at Ternaubal," said Pepita.

"Undoubtedly," replied Moralez; "but I was so excited when he was here, that I forgot to ask his name."

"That forgetfulness is easily repaired; he must be well known; all you have to do is to describe him, and relate what has passed."

Moralez hastened to Ternaubal. On approaching, he heard the sound of bells, and the report of arquebusades, and learned that Juan the First and his royal consort the Duchess of Lancaster, were come from Lisbon to visit the Infant Don Henry, and were advancing to the castle, attended by a numerous suite, and an escort of archers. The pilot made his way through the crowd of people which were hastily ranging themselves on each side of the road through which the royal retinue were to pass, and looked about in eager search of his visitor, whom he soon perceived near the king, mounted on a magnificent palfrey.

"What is the name of that cavalier," said he to one of his neighbours, "with the cap and red plume, who is decorated with the order of Christ?"

"He is a new arrival at Court; his name is Nunez d'Alvadro; he was a lieutenant on board the vessel in the expedition to Ceuta, and appears to be in great favour for the last few days, without any one being able to tell why."

Moralez had not time to inquire more; the retinue having passed on, the order in which the two rows of spectators stood was broken, and the crowd rushed into the court of the castle. Carried along by the torrent, the pilot made his way through the guards, approached Nunez d'Alvadro, who was alighting from his horse, and seizing him by the arm, exclaimed—

"What about my petition, Senor?"

Nunez turned hastily round, and his face was covered with a deadly paleness, which the pilot attributed to anger.

"Pardon me," said he, "for thus importuning you, but you promised to come to me at the end of three days, and I have been expecting you in vain."

"Nevertheless, I have not forgotten you," replied Nunez, recovering from his consternation; "the Prince knows all about you, and I hope you will be able to speak to him before the day is over."

"How am I to accomplish that? The people, as usual, will be admitted into the royal apartments during the repast; shall I await that opportunity, or shall I follow you on the instant?"

"Come with me now," said Nunez, as if he had suddenly formed his resolution.

After having ascended some steps of the grand stair-case, they both passed through a long corridor, and entered an apartment of which Nunez had the key.

"This is the room I occupy at Ternaubal. Stay here until I call you; you will find some curious manuscripts in my library, which will while away the time."

"I am so grateful to you, Senor, for having deigned to use your influence for me."

"I have less than you think; but, as some services have procured me the esteem of the Prince, it is my duty to avail myself of my position, to encourage projects useful to the state. I must leave you, Senor Moralez; I shall not forget you. You have had a long walk; you must be hungry; would you like some refreshment?"

"I willingly accept your offer, though it is stupid enough to dine alone. In drinking to the health of Don Henry, I shall find the hours which will elapse before my interview with him less tedious."

Nunez d'Alvadro went out, and repaired to the stables of the castle, where he found his servant cleaning his horse. This servant was an African Moor, who had fallen to him as his share of the booty after the siege of Ceuta.

"Ben Hamed," said he to him, "you shall have your liberty and two hundred piastres, if you will obey my orders."

The Moor uttered a cry of joy.

"There is a man in my apartment," continued Nunez, "whose death is necessary to me."

"Master, give me your sword."

"No, his cries would be heard, and his body would bear marks of violence; his death must be attributed either to accident or suicide. You must rid me of him secretly, and without any noise. Listen to me; get him something to eat from the *maitre d'hotel*, and a flagon of wine. Before you go into the room, pour the contents of this vial into the wine; it is a powerful narcotic which he cannot resist. At the end of an hour, during which time you must let yourself be seen as much as possible, in order to avoid suspicion, you can then return to the man, who by that time will be in a deep sleep, and you can throw him out of the window into the moat of the castle."

"And you will swear to me, Senor, that I shall have my liberty?"

"I swear it on the cross of my order. To-morrow, at the break of day, the vessel of which I have obtained the command will set sail for an island off the coast of Africa. In passing, I will stop at Tunis, and will leave you there. With the sun you will have, it will be easy for you to return to your country."

"Master," said Ben Hamed, "you have always treated me honourably. You will restore me to my country, and all that you ask of me in return is to kill a Christian! I promise you that before midnight it shall be done."

"You may rely on my faith, as I rely on yours."

Nunez d'Alvadro hastened to the sea-shore, jumped into a boat, went on board the vessel, and gave the sailors orders, to be in readiness at a moment's warning. On his return to Ternaubal, a page brought him a letter from Don Henry.

"It is my commission!" exclaimed Nunez, joyfully. "Now the success of my plot is certain."

Fortune was near playing me a slippery trick, but I have retrieved all; and now it is I who will reap all the glory, which a miserable wretch would have usurped."

He returned on board to reiterate his instructions; then hastened to the banquet-hall, where the royal family were already seated. Around the table were a number of the inhabitants of Sagres and the neighbouring towns, who had been admitted to behold their Sovereigns, according to the custom observed in public banquets. The crowd becoming thinner a little before the dessert, Juan the First beckoned Nunez to approach, and congratulated him upon the discovery reserved to his courage. "My intention," added he, "is to be present at the departure of your vessel, and as, in order to do so, we must be up before day, we will now retire to our apartments."

"They are situated," said the Prince, "in the opposite wing. Permit me, my father, to show you the way."

All the guests rose, and descended the garden stair-case. Don Henry, who was first, suddenly stopped on perceiving a man asleep on the landing-place; and Nunez d'Alvadro was struck with astonishment and terror on recognising Juan Moralez. He was quietly lying at full length, like a drunkard overcome by abundant libations. He breathed heavily, but his flushed face expressed no emotion of any kind.

"Who is this man?" demanded the king.

"Undoubtedly some miserable drunkard," said Nunez. "Shall I have him carried out of the Castle?"

"No, Senor," said the Prince. "Let him be awakened, and I will question him."

Several now approached Juan Moralez, and shook him roughly by the shoulder many times, without being able to awaken him.

"Prince," said the physician, who always accompanied the king, "this man is not drunk,—he has only taken a strong dose of opium; but I have the means of rousing him from his lethargy."

"Set about it immediately," replied Don Henry.

The physician retired to prepare an antidote, the receipt of which he had obtained from the Arabs; and which simply consisted of a strong infusion of the grains of coffee.

In the meanwhile one of the attendants said to the Prince, "Prince, I know that man; his name is Juan Moralez. He is a coasting pilot, and surnamed the 'Man of Madeira.' During your illness he has continually presented himself at the gates of the castle, alleging that he had an important petition to lay before you; and that he knew the way to an unknown island, where he had landed with an Englishman named Masham."

"What does this mean?" demanded the Prince, turning to Nunez d'Alvadro.

"I do not know, my prince," stammered he; "perhaps this man was one of our crew."

During this conversation, the doctor had returned and given a draught to Juan Moralez, who was not long before he opened his eyes. The Prince began to question him, and the pilot faithfully related all that had passed.

"Whilst waiting for Don Henry," said he, in conclusion, "a Moorish servant brought me some wine and refreshments, and then left me alone. The heat of the weather making me very thirsty, I completely emptied the flagon which the Moor

had served up. In a few moments I felt the blood mounting to my temples; my face was covered with a profuse perspiration, and my sight became dim. Stunned and almost senseless, feeling the absolute necessity of movement and air, I opened the door and rushed into the passage; but my giddiness increased, my head swam round, and I fell senseless in the place you found me."

"So," said the Prince, "Nunez pretended to be my messenger."

"Yes," my Prince, "and I have given him the petition and charts, of which I have duplicates."

"Show me these documents. I see, Senor Moralez, that you have been the victim of a most odious betrayal of confidence; but ample amends shall be made you. You can sleep this night at the castle. I will send two of my guards to prevent your family from being uneasy, and to-morrow we will inquire into the affair. But where is Nunez d'Alvadro?"

Seeing his plot discovered, Nunez had taken advantage of the confusion caused by this incident to escape. Don Henry ordered that search should be made for the fugitive. The sentinel at the gates reported, that Nunez had left the castle on horseback, with his slave Ben Hamed.

"Menterez!" said the Prince to the Captain of the Guards, "go in pursuit of them, and, if the darkness hides them from you, at least take measures to find them before morning. To you, doctor, I confide Juan Moralez, and enjoin you to consider his life as precious as my own."

At these words the Prince went away, leaving the pilot as if in a dream. He had but a confused perception of the fact that had been revealed to him. His character was so opposite to anything like treachery, that he could not conceive any one capable of such a tissue of deceit. His situation presented mysteries above his comprehension. A shipwreck had opened to him the means of making his fortune. His triumph was the result of manoeuvres, the object of which was his ruin; and it was his enemy himself who had been the means of his introduction to the Prince. The course of these events seemed to him to be directed by an invisible hand, and he knelt in grateful acknowledgment of the Providential guidance of the Almighty. The same evening, he was presented by the Prince with one hundred ducats and a magnificent robe. The next day, Don Henry gave him a patent of nobility, and the *brevet* of a Captain of a vessel.

"I a Noble! I a Captain!" cried Juan. "Pepita will not believe it; nevertheless it is a fact, attested by the signature of Juan the First,—stamped with the royal seal. My Prince! I hope one day to die in your service."

"A truce to compliments, Senor," said the Prince. "Whilst you were taking repose, I examined and made enquiries about every thing that concerned you. Nunez d'Alvadro, abusing the powers that I delegated to him, set sail last night. We must not let this traitor have the glory of the discovery. Set out at once! Two vessels are anchored in the harbour of Sagres; one is to be commanded by Don Juan Gonsalvo Zarco, the other by you. I have given you, as coadjutor, this brave gentleman, because, two years ago, he discovered the island of Puerto Santo, which, as far as we have been able to ascertain, is in the neighbourhood of that which we shall call Madeira. Go, bid farewell

to your family, and be ready to go on board in three hours. Go! I have ordered a horse to be at your disposal."

Three hours after, the wife and children of Moralez were gazing earnestly after the vessel which was bearing him to an unknown country.

The two ships arrived at Puerto Santo, where they found some Portuguese whom Juan Gonsalvo Zarco had left there in his preceding voyage. Moralez consulted his charts, and saw that the island of Madeira ought to be to the south-west; no land appeared in that direction, but they perceived thick clouds rising out of the sea.

"Madeira is there," said the old Pilot to Juan Gonsalvo. "Those clouds are only the exhalations of its immense woods."

The two adventurers courageously set sail, and overcoming the fears of the sailors, they landed at Madeira, of which they took possession on the eighth of July, 1421, in the name of King Juan the First, and of the Prince Don Henry, Knight and Grand-master of the Order of Christ. They disembarked on a slip of land, and their first act was to visit the tomb of Masham and Anne Dorset.

Five days after the arrival of the Portuguese, the weather, which had been favourable during their voyage, suddenly changed. The sea became mountains high, and beat furiously on the rocks of the coast, and thunder clouds covered the heavens like a thick veil.

"Our vessels are in a safe bay," said Moralez, "but woe to any ship at sea in this dreadful weather! We have landed here the first; the vessel of Nunez d'Alvadro must be still on the way, and, in spite of his villainy, I cannot help pitying him and praying for him."

At this moment, the watchers stationed on the top-masts gave notice that there was a vessel in sight. The two commanders left the cabin for the deck, and distinguished, at a little distance, a vessel beaten about by the hurricane.

"That must be the vessel of Nunez," cried Zarco.

"Let us try to help him," said Moralez.

"It would be impossible," replied Zarco, "we could not put out our boats without exposing the lives of our men. Besides, the ship is already on the rocks, and the crew are clinging to the masts and broken pieces of the wreck."

"Perhaps we might be able to save some of them," said Moralez. "To the boats! my men. Bring ropes, boards, and empty casks!" Then, throwing himself into the boat with several sailors, he steered to the place where the struggling crew, and pieces of the vessel, were driven by the waves. But his efforts were unavailing; the sea engulfed all, and the only corpse which he succeeded in extricating from the waves, was that of Nunez d'Alvadro.

"Knowest thou not this of old, since man was placed upon earth, that the triumphing of the wicked is short." *Job* xx. 4, 5.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. VI.

THE moment Dr. Mildman arrived at home the next day, Lawless watched him into his study, and, as soon as he was safely lodged therein, proceeded, by the aid of sundry nails and loops previously placed there for the purpose, to hang his macintosh right across the passage, so that no one could leave the study without running against it. He then ambushed himself near the open door of the pupil's room, where, unseen himself, he could observe the effect of his arrangements. Coleman and I, also taking a lively interest in the event, ensconced ourselves in a favourable position for seeing and hearing. After waiting till our small stock of patience was nearly exhausted, we were rewarded by hearing the study-door slowly opened, followed by the tread of a well-known footstep in the passage. The next sound that reached our ears was a quick shuffling of feet upon the oil-cloth, as if the person advancing had "slyed" at some unexpected object; then came the muttered exclamation, "Bless my heart, what's this?" And immediately afterwards, Dr. Mildman's face, wearing an expression of the most thorough perplexity and bewilderment, appeared cautiously peeping from behind the macintosh. Having apparently satisfied himself that, no enemy being concealed there, he had nothing further to fear, but that the whole plot was centered as it were in the mysterious garment before him, he set himself seriously to work to examine it. First he pulled out his eye-glass, and stepping back a pace or two, took a general survey of the whole; he then approached it again, and taking hold of it in different places with his hand, examined it in detail so closely that it seemed as if he were trying to count the number of threads. Being apparently unwilling in so difficult an investigation to trust to the evidence of any one sense, he replaced his eye-glass in his waistcoat-pocket, and began rubbing a portion of the skirt between his hands; the sense of touch failing, however, to throw any new light upon the subject, as a sort of forlorn hope he applied his nose to it. The result of this was an indescribable exclamation, expressive of intense disgust, followed immediately by a violent sneeze; then came a long pause, as though he were considering of what possible use such a garment could be. At length a ray of light seemed to break in upon the darkness, and once more laying hands on the macintosh, he proceeded, after unhooking it from the nails on which it hung, slowly and deliberately to put it on, with the back part foremost, somewhat after the fashion of a child's pinafore. Having at length accomplished this difficult operation, he walked, or rather shuffled, (for his petticoats interfered greatly with the free use of his limbs,) up and down the hall, with a grave, not to say solemn expression of countenance. Appearing perfectly satisfied after one or two turns that he had at last solved the enigma, he divested himself of the perplexing garment, hung it on a peg appropriated to great-coats, and approached the door of the pupil's room.

By the time he entered, Lawless was seated at his desk studying Herodotus, while Coleman and I were deeply immersed in our respective Euclids.

After shaking hands with Oaklands, and addressing some good-natured remarks to each of us in turn, he went up to Lawless, and, laying his hand kindly on his shoulder, said, with a half smile—"I am afraid I have made rather an absurd mistake about that strange garment of yours, Lawless; I suppose it is some new kind of great coat, is it not?" "Yes, sir, it is a sort of water-proof cloth, made with Indian rubber." "Indian rubber is it? Well, I fancied so; it has not the nicest smell in the world. I certainly thought it was a smock-frock, though, when I saw you go out in it. Is not it rather

awkward to walk in? I found it so when I tried it on just now, and buttoning behind does not seem to me at all a good plan." "No, sir, but it is meant to button in front; perhaps you put it on the back part foremost." "Hem!" said Dr. Mildman, trying to look as if he thought such a thing impossible, and failing—"it is a very singular article of dress altogether, but I am glad it was not a smock-frock you went out in. I hope," (continued he, turning to Oaklands, with an evident wish to change the conversation) "I hope they took good care of you when you arrived last night?"

This was turning the tables with a vengeance! Lawless became suddenly immersed in Herodotus again. "Oh! the greatest," was the reply; "I had so much attention paid me, that I was almost upset by it. I was not quite overcome, though," he continued, with a sly glance towards Lawless, "and Mrs. Mildman gave us some very nice tea, which quite revived me." "Well, I'm glad they managed to make you comfortable among them," observed Dr. Mildman, turning over his papers and books, preparatory to beginning the morning's study. "Haden't you better ask him when he expects the sofa will be down?" suggested Coleman to Oaklands in a whisper. "No, you jackanapes," was the reply, "and don't you make me laugh when that old gentleman is in the room, for there's nothing more fatiguing than the attempt to smother a laugh." Coleman's only answer to this, if answer it could be called, was a grimace, which had the desired effect of throwing Oaklands into a fit of laughter, which he found it very hard labour indeed to stifle; nor had his countenance quite recovered from the effects of his exertions, when he was summoned to the Doctor's table to undergo an examination similar to that which had appeared so formidable to me a few days before; and thus terminated the notable adventure of the carter's frock, though I observed that after a week or two had elapsed, the macintosh was handed over to Thomas, and Smithson was called upon to tax his inventive powers to furnish Lawless with a less questionably shaped garment of the same material.

A few days after this, as I was walking with Coleman, he suddenly exclaimed, "Well, of all the antediluvian affairs I ever beheld, the old fellow now coming towards us is the queerest: he looks like a fossil edition of Methuselah, dug up, and modernized some hundred years ago at the very least. Holloa! he's going mad I believe; I hope he does not bite." The subject of these somewhat uncomplimentary remarks, was a little old gentleman in a broad-brimmed white hat, turned up with green, and a black cloth spenser, (an article much like a boy's jacket exaggerated,) from beneath which protruded the very broad tails of a blue coat, with rather more than their proper complement of bright brass buttons, while drab gaiters and shorts completed the costume.

The moment, however, I beheld the countenance of the individual in question, I recognised the never-to-be-mistaken mole at the tip of the nose of my late coach companion to London. The recognition seemed mutual, for no sooner did he perceive me than he stopped short, and pointed straight at me with a stout silver-mounted bamboo which he held in his hand, uttering a sonorous "Umph!" as he did so, to which somewhat unusual mode of salutation may be attributed Coleman's doubts as to his sanity. "Who'd ever have thought of meeting you at Helmstone, I should like to know!" exclaimed he in a tone of astonishment. "I was going to say the same thing to you, Sir," replied I: "I came down here the very day on which we travelled together." "Umph! I came the next: well, and what are you doing now you are here? Schoolmaster lives here, I suppose—Tutor, you call him, though, don't you?" I informed him of my Tutor's name and residence, when he continued, "Umph! I know him; very good man, too good to be plagued by a set of tiresome boys—men, though, you call yourselves, don't you? Umph! Is he a man, too?" he enquired, pointing to Coleman. "I've been a man these seventeen years, Sir," replied Coleman. "Umph,

a man seventeen years ago! a baby, more likely: what does he mean? what does he mean?" I explained that he probably intended a pun upon his name, which was Coleman. "A pun, umph? he makes puns, does he? funny boy, funny boy, I dare say. How does the Doctor like that, though? Make puns to him, he'd punish you, umph? Stupid things puns—made one myself then, though—just like me. Well, give the Doctor my compliments,—Mr. Frampton's—I live at No. 10, Castle-street,—he knows me, and ask him to let you come and dine with me next week: bring unny boy too, if he likes to come," and away he posted, muttering "Umph! plaguing myself about a pack of boys, when I might be quiet—just like me!" We did not fail to deliver Mr. Frampton's message to Dr. Mildman on our return home, who willingly gave us the required permission, saying that he knew but little of the old gentleman personally, though he had resided for several years at Helmstone, but that he was universally respected, in spite of his eccentricities, and was reported to have spent great part of his life abroad. The next time I met my new friend, he repeated his invitation to Coleman and myself, and, on the day appointed, gave us an excellent dinner, with quite as much wine as we knew what to do with; amused and interested us with sundry well-told anecdotes of adventures he had met with during his residence in foreign lands, and dismissed us at nine o'clock with a tip of a guinea each, and an injunction to come and see him again whenever we pleased.

For many succeeding weeks nothing of any particular moment occurred to interrupt the even tenour of the new course of life I had entered upon. The liking which Oaklands seemed to have taken to me at first sight soon ripened into a warm friendship, which continued daily to increase on my part, as the many noble and lovable qualities of his disposition appeared, one by one, from behind the veil of indolence which, till one knew him well, effectually concealed them. Coleman, though too volatile to make a real friend of, was a very agreeable companion, and (if it were ever possible to get him to be serious for a minute) showed that, beneath the frivolity of his manner, lay a basis of clear good sense and right feeling, which only required calling forth to render him a much higher character than he appeared at present. For the rest, I was alternately bullied and patronised by Lawless, (though he never ventured on the former line of conduct when Oaklands was present,) while Cumberland, although outwardly professing great regard for me, never let slip an opportunity of doing me an ill-natured turn, when he could contrive to do so without committing himself openly.

A more intimate acquaintance with Mullins only served to place beyond a doubt the fact of his being a most unmitigated, and not over amiable, fool. The word is a strong one, but I much fear that, if I were to use a milder, it would be at the expense of truth.

For my Tutor I soon began to conceive the warmest feelings of regard and esteem; in fact, it was impossible to know him well, and not to love him. Simple as a child in every thing relating to worldly matters, he united the deepest learning to the most elevated piety, while the thoroughly practical character of his religion, carried, as it was, into all the minor details of every-day life, imparted a gentleness and benignity to his manner which seemed to elevate him above the level of ordinary mortals. If he had a fault (I suppose, merely for the sake of proving him mortal, I must allow him one) it was a want of moral courage, which made it so disagreeable to him to find fault with any one, that he would now and then allow evils to exist, which a little more firmness and decision might have prevented; but, had it not been for this, he would have been quite perfect, and perfection is a thing not to be met with in this life.

Cumberland, after the eventful evening on which he acted as peace-maker between Lawless and Oaklands, had persevered steadily in his endeavour to ingratiate

himself with the latter; and, by taking advantage of his weak point, his indolence and dislike of trouble, had, at length, succeeded in making Oaklands believe him essential to his comfort. Thus, though there was not the smallest sympathy between them, a sort of alliance was established, which gave Cumberland exactly the opportunities he required for putting into execution certain schemes which he had formed. Of what these schemes consisted, and how far they succeeded, will immediately appear.

The winter months, after favouring us with rather more than our due allowance of frost and snow, had at length passed away, and March, having come in like a lion, appeared determined, after the fashion of Bottom the weaver, "to roar that it would do any man's heart good to hear him," and to kick up a thorough dust ere he would condescend to go out like a lamb, albeit, in the latter state he might have made a shilling per pound of himself at any market, had he felt suicidally inclined.

"This will never do," said Oaklands to me, as, for the third time, we were obliged to turn round, and cover our eyes, to prevent being blinded by the cloud of dust which a strong east wind was driving directly in our faces; "there is nothing in the world tires one like walking against a high wind. A quarter to three," added he, taking out his watch. "I have an appointment at three o'clock. Will you walk with me? I must turn up here." I assented; and, turning a corner, we proceeded up a narrow street, where the houses, in a great measure, protected us from the wind. After walking some little distance in silence, Oaklands again addressed me—"Frank, did you ever play at billiards?" I replied in the negative. "It's a game I've rather a liking for," continued he; "we have a table at Heathfield, and my father and I often played when the weather was too bad to get out: I used to beat the old gentleman easily though at last, till I found out one day he did not half like it, so then I was obliged to make shocking mistakes, every now and then, to give him a chance of winning; anybody else would have found me out in a minute, for I am the worst hand in the world at playing the hypocrite, but my father is the most unsuspecting creature breathing. Oh! he is such a dear old man. You must come and stay with us, Frank, and learn to know him and love him—he'd delight in you—you are just the sort of fellow he likes." "There's nothing I should like better," answered I, "if I can get leave from head quarters; but why did you want to know if I played at billiards?" "Oh! why, I have been playing a good deal, lately, with Cumberland, who seems very fond of the game, and I'm going to meet him at the rooms in F—Street to-day; so I thought, if you knew anything of the game, you might like to come with me." "Cumberland is a first-rate player, isn't he?" asked I. "No, I do not think so; we play very evenly, I should say; but we are to have a regular match to-day, to decide which is the best player." "Do you play for money?" "Just a trifle to give an interest to the game, nothing more," replied Oaklands; "our match to-day is for a five-pound note." I must confess that I could not help feeling extremely uneasy at the information Oaklands had just given me. The recollection of what Coleman had said concerning some gaming affair in which Cumberland was supposed to have behaved dishonourably, combined with a sort of general notion, which seemed to prevail, that he was not exactly a safe person to have much to do with, might in some degree account for this; still I always felt a kind of instinctive dislike and mistrust of Cumberland, which led me to avoid him as much as possible on my own account. In the present instance, when the danger seemed to threaten my friend, this feeling assumed a vague character of fear; "and yet," reasoned I with myself, "what is there to dread? Oaklands has plenty of money at his command; besides, he says they play pretty evenly, so that he must win nearly as often as Cumberland; then, he is older than I am, and, of course, must be better

able to judge what is right or wrong for him to do." However, remembering the old adage that "lookers on see most of the game," I determined, for once, to accompany him; I therefore told him that, though I could not play myself, it would be an amusement to me to watch them, so that, if he had no objection, I would go with him, to which proposition he willingly agreed. As we turned into F—Street, we were joined by Cumberland, who, as I fancied, did not seem best pleased at seeing me, nor did the scowl which passed across his brow, on hearing I was to accompany them, tend to lessen this impression. He did not, however, attempt to make any opposition to the plan, merely remarking that, as I did not play myself, he thought I should find it rather dull. After proceeding about half way down the street, Cumberland stopped in front of a small cigar-shop, and, turning towards a private door, on which was a brass plate with the word "Billiards" engraved on it, knocked, and was admitted. Leading the way up a dark, narrow staircase, he opened a green baize door at the top, and ushered us into a tolerably large room, lighted by a sky-light, immediately under which stood the billiard-table. On one side was placed a rack, containing a formidable arrangement of cues, maces, &c., while at the farther end two small dials, with a brass hand in the centre for the purpose of marking the scores of the different players, were fixed against the wall. As we entered, two persons who were apparently performing certain intricate manoeuvres with the balls by way of practice, immediately left off playing, and came towards us. One of these, a little man, with small keen grey eyes, and a quick restless manner, which involuntarily reminded one of a hungry rat, rejoiced in the name of "Slipsey," and proved to be the billiard-marker; his companion was a tall stout person, with a very red face, rather handsome features, large white teeth, and a profusion of bushy whiskers, moustaches, and imperial of a dark brown colour. His dress consisted of a blue military frock coat, which he wore open, to display a crimson plush waistcoat, and thick gold watch-chain, while his costume was completed by a pair of black and white plaid trowsers, made in the extreme of the fashion, with a broad stripe down the outside of the leg. This personage swaggered up to Cumberland, and, with a manner composed of impertinent familiarity and awkwardness, addressed him as follows:—"How d'ye do, Mr. Cumberland? hope I see you well, Sir. Terrible bad day, gentlemen, don't you think? dusty enough to pepper the devil, as we used to say in Spain, hey? Going to have a touch at the rolley-polleys, I suppose?"

"We shall be disturbing you, Captain Spicer," said Cumberland, who, I thought, had tact enough to perceive that his friend's free and easy manner was the reverse of acceptable to Oaklands. "Not at all, not at all," was the reply; "it was so terrible unpleasant out of doors, that, as I happened to be going by, I thought I'd look in, to see if there was anything up; and as the table was lying idle, I got knocking the balls about with little Slipsey here, just to keep one's hand in, you know." "Well, then, we had better begin at once," said Cumberland, to which Oaklands assented rather coldly. As he was pulling off his great coat, he whispered to me, "If that man stays here long, I shall never be able to stand it: his familiarity is unbearable; there is nothing tires me so much as having to be civil to those kind of people." "How is it to be?" said Cumberland, "whoever wins four games out of seven is the conqueror, wasn't that it?" "Yes, I believe so," was Oaklands' reply. "A very sporting match, 'pon my life," observed the Captain; "are the stakes high?" "Oh no! a mere nothing: five, or ten pounds, did we say?" enquired Cumberland. "Just as you like," replied Oaklands, carelessly. "Ten pounds, by all means, I should say; five pounds is so shocking small, don't you think? not worth playing for!" said the Captain. "Ten let it be then," said Cumberland; and after a few preliminaries they began playing.

I did not understand the game sufficiently to be able to give a detailed account of the various chances of the match, nor would it probably greatly interest the reader were I to do so. Suffice it, then, to state, that, as far as I could judge, Oaklands, disgusted by the vulgar impertinence of the Captain, (if Captain he was,) thought the whole thing a bore, and played carelessly. The consequence was that Cumberland won the two first games. This put Oaklands upon his mettle, and he won the third and fourth; the fifth was hardly contested, Oaklands, evidently, playing as well as he was able, Cumberland, also, taking pains; but it struck me as singular that, in each game, his play seemed to depend upon that of his adversary. When Oaklands first began, Cumberland certainly beat him, but not by many; and, as he became interested, and his play improved, so in the same ratio did Cumberland's keep pace with it. Still, there might be nothing in this; the same causes that affected the one might influence the other; but the idea having once occurred to me, I determined to watch the proceedings still more closely, in order, if possible, to make up my mind on the point. After a very close contest Oaklands also won the fifth game; in the sixth he missed a difficult stroke, after which he played carelessly, apparently intending to reserve his strength for the final struggle, so that Cumberland won it easily. Each had now won three games, and on the event of the seventh depended the match. Again did Oaklands, who was evidently deeply interested, use his utmost skill, and his play, which certainly was very good, called forth frequent eulogiums from the captain, who offered to bet unheard-of sums on the certainty of his winning, (which, as there was no one in the room in the least likely to accept his offer, was at all events a very safe and innocent amusement,) and again, *pari passu*, did Cumberland's play keep pace with his. After keeping neck and neck, till nearly the end of the game, Cumberland gained a slight advantage, which produced the following state of affairs:—It was Oaklands' turn to play, and the balls were placed in such a position that by a brilliant stroke he might win the game, but it required great skill to do so. If he failed, the chances were so much in Cumberland's favour as to render his success almost a certainty. It was an anxious moment: for my own part, I felt as if I scarcely dared breathe, and could distinctly hear the throbbing of my own heart, while the captain, after having most liberally offered to bet five hundred pounds to five pence (and no takers) that he did it, remained silent and motionless as a statue, watching the proceedings, with his eye-glass screwed after some mysterious fashion into the corner of his eye. And now, carefully and deliberately, Oaklands has pointed his cue,—his elbow is drawn back for the stroke,—for the last time his eye appears to measure and calculate the precise spot he must strike to produce the desired effect,—when suddenly, and at the exact moment in which the cue struck the ball, a sonorous sneeze from the rat-like billiard-marker resounded through the room, as a necessary consequence of which, "Oaklands gave a slight start and missed his stroke. The confusion that ensued can "better be imagined than described," as the newspapers always say about the return from Epsom. With an exclamation of anger and disappointment Oaklands turned away from the table, while the captain began storming at Slipsey, whom he declared himself ready to kick till all was blue, for the trifling remuneration of half a farthing. The marker himself apologised, with great contrition, for his delinquency, which he declared was quite involuntary, at the same time asserting that, to the best of his belief, the gentleman had made his stroke before he sneezed; this Oaklands denied, and appealed to Cumberland for his opinion. After trying in various ways to avoid giving a direct answer, and appealing, in his turn, to Captain Spicer, (who was so intensely positive that the sneeze had preceded the stroke, that he was willing to back his opinion to any amount,) Cumberland very reluctantly owned that, if he was forced to say

what he thought, he believed Oaklands had made his stroke before the sneeze caused him to start, but that it was a near thing, and he might very possibly be mistaken. This was quite enough for Oaklands, who declared that he was perfectly satisfied, and begged Cumberland to play, which, with some apparent reluctance, he did, and as was almost a matter of certainty, proved the conqueror. "Pon my life, in all my experience, I never knew a gentleman lose a match in such a tremendously unfortunate way," observed the captain. "I am certain that if you had not been flurried, Mr. Oaklands, Sir, you could have done the trick as clean as a whistle. Allow me to place the balls as they were then—I know how they stood to a nicety—there, that's it to a demi-semi fraction; oblige me, Sir, just as a personal favour, by trying the stroke once more." Thus invoked, Oaklands approached the table, and, without a moment's deliberation, struck the ball, and succeeded in doing with perfect ease the very thing which a minute before would have won him ten pounds. "There! I was super-certain you could do it; the match was yours, Sir, as safe as the bank, if that wretched little abortion there hadn't made that disgusting noise. Play him again, Sir; play him again: Mr. Cumberland's a pretty player, a very pretty player; but you're too strong for him, Mr. Oaklands; it's my firm conviction, you're too strong for him." "What do you say to giving me my revenge, Cumberland?" asked Oaklands. "Oh! I can have no possible objection," replied Cumberland, with the slightest imaginable assumption of superiority in his tone, which annoyed my ear, and which I felt sure would produce the same effect upon Oaklands. The next game Oaklands won; and they continued to play the rest of the afternoon with various success, and for what appeared to me very high stakes. I calculated that, by the time they left off, Oaklands must have lost more than thirty pounds; and yet, in spite of this, to a superficial observer he appeared to be the better player of the two, he certainly made the most brilliant strokes, but he also made blunders, and failed now and then; while Cumberland's score mounted up without one's exactly knowing how; he never seemed to be playing particularly well, and yet there was always something easy for him to do; while when Oaklands had to play, the balls got into such awkward positions that it appeared as if they were leagued against him.

Besides this, many things concurred to strengthen me in my preconceived idea, that Cumberland was accommodating his play to that of Oaklands, whom, I felt certain, he could have beaten easily, if he had been so inclined. If this were really the case, the only conclusion one could come to was, that the whole thing was a regularly arranged plot: the object of which was to win as much as he could of Oaklands' money. The marker's sneeze too occurring so very opportunely for Cumberland's interest; and the presence of the Captain, who, by his eulogiums on Oaklands' skill, had excited him to continue playing, while by his observations and advice, he had endeavoured (whenever it was possible,) to raise the amount of the stakes; all this favoured my view of the case. Still these were but suspicions, for I was utterly without proof: and could I on mere suspicion tell Oaklands that he was a dupe, and Cumberland a knave? No, this would never do; so I determined, as people generally do when they are at their wits' end, and can hit on nothing better, to wait and see what time would bring forth, and act according to circumstances.

Should any of my readers think such penetration unnatural in a boy of my age, brought up in a quiet country parsonage, let them remember, that, though utterly ignorant of the ways of the world, I was what is called a quick sharp boy; that I had been informed that Cumberland was not a person to be trusted, nay, that he was known to have cheated some young man before; and that, moreover, my very unworldliness and ignorance increased my suspicions, inasmuch as it seemed to me, that playing billiards, at a public table, for what I con-

sidered large sums of money, was neither more nor less than gambling; and gambling I viewed in the light of a patent twenty-devil-power man-trap, fresh baited, (in the present case with a billiard cue, and balls,) by the claws of the Old One himself; consequently, I was prepared to view every thing that passed with the greatest mistrust; and, in such a frame of mind, I must have been blind, not to have seen something of what was going on.

TWO DAYS IN THE TYROL.

READER, did you ever hear of such a place as Ischl?—Unless you have been in Germany, I would bet ten to one you never did; and yet it is a place known to, and frequented by, Counts and Dukes small and great, Kings, aye, and Emperors and Empresses. It is a little town in the Carinthian Tyrol, and the most fashionable of the Austrian watering-places. What makes it so I cannot tell; for, though the medicinal waters there are especially disagreeable, yet even the height of nastiness in this respect will scarcely make a place fashionable without other adjuncts, and there are none of these at Ischl; the theatre is small and miserable, the balls few and far between, the cafés wretched, and, above all, there is no gaming table. The only possible attraction is the beauty of the scenery; but, however strong an inducement this might be in England, it can, I should think, have little effect in Austria, whose people have as small an organ of the picturesque as any on the face of the globe. However, there is one class to whom the presence of the great ones of the earth would make Ischl a place of undying interest;—I mean those respectable personages, who are always running after a title—who gaze at a Royal Highness as connoisseurs do at a Raphael or a Rubens. But this is a kind of taste with which I never could get myself inoculated, and, as there was nothing else to be seen at Ischl, I and my companions found that a summer afternoon had exhausted the lions of the little place. We had seen the bath house, something like a pastrycook's Grecian temple, only made of painted wood instead of sugar; the manufactory of salt, which forcibly reminded me of an English gas works; and eaten a very bad and dear dinner. All this done, we called a council of war, and, smoking the pipe of consideration, began to weigh our future course. We were three in number, all young and blessed with good legs, and, having a day to spare, we resolved to devote it to visiting the Lake of Hallstadt, which lies about ten miles south of Ischl, and which every body, including that universal referee in matters of the picturesque, Murray's Guide Book, advised us to see. I cannot help thinking that the organ of punctuality is one of which the German organization is perfectly devoid—judging, that is to say, from experience. You shall give orders when you go to bed that you are to be called at six precisely—you are assured that you will be so called—the waiter or the boots or chambermaid will swear it fervently—you go to bed with a light heart, and are called, indeed, most carefully, but—at eight o'clock, and if you are a heavy sleeper you may be thankful if you are not left snoring on till nine. This provoking irregularity has been experienced by me fifty times, and we had a specimen of it at Ischl. Instead of being called at five, it was seven ere the rousing knock came—then, of course, all was hurry—breakfast was swallowed—the waiters scolded for their negligence, and we sallied lustily forth, enraged at our unintentional lateness.

We were not a bit too late, however; had we been sooner the mist would have totally prevented anything like a view. When we first rose it filled the whole valley with its silvery obscurity, so that we were in the condition of that people described by Herodotus as not being able to see a yard before their noses. Soon, however, the sun poured a rich red glory through the haze, and by the time we started the whole was rolling rapidly up with an effect as if a mighty panorama had been gradually expanded before our eyes. The little town where we had passed the night lies in a deep hollow, surrounded by lofty mountains, seemingly so close to each other that one almost wonders there can be room for anything but a footpath between them, and yet there is a beautiful valley stretching for many miles, and covered with woods that reach far up the hill sides. As you leave the wood you come on a broad extent of green pasture land, studded here and there with the pretty little Tyrolese farm houses, and gay with a luxuriance of wild flowers, which contrast strongly with the grey rugged rocks so near at hand. In the freshness of the morning air all these beauties were increased ten-fold. The rays of the sun glittered in the dew-drops hanging on every leaf, and tinged with red the lingering masses of mist that yet clung here and there to some hollow in the mountain side. It was one of those mornings which rouse up every kindly and every active feeling,—when you are irresistibly desirous of shaking hands with every man, and patting on the head every child you meet,—when it is infinitely more easy to run than to walk,—and it is quite impossible to avoid bursting out every now and then into loud shouts of laughter—not that there is anything to laugh at, but just for the fun of the thing, and because you can't help it. In this state of mind, when we came upon a man driving two horses in an open carriage, who asked if we would not take a lift, we were almost inclined to decline his offer; but we had a long way to go, and the morning was far advanced—so a bargain was easily struck, and in we jumped. Our friend was one of those hackney coachmen on a large scale, common on the continent, called *Vetturini* in Italy, and *Lohnkutscher* in Germany, who engage to take one with their own horses any distance—to the world's end if you choose—for so much a day. It is not a very rapid, but a pleasant and cheap method of conveyance, and still cheaper if you can manage to get a coach returning to its head quarters. This *Lohnkutscher* was returning to Golling, whence he had come the night before, and, as he must necessarily pass the foot of the Lake of Hallstadt, agreed to set us down there for a very small sum. I don't know any more agreeable travelling than this quiet jogging through the Tyrol—the valley always so lovely and green, and the mountains so grand—and then every now and then you come upon a clump of apple trees overshadowing two or three odd little cottages built of wood, with huge gables turned to the road, and open galleries running round the second story, and either a rude painting or some quaint motto inscribed outside, as, "God guard us from fire," or, "God bless all who dwell here," and so forth—or, if the resident there be a skilful marksman, there are two or three targets, pierced through with rifle balls, hung up as trophies. Then the passing by even of a single carriage is a matter of such moment, and the children all come running out to have a stare at the "*Englische Herren*"—(they know in an instant if they are English,) as if the inhabitants of our island were ogres instead of men, or displayed (as the South Americans, during the revolutionary war, were led by their priests to believe) the original appendage of which *Monboddó* was so fond.

Trundling on in this way, we at length became aware (as the romancers phrase it) of a range of hills, which ran at right angles to our path, and seemed to block up all further progress; and, indeed, the appearance was not deceptive, for on approaching these rocks we found ourselves at the foot of the lake, which stretched away

to the left along the base of the hills. Here our coach left us, and we proceeded to apply at a little public house situated here for a boat. A couple of rowers were soon furnished, and we embarked and commenced our voyage. Our vessel resembled rather a large box without a lid, and somewhat narrowed at the ends, than a boat. It was formed of straight unpainted planks, two or three of which formed the bottom, some more the sides, and some shorter ones, laid at an obtuse angle, the prow and stern—there was no keel and no bend in the whole affair, which was propelled by two paddles worked by the men standing upright with their faces to the prow—nevertheless, startling as such an equipage might appear to a Thames wherry-man, it united the three requisites of safety, speed, and comfort, in the highest degree—and, had it possessed none of these qualities, the scene around was sufficient to justify our forgetting them all.

There was not a cloud in the sky; and the bright blue water lay so clear and so still, that we could see many many feet down into its placid depths. On our left, a high unbroken ridge of hill rose sheer up from the water's edge. On our right was that same mountainous line of which I have spoken, running close by the lake, and yet leaving space for a small grove of dark trees, whose shadows were reflected in the calm water. Above them the rocks rose grey, black, and green—here a patch of lichen, there some more sheltered spot where grass yet grew, and again a mass of bare rugged stone. About halfway up the lake, the hills were interrupted by a valley which came down to the water-side, leaving a small open ground between the mountain and the lake, which was occupied by sheds for wood, and ran out in a promontory, so that we were obliged to steer round, in order to avoid being grounded. When we had passed this point we found ourselves in view of the head of the lake. It is called a lake, but is, in fact, a mere gigantic water-pool in the living rock. On every side the cliffs reached down to the very water-edge, rising in precipices many hundred feet in height. The road has turned off up the valley; there is not even a footpath along the water-side, and yet high up there is something running along the face of the precipice which looks like a road. Ah! that is no path for man—it is the wooden duct which conveys the salt brine from the mine at Hallstadt to the works many miles off. There you see it runs along the rocks; it crosses the valley in that immensely high aqueduct which stares above the trees, and, joining the hills again, pursues its venturous path, carrying pickle enough to serve for curing all the pork in Austria. However, we have now reached the village,—there it is on the right-hand—that extraordinary-looking collection of grotesque cottages, built on the hill-side, and that hill-side so steep that at a little distance they seem piled on each other like the stories of a card-house, and in truth, they look little less strange when you come near. The lowest houses have all a water-entry, and the best looking one, which is the principal inn, has quite a little haven, running out in an attempt at a garden, and in this haven lie two or three boats. We steer into it, and so are landed.

We were welcomed by mine host himself, a fat man—a gross fat man, without either waistcoat or neck-cloth—the sort of man who always reminds you of a larded capon roasting before a large fire; but with a merry countenance withal, as if he rejoiced in the glorious dish he was about to form, and a deep chuckling voice. There was his wife, too, who had been handsome some ten years ago, and still preserved a good figure and an unexceptionable ankle, which her short petticoats displayed to the fullest advantage. She was evidently the active partner in the concern; her husband's duties being apparently limited to chatting with the guests, and receiving orders for eatables. He served us in both ways; giving us to understand, that the only lion to be seen was a waterfall about

two miles up the glen, and that we could have dinner immediately. We accordingly ordered the latter, and determined to discuss it before setting off to see the former.

Meantime let us smoke a pipe and take a glass of beer, just to give us an appetite. I can tell you it is no bad thing, that mild bitter beer, on a hot day, and mingles most deliciously with the balmy taste of the fragrant canaster. The window of the principal room on the first floor opened on a large railed balcony, which formed the porch of the house; here we sat in all the luxury of perfect idleness, now watching the smoke as it curled languidly up in the air, and now gazing upon the scene around. The lake at this end widened, or rather bent away before us, into a hollow of the mountain, which rose high, bare, and precipitous,—as wild and impassable a corrie as might be. At the bottom, it was a mere mass of huge rocks flung about and piled together, as if by the action of a mighty whirlpool, and looking as if it had at sometime been indeed the cauldron of some such fearful plaything of Nature. On the right stretched a vast mountain, bare, too, and rocky, but dotted here and there with a few scanty straggling trees, which cast their dark wavering shadows on the arid stone. About us, behind, and on either side was the village, nestling in a hollow of the hill, amongst verdure and trees, which looked all the greener and brighter for the sterility beyond. Some of the houses were of white stone, the new ones; and they mingled oddly enough with the grotesque cottages of older date; these latter looked even more quaint and odd than most of the Tyrol houses, built of wood, with huge eaves and galleries, and painted red, or sometimes black, as if made of old coffins. On a prominent shelf of rock, high up, was the pretty little gothic church; and above all, again, at the very summit of this hill, half hidden in the trees, stood the old tower, built ages ago to defend the salt-works. All was still and changeless, save when the song came slowly and softly from one of the boats plying down the water, for a small cloud shifted leisurely over from one side of the lake to the other, moving with it its dark shadow over the face of the green glossy water. But now for the dinner: he had no great variety, the landlord said, but whatever there was, was good; and he was right. First of all, soup—of course: the most imaginative German that exists, and they are allowed to be a very imaginative people, could never dream of such a thing as dinner without soup—it would be absolutely impossible—you might as well talk of dinner without anything to eat. Often have I said, "I don't want any soup; I don't care about it; I won't eat it;" all in vain—there it is brought up, hot and greasy, and you can't get anything else till that is finished,—they know what is right, if you don't. The soup on this occasion, however, was excellent. Then there was the beef which it had been made from; somewhat tough and stringy, and perhaps a little too tasteless for an epicure; but still an excellent thing for stuffing up a cavity. And then eggs—hard-boiled eggs. That was our dinner, and we felt all the better for it; which is more than can always be said of more sumptuous repasts. Meantime we had been discussing our future route. We wished very much to pass the night at the village of Gossau, which lies some ten miles to the back of Hallstadt, up the glen which we had passed in coming up the lake. The landlord was accordingly interrogated. He informed us that there was a sort of road from Hallstadt through the mountains to Gossau, and that he would try and procure us a horse and carriage to take us there. The one horse which was available belonged, we found on further enquiry, to a peasant who lived some way off. A boy was despatched to him, and we meanwhile started to see the waterfall.

First of all, however, we scrambled up to the church, and now obtained full experience of the eccentricities of this village. It resembles nothing I have ever seen or

heard of, except the houses dug in the rocks of Idumea. If you can imagine a village built on the slope of a gravel pit, you will have some idea of the relative positions of the houses of Hallstadt:—one row is so placed above another, that you can almost step from the roof of one, to the doorstep of another. Streets there are none; in place of them they have flights of steps, and the road up to the church is a capital specimen; it is neither more nor less than a covered staircase, something like the common stairs of Edinburgh and the continental towns, only that, instead of opening on different flats or stories, it opens, from the nature of the ground, on separate houses. The church is built on a small terrace of rock, with a minute terraced churchyard, the view of the lake from which is even finer than from the balcony of the inn; but our pleasure was quite destroyed by the presence of three or four miserable idiots, with large goitres, who crowded round, uttering incoherent and hideous cries for money; we were glad to escape from them, and, making our way down the staircase, again climbed to the principal place, which is adorned with a magnificent pump, and is remarkable as the most level part of the village, the fall in the ground not being much more than one foot in three. From this we proceeded through some scattered houses into the valley which runs back from the town, and at the head of which, we were told, we should find our waterfall.

The walk up this vale is magnificent; the lower part is broad, and divided into meadows for pasturage. As you get higher up, however, the hills contract, the valley becomes clothed with wood, and a little stream runs pleasantly along, singing, as if it liked playing at leap-frog over the stones; but the fact is, it is rejoicing at the dangers it has past. You see little falls of eight or ten feet over moss-grown rocks; the path becomes steep and slippery; and the massive mountains, covered even up to their round tops with dark fir wood, come nearer and nearer, till they almost seem to overhang you; you come upon a wooden bridge spanning the stream, and from it look up to the water, boiling and foaming over a precipice of some twenty feet, partly natural, and partly a dam formed to keep in the water, so as to allow of the sluice being opened, in order to float down wood. But you have farther still to go up your scramble, over broken stones, and half worn corduroy steps, till you come upon the head of the glen, a deep gloomy corrie, many hundred feet in height. On all sides is one unbroken precipice; but never mind, there is a little straggling path, up which we scramble, and stand almost *inside* the cascade; roaring and shrieking, foaming, hissing and screaming, down it comes, a torrent of water jumping two hundred and forty feet at once; behind us rose the wall of bare brown rock, in front the same, crowned with dark over-hanging fir trees, and at our feet, far below, the boiling pool, raging again over another precipice. The spray dashed over us, scattering far and wide. From the cauldron beneath rose a white watery mist of foam, and the sun, bursting out at this moment, lighted up a glorious rainbow between us and the opposite rock. Bah—this is all very poetical, but if we stand here many minutes, we shall be wet to the skin; so we scramble down again, not altogether without danger, I can tell you, for the rocks are wet and slippery enough, and a loss of hold would send one down some fifty feet into the pool below. However, we attain again our first point of sight, a pleasant enough place, railed in for fear of falling over, and a modern seat, most agreeable for genteel ladies, and sentimental gentlemen-tourists; but there is a path to the lowest point of the fall, so we trundle down, and here we are, looking up at the pool into which the first fall empties, some twenty or thirty feet above us, while close beside lie the huge stones over which the still excessively angry water dashes, scolds, and tumbles. This is the finest point of all, and you may stay here as long as you like. For my part, I stayed a very short time, for, though the sun was broiling hot above, here it was miserably cold, and I felt as if stand-

ing at the bottom of a well on one side, while somebody was pouring buckets full of water down the other. So then we had seen the waterfall of Hallstadt, and a very fine one it is, too, for those who are fond of such things, as the lady said when she kissed her pet-toad; for my part, I am fond of them—I mean waterfalls, not toads—and I don't quite enter into the feelings of the gentleman who was so disappointed at Niagara, and said it was nothing but some water poured over a few stones,—they might be large or small, he didn't see the difference. And now, there is no time to spare; we must get back as fast as we can, or we shan't be in time to push on to Gossau; but going home is always a much quicker affair than going out, especially down hill; and so by the time we reach Hallstadt again we have had a most delightful walk. Delightful? yes, but for one circumstance—the terrible number of those poor mountain idiots which one meets with in every direction. It is a fearful penalty to pay for living in a beautiful mountain land. At Hallstadt it is exacted to the fullest—the worst parts of Switzerland are not worse in this respect than this lovely little village—and yet in the surrounding country the people are by no means very much afflicted with the curse of the mountains. But here, as we walked up the glen, the road positively swarmed with the most wretched Cretins—miserable stunted creatures, deformed in body as in mind, without any power of speech, and caring but for one thing—money; to obtain this they ran after us, uttering their fearful inarticulate howls, till sick and almost terrified, we absolutely took to our heels, and fairly ran for it.

The goitre, too, that less fearful form of the same calamity, is still more prevalent—the exception here is not to have it, but to be without it; and I verily believe there is not one in ten of the inhabitants of Hallstadt without this disgusting deformity—whether they have got to the point of considering it a beauty, I do not know.

On reaching the inn, we found our little messenger returned with the news that we could not have a horse to go to Gossau, as the peasant to whom it belonged was employed in carrying in his hay, and could not put off that important operation: so here was an end to our further progress, and all we could do was to get into the boat again and return to Ischl. We embarked, accordingly, with heavy hearts, and began our voyage down the lake; but it was a hard matter to give up all attempts to see Gossau, of which we had heard so much. It was a lovely evening, and, as we repassed the valley crossed by the salt aqueduct which runs up to it, we faltered, consulted, and determined on making Gossau. I shall never forget the blank look of astonishment with which our boatmen heard the order to land us at once—they could not conceive what we would be at—we had hired them to go to the bottom of the lake, and they could not land us half way—finally, which was most important, they must, at any rate, receive full fare; however, a few words eased their scruples on this head, the boat turned swiftly to one side, a stroke or two brought us to shore, and we sprang on land, leaving our boatmen in a paroxysm of wonder.

Meantime we were hurrying up the road, above which the aqueduct crosses the valley; it is, indeed, a stupendous work, considering its situation and object; its arches, springing from the very bottom of the ravine, span the valley from side to side at a height of 160 feet, and, gigantic as are the objects of nature around, this light and airy fabric of man's workmanship, so far from looking mean and puerile, harmonizes and seems quite in accordance with them. But we have no time for stopping—on we go. The road hewn out of the rock runs some fifty feet above the bottom of the glen, along which rushes a foaming stream, which you rather hear than see, so densely are its precipitous banks clothed with birch and fir trees. Above you rises the rock, many hundred feet high, in one unbroken precipice, clothed also with fir-trees that nod and whistle in the evening

breeze. But, by degrees, the path descends till it almost reaches the level of the stream, and then we cross by a wooden-bridge, and look back down the valley; a mighty tunnel, as it were, of gigantic hills standing lonely, unclimbable, and unbroken; and, at the end, stopping up the entrance, is a huge straight-backed hill, like a wall of granite. That is the hill on the farther side of the Lake of Hallstadt, four or five miles from the mouth of the glen, but from this it looks as if it touched it, closing us up in a perfect Russell's valley, without entrance or approach. As we proceed farther, the scene increases in wild sublimity—the hills, still perpendicular as ever, become almost bare, with here and there a few firs in the fissures of the rock—the valley grows narrower, and more narrow, till at length there is only room for the bed of the stream, and the road running beside it. On one hand rises a huge amphitheatre of naked, broken, sandy rock, that looks as if the half of the mountain had been torn away by some tremendous volcanic force. On the other, a mighty wall of black rock springs up sheer perpendicular, without a crag or even a fissure, many hundred feet high. Around it are trees innumerable; but this rises bare and sterile, scarce a moss or a lichen on its blasted surface. And here, in this scene of inconceivable wildness and sublimity, the sublimity of gigantic, unrestrained, and almost untrodden Nature, hangs, by the road side, a memorial well fitting the scene. It is a rude board, with a cross painted on it, and this inscription—

MARIA GAGER,

66 years old;

Perished on the Cliff over against the Reader,

On the 27th September.

Found on 5th October, 1834.

The poor old woman had been gathering wood, and fell down the precipice amongst the trees, so that her body was not found without a long and painful search.

Beneath the sign of the cross are a few of those rude but plaintive lines which one continually meets with on such mementos in Germany, and which speak powerfully the poetic temperament of the people.

They run something to this effect:—

"While God me leadeth, keep I true,
In faith and hope my suffering heart;
Whilst his great powers my sin subdue,
What shall me from him part?
In patience I my soul maintain.
What God gives me of woe and pain,
Is ever granted for my gain."

POPULAR YEAR-BOOK.

June.

JUNE was named by Romulus either from the Pagan goddess Juno, in honour of whom a festival was celebrated in this month, or out of compliment to the junior or inferior branch of the Roman senate. Mercury was regarded by the old Romans as the deity who presided over June. The Saxons called it *weyd-monat*, because the beasts did then weyd, or go to feed in the meadows, *wold* or weed-month, and *seve-monat*, or dry-month. It was represented by the ancients as a young man clothed in a mantle of dark grass-green colour, having his head ornamented with a coronet of *bents*, *king-cobs*, and *maiden-hair*, bearing on his arm a basket of summer fruits; and holding in his left-hand an eagle. In his right he held the sign *Cancer*, the *Crab*, "which," says Brady, the sun entering on the 22d, makes the summer solstice; and that orb, being then apparently stationary, but about to recede, is aptly typified by a crab, whose motions are either sideways or retrograde; and, in that eccentricity of motion differs from all other animals."

Summer begins in June; which is really in this climate what the poets represent May to be—the most lovely month in the year. "The hopes of Spring," observes a writer on the Seasons, "are realized, yet the

enjoyment is but commenced; we have all Summer before us; the cuckoo's two notes are now at what may be called their ripest,—deep and loud; so is the hum of the bee; little clouds lie in lumps of silver about the sky, and sometimes fall to complete the growth of the herbage; yet we may now lie down on the grass, or the flowering banks, to read or write. . . . At night, the moon looks silveriest; the sky at once darkest and clearest, and you may hear the undried brooks of the spring running and panting through their leafy channels."

Towards the end of this month, the birds are busily occupied finding food for their young, and become almost silent. The cuckoo's note ceases; and the lark, blackbird, stone-curlew, and golden-crested wren are only occasionally heard. Swallows are only absent from their nests for half a minute at a time, and yet return loaded with insects, of which great numbers are now on the wing. The barn-owl may be seen in the mild evenings gliding along hedge-rows; and now and then pouncing upon a mouse. The bat and owl also venture forth, flitting through the glimmering quiet. Grasshoppers click in the warming verdure. Butterflies, beetles, flies, and fern-chaffers abound. The anglers' May-fly, which only lives five or six hours, appears for about a fortnight at the beginning of June; and wasps make their nests in this month. The trees are now in their fullest garniture, and the fields in hedges in full blossom with the clover, the still more exquisite bean, the blue and yellow nightshade, the fox-glove, the mallow, poppy, corn-cockle, water-iris, catch-fly, bind-weed, ragged-robin, thyme, white briony, wild honeysuckle, and the flower of the hip or wild rose, which blushes through all the gradations of delicate white and red. The leaves of the hip, especially the young ones, are as beautiful as those of any garden rose. In addition to the flowers of May, the parterre beams with the jasmine, golden-rod, larkspur, sunflowers, amarynths, lupins, carnations, Chinese-pinks, hollyhocks, ladies'-slippers, campanulas or little bells, maragons, periwinkles, lilies, sweet-williams, poppies, roses, snapdragons, nasturtiums, chrysanthemums, convolvuluses, &c. The farmer is now fully employed. Turnips are to be sown, old pastures to be cleared, and young corn to be weeded. But the rural business of this month chiefly consists of two occupations, as beautiful to behold as they are useful,—sheep-shearing and hay-making. Something like a holiday is still made of the former, and in the south-west of England the custom, we believe, is still observed, of throwing flowers into the streams,—an evident relic of paganism. The season for sheep-shearing begins as soon as the warm weather is so far settled, that the sheep may without danger lay aside a great part of their clothing. The latter part of June is the commencement of hay-harvest for the southern and middle parts of the kingdom. This is one of the busiest and most agreeable of rustic employments. Both sexes and all ages are engaged in it. The sweetness of the new-mown grass, the gaiety of all surrounding objects, and the genial heat of the temperature, all combine to render it a period of delight. There is not much work for the gardener in June, beyond weeding, watering plants, and removing insects. Fruits are ripening, and young potatoes fit for the table.

Romulus assigned to this month thirty days, though in the old Latin, or Alban kalendar, it consisted of twenty-six only. Numa deprived it of one day, which was restored by Julius Cæsar; since whose reign it has remained undisturbed.

June 1 & 2.—~~Whitsunday~~ Monday and Tuesday, (1846.)

These holidays have been kept from a remote period; and, as before the Reformation, are solemnly observed by the Church of England. In very laborious trades, the ancient law of France required the workmen to rest during twelve days after Christmas, twelve days after Easter, and twelve days after Whitsuntide. And now,

for this third great festival of Christendom, were the gates of each castle hall, and of each royal palace, thrown open to every visitant; and again might every one, however high, or however low, partake the profuse though rude hospitality of the "*Cour plénière*." The feast of Whitsuntide was always celebrated by the Conqueror and his immediate descendants at Westminster; and though held for a shorter time, yet it seems to have fully equalled the Christmas feast, both in splendour and importance. In earlier days, tournaments, as at Easter, were the favourite amusements of the period; but, from the close of the thirteenth century, a new, and, to our wondering forefathers, a most fascinating species of entertainment almost superseded them: these were the MIRACLE PLAYS, or MYSTERIES. The origin of these earliest modern attempts at dramatic composition is involved in obscurity. They seem not to have been known in England until the time of Edward I., and one bearing that date is extant among the Harleian MSS. The date of the Chester plays has been found to be about 1328, and the Coventry plays are supposed to be about the same period. The English Miracle plays appear to have been the result of the laudable endeavour of some of the ecclesiastics, at the time when the English language had completed its transition from the Saxon, to render the great mass of the people acquainted with the general outline and most interesting events of Scripture history.

After holding their high station in popular estimation for nearly four centuries, the miracle plays, from the period of the Reformation, rapidly declined. They, however, did not fall finally into disuse until the commencement of the seventeenth century.

At this season the CHURCH or WHITSUN ALES were formerly celebrated. These were derived from the *Agapæ*, or love-feasts of the early Christians; and were so called from the churchwardens buying, and laying in from presents also, a large quantity of malt, which they brewed into beer and sold out in the Church or elsewhere. The profits, as well as those derived from the games, &c., (there being then no poor-rates), were in part given in charity, "according to the Christian rule, that all festivities should be rendered innocent by alms;" and in part devoted to defray the repairs and decorations of the Church, and the expenses attendant upon the celebration of divine service. Aubrey thus describes a Whitsun Ale: "In every parish is (or was) a Church-house, to which belonged spits, crocks, and other utensils for dressing provision. Here the housekeepers met and were merry, and gave their charity. The young people were there, too, and had dancing, bowling, shooting at butts, &c., the ancients sitting gravely by, and looking on. All things were civil and without scandal." "It seems also," says Hone, "that a tree was erected by the Church door, where a banner was placed, and maidens stood gathering contributions. An arbour, called Robin Hood's bower, was likewise put up in the church-yard." According to Douce, the modern Whitsun Ale consists of "a lord and lady of the ale, a steward, sword-bearer, purse-bearer, mace-bearer, with their several badges, or ensigns of office; train-bearer, or page: fool, dressed in a party-coloured jacket; and pipe and tabor man, with a company of youths and maidens, who dance in a barn."

The Whitsun Ales have been, in many places, superseded by the love-feasts of the Friendly Societies. Both men and women belong to these clubs, in which every member pays a certain weekly or monthly sum, and on occasions of sickness or misfortune, claims a weekly stipend, or a sum of money to bury their dead. They were, and are, often the poor man's sole resource and refuge against the horror of falling on the parish, and have helped him through his time of affliction without burthening his mind with a sense of shame and dependence. An eye-witness has given a pleasing description of the rural festival of these societies. On Whit-Monday, he remarks, the sun-shiny morning has broke

over the villages of England with its most holiday smile. All work has ceased; groups of men have met here and there in the streets in quiet talk: the children have begun to play, and make their shrill voices heard through the hamlets. There have been stalls of sweetmeats and toys set out in the little market-place, on the green, by the shady-walk, or under the well-known tree. Suddenly the bells have struck up a joyous peal, and a spirit of delight is diffused all over the rustic place, ay, all over every rustic place in merry England. Forth comes streaming from their club-room, at the village ale-house, the procession of hardy men, or comely women, all arrayed in their best, gay with scarfs and ribands. In front of them marches one bearing the great banner, emblazoned with some fitting scene and motto. There it floats its length of blue and yellow, and on its top nods the large poey of peonies, laburnum flower, and lilacs. Then comes sounding the band of drums, bassoons, hautboys, flutes, and clarionets. Then the honorary members—the frecholders of the place—the apothecary, and the priest—and the simple sons of the hamlet walking as stately and as gravely as they can for the nods and smiles of all their neighbours, who do not join in the procession, but are all at door and window to see them pass by. There they go, passing down the shady lane, with all the village children at their heels, to the next hamlet half a mile off, which furnishes members to the club, and must, therefore, witness their glory. Now the banner and the gilded tops of their wands are seen glancing between the hedge-row trees; their music comes merrily up the hill, and as it dies away at the next turn, the drumming of distant villages becomes audible in half a dozen different quarters. Then come one after another the clubs of the neighbouring hamlets, "sounding through the town." The women's clubs, in some places, parade on the same day with those of the men, but more commonly on Whit-Tuesday. In some places they are graced with the presence of some of the ladies of the neighbourhood, who are honorary members. Their light dresses, their gay ribands and bonnets, their happy, and often very handsome, faces, cannot be seen without feeling with Wordsworth, that—"their beauty makes you glad." "In all the pageants and processions," writes Mr. Howitt, "that were ever seen, there is nothing more beautiful than those light wands with which they walk, each crowned with a nosegay of fresh flowers. As I have met these Whitsuntide processions in the retired villages of Staffordshire, or, as I saw them in the summer of 1835, at Warsop, in Nottinghamshire, I would wish to see them as many years hence as I may live. If we are to retain any rustic festival at all, we cannot, I think, have a more picturesque one, or at a pleasanter time." The Whitsuntide holidays are kept by Londoners as generally, and in the same manner, as those at Easter. At Lichfield, on Whit-Monday, an annual fair for the exhibition of shows is held, at which it is the custom for a procession, (accompanied with musicians and flags) to be formed, composed of part of the Corporation, with its inferior officers, &c., who are joined by several of the best mechanics of the place, each of whom carries a representation, in miniature, of his separate workshop, and mode of trade, the figures being so formed as to be put in motion by machinery, and worked by a single wheel. The procession walks from the Guildhall to an eminence in the vicinity of the city, called Greenhill, where a temporary booth is previously erected, and decorated with flowers, and a small space of ground enclosed at the front with boards. On the arrival of the procession at this spot, the gates of the enclosure are opened, it enters, and the little machines are placed around it, and set in motion by their respective owners, in the presence of the higher portion of the Corporation, by whom prizes are given to the most ingenious. This takes place about the middle of the day; the exhibition of the miniature representations

continues till the evening. The booth is filled with refreshments; care is taken to preserve order; and cakes are distributed among the spectators at the expense of the Corporation. Till within the last century, an old usage prevailed in the parish of Ensham, Oxfordshire, by which the town's people were allowed on Whit-Monday to cut down and carry away as much timber as could be drawn by men's hands into the abbey-yard, the Churchwardens previously marking out such timbers by giving the first chop; so much as they could carry out again, notwithstanding the opposition of the servants of the abbey to prevent it, they were to keep for the reparation of the Church. By this service they held their right of commonage at Lammas and Michaelmas. On Whit-Tuesday the "Montem" is triennially held at Eton; but as this celebration formerly took place in December, and appears to be a corruption of the puerile solemnities anciently observed on St. Nicholas' day, we shall describe it in our notice of that festival.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

ORIGIN OF FRANKING LETTERS.

In the 23rd volume of the Parliamentary History, is the following very curious anecdote concerning this privilege. It occurred in the debate on the Post-office Bill, in the year 1660. "Colonel Titus reported the Bill for the settlement of the Post Office, with the amendments. Sir Walter Earle delivered a proviso for the letters of all Members of Parliament to go free, *during their sittings*. Sir Heneage Finch said 'It was a poor mendicant proviso, and below the honor of the house.' Mr. Prynne spoke also against the proviso; Mr. Bunckley, Mr. Boscawen, Sir George Downing, and Serjeant Charlton, for it; the latter saying, 'The Council's letters went free.' The question being called for, the Speaker, Sir Harbottle Grimstone, was unwilling to put it; saying he was ashamed of it; nevertheless, the proviso was carried, and made part of the Bill which was ordered to be engrossed.

"The Lords subsequently disagreed to this proviso, and it was ultimately thrown out. At a subsequent period, however, both houses did not feel it below their honour, to secure for themselves this exemption from postage."

THE QUEEN AND THE QUAKERESS.

In the autumn of 1818 her late Majesty, Queen Charlotte, visited Bath, accompanied by the Princess Elizabeth. The waters soon effected such a respite from pain in the royal patient, that she purposed an excursion to a park of some celebrity in the neighbourhood, then the estate of a rich widow, belonging to the Society of Friends. Notice was given of the Queen's intention, and a message returned that she should be welcome. Our illustrious traveller had, perhaps, never before held any personal intercourse with a member of the persuasion, whose votaries never voluntarily paid taxes to "the man George, called King by the vain ones." The lady and gentleman who were to attend the august visitants had but feeble ideas of the reception to be expected. It was supposed that the quaker would at least say, "*Thy Majesty*," "*Thy Highness*" or "*Madam*." The royal carriage arrived at the lodge of the park punctually at the appointed hour. No preparations appeared to have been made; no hostess, nor domestics, stood ready to greet the guests. The porter's bell was rung; he stepped forth deliberately with his broad-brimmed beaver on; and unbendingly ac-

costed the lord in waiting with, "What's thy will friend?" This was almost unanswerable. "Surely," said the nobleman, "your lady is aware that her Majesty—Go to your mistress, and say the Queen is here." "No, truly," answered the man, "it needeth not; I have no mistress nor lady; but friend Rachel Mills expecteth *thine*. Walk in!"

The Queen and the Princess were handed out, and walked up the avenue. At the door of the house stood the plainly attired Rachel, who, without even a curtsy, but with a cheerful nod, said, "How's thee do, friend? I am glad to see thee, and thy daughter. I wish thee well! Rest and refresh thee and thy people, before I shew thee my grounds."

What could be said to such a person? Some condescensions were attempted, implying that her Majesty came not only to view the park, but to testify her esteem for the Society to which Mistress Mills belonged. Cool and unawed, she answered, "Yea, thou art right there. The Friends are well thought of by most folks, but they need not the praise of the world; for the rest, many strangers gratify their curiosity by going over this place, and it is my custom to conduct them myself; therefore I shall do the like by thee, friend Charlotte! Moreover, I think well of thee as a dutiful wife and mother. Thou hast had thy trials, and so had thy good partner. I wish thy grandchild well through hers." (She alluded to the Princess Charlotte.) It was so evident that the Friend meant kindly, nay respectfully, that offence could not be taken. She escorted her guest through her estate. The Princess Elizabeth noticed in the hen-house a breed of poultry hitherto unknown to her, and expressed a wish to possess some of these rare fowls; imagining that Mrs. Mills would regard her wish as a law; but the quakeress merely remarked, with characteristic evasion, "They are rare, as thou sayest; but, if any are to be purchased in this land or in other countries, I know few women likelier than thyself to procure them with ease."

Her royal highness more plainly expressed her desire to purchase some of those she now beheld. "I do not buy and sell," answered Rachel Mills. "Perhaps you will *give* me a pair," persevered the princess, with a conciliating smile. "Nay, verily," replied Rachel, "I have refused many friends; and that which I denied to mine own kinswoman, Martha Ash, it becometh me not to grant to any. We have long had it to say that these birds belonged only to our house; and I can make no exception in thy favour."

This is a fact.

"I ALWAYS take it for granted," says Archbishop Tillotson, "that no one is ever angry with his adversary but for want of a better argument to support his cause."

Narrowness of mind is frequently the cause of obstinacy; we do not easily believe beyond what we see.—*Rochefoucault*.

Use not evasions when called upon to do a good thing, nor excuses when you are reproached for doing a bad one.—*Lavater*.

PASS OF LLANBERRIS.

SNOWDONIA.

THE county of Caernarvon, from Bardsey Island, in a north-easterly direction to the promontory of Penmaenbach in Conway bay, is occupied by an immense group of mountains, amongst which are some of the highest summits in Wales. The hills rise gradually from both extremities of the range to the centre, where the monarch Snowdon sits enthroned, surrounded by his subject heights. This district comprises some of the grandest scenery in Britain, combined with some of the loveliest. "Nature," says old Camden, "has here reared huge groups of mountains, as if she intended to bind the island fast to the bowels of the earth, and make a safe retreat for the Britons in time of war. For here are so many crags and rocks, so many wooded valleys rendered impassable by so many lakes, that the lightest troops, much less an army, could never find their way among them. These mountains may be truly called the British Alps; for, besides that they are the highest in the whole island, they are like the Alps, bespread with broken crags on every side, all surrounding one which, towering in the centre far above the rest, lifts its head so loftily as if it meant not only to threaten but to thrust it into the sky." The historian has made one incorrect assertion here, for there are at least eight Scottish mountains higher than Snowdon. The beauties of nature in North Wales are so numerous, and so widely

known, that a large tide of tourists arrives with the fine weather of each year to ramble amongst its vales, and climb its hills. The district of Snowdonia is eminently attractive, and the ascent of the Nivose mountain is one of those feats that yield a large amount of present and retrospective pleasure to the Rambler.

For the present, however, we forbear saying anything about the ascent, or the view from the summit. An inspection of the map will show that there are two roads which leave Caernarvon, and proceed inland, on opposite sides of Snowdon. One of them crosses the pass of Llanberris to Capel Curig, and the other goes through Bettws and Beddgelert to Tremadoc. A third road, passing underneath the eastern side of Snowdon, effects the junction of the other two. Thus the stranger has an opportunity of viewing the loftiest mountain in Wales on all sides, before making its more intimate acquaintance by visiting its summit. The route is about thirty-six miles in length, and, as it lies through scenery of the highest interest, we propose to conduct our readers along it. Starting then from the ancient town of Caernarvon, we reach, in a short time, the extremity of the longest of the Llanberris lakes. This sheet of water is not more than a mile and a half in length, being fed by a stream called the Rythel issuing from the upper lake. The upper sheet of water is scarcely a mile long; but it is said to be of the extraordinary depth of 140 yards.

If this be so, the bottom must be some fathoms below the level of the sea. It is seldom known to be entirely frozen over, owing, probably, to its great depth in proportion to its extent of surface—the whole mass of water not being reduced through the winter to that degree of temperature which allows the formation of ice on the surface. On an eminence between the two lakes, but close upon the lower one, are the remains of Dôlbadarn Castle, the date of whose erection is lost in the mist of ages, for it is uncertain whether it was before or after the Norman conquest. The name signifies Padarn's meadow, it being supposed that a British saint, called Padarn, is referred to. Each of the five narrow passes conducting from the interior to the coast were guarded in ancient times by a castle, and this fortress stood in the central pass. A defence of this kind was then of great importance, since it was impossible for an enemy to pass over the chain of hills which fortify Caernarvonshire and Anglesey. The only remains of the original edifice consist of the foundations of the exterior buildings, and the greater part of the citadel, or keep: this is a circular structure, thirty feet in diameter, and seventy-five feet high. Its shape reminds the Rhine tourist of the Castle of Godesberg, whose cylindrical Donjon Tower, perched upon the top of a pointed rock, commands one of the finest views on that majestic river. It contains four apartments, one over the other, the dungeon being the lowest: they are connected by a spiral staircase. This appears to have formed the chief portion of the entire fortress; but, though of small extent, it was a strong place; a dozen men would almost have sufficed to stock it; and altogether it was scarcely larger than one of the bastions of Caernarvon castle. This smallness of size, combined with the rudeness of the architecture, has led most people to conclude that it was a British fortalice much more ancient than the first William's visit to this country. It has been in a state of decay for several centuries. So far back as Henry the Eighth's time, Leland described it as a decayed tower. Here Owen Gôch languished a prisoner for twenty years, as a punishment for having joined in a conspiracy to dethrone his brother, Llewellyn ap Gruffydd, the last native Prince of Wales. The views from this place are strikingly beautiful. The two lakes are seen in their full extent, surrounded by a vast amphitheatre of mountains. Nor can there, we think, be anything more impressive than a mouldering tower by the side of a crystal lake. In the first place, there is something eminently stimulative to the imagination in the sight of any great work of man, having its origin in some remote region of time, and now fast hastening to decay. Then how fondly do we seem to perceive a sympathy on the part of Nature with us and ours, in taking back to her bosom some object of our creation! And when we behold her unobtrusive wishes and silent operations, do we not look upon her beauties with a warmer admiration through the colouring of a human intellect? Another chord of feeling is touched by the contrast between man's frail workmanship, having in it from the beginning the seeds of decay, and Nature's unfading perennial freshness. The castled crag of Dôlbadarn with its tottering tower may, it is true, arouse in us only sentiments similar to those excited by a thousand ruins in this island or on the continent; yet time, place, and circumstance vary and distinguish every one of them; nor shall any frequency of such scenes induce us to think lightly of those combined feelings of awe, reverence, and sadness, with which we ought ever to behold the sanctifying agencies of Time and Nature.

On the declivity of a mountain called Allt Ddô, or the Dark Cliff, immediately facing the castle, are considerable quarries of purple slate, the property of Lord Penrhyn. The excavated material is conveyed from the quarry by a railroad formed for the purpose, to Port Penrhyn, near Bangor. In the same neighbourhood there is a valuable copper mine. Half a mile south of the castle, at the termination of a deep glen,

a tremendous cataract, called Caunant Mawr, thunders over a ledge of rock sixty feet in height. The name signifies the waterfall of the great chasm: the waters are those of the mountain torrent from Cwm Brwynog: they are first seen to rush through a cleft in the rock above, and, after coming straight forward for a short distance, make a sudden bend, and then fall in a slanting direction into the black pool below. There is a want of wood about the spot, but it deserves the visit of every Rambler. Six miles from Caernarvon, and not far from Dôlbadarn Tower, is the Victoria Inn, a large and commodious establishment of recent erection. It forms a most convenient station for visiting the adjacent scenery; and the ascent of Snowdon is frequently commenced here. At the village of Llanberris, we enter the wild and desolate vale of Nantperis, pent in by lofty rocks, at the base of which stones of every size and shape are scattered. Then pushing upwards, "doubling and doubling by laborious walk," we attain the summit of the pass; and, as we rest after the exertion, we may call to mind, in connexion with the name of the spot (Gor-phwysfa, or, *the resting-place*), the admonition carved on a stone at the top of a wild pass in Scotland (Glen-croë). "Rest, and be thankful," says the inscription; and

"Who that has gained at length the wished-for height,
The brief, the simple way-side call can slight
And rest not thankful?"

Proceeding, the tourist passes another fall of water called Ffynnon Lâs, made by a stream that runs from an upland lake of the same name: the words, being interpreted, mean *The Green Well*. Soon afterwards, the road enters the one from Beddgelert to Capel Curig (pronounced Cerrig). The latter little town is situated near the point where a stream flows into the Llugwy. A fine cascade called Rhaeadr-y-Wenol (the Swallow's Waterfall),

"With woods o'erhung, and shag'd with mossy rocks,"

is in the vicinity. The water comes to the edge of the precipice in one sheet; but jutting rocks and fretting stones soon break it into many streams that dash impetuously downwards through a chasm which, at the widest part has a breadth of sixty feet. There is great luxuriance of vegetation around this cascade; and the noble forms of rock on either side contribute to make this one of the finest scenes of the kind in Wales. By a change of position the visitor may obtain many pleasing variations of prospect; and we may notice, that, from the upper part of the wood, near the head of the cascade, there is a good view of the descending waters. Any one who has seen Lowdore, in Cumberland, will be reminded of that famed waterfall by Rhaeadr-y-Wenol. Having gazed our fill at this beautiful spectacle, we may turn back and proceed to Beddgelert, but it may be proper to add that the deviation to Capel Curig has added six miles to the distance we before gave. The next valley we enter is Nant Gwynant, (the vale of waters,) so called, like Lanterbrunn in the Bernese Oberland, from the number of streams in it. On the right hand, near the head of the vale, is another waterfall (for hereabouts the cascades are nearly as plentiful as blackberries) called Rhaeadr-cwm-dyli, and a little further down the valley are two huge fragments of rock, which attract attention by their hugeness; one of them, resembling in shape the gable end of a house, far exceeds in size the celebrated Bowder Stone in Borrowdale. The tourist next perceives that this romantic valley is enriched by two lakes. The upper one, Llyn Gwynant, three quarters of a mile in length, occupies all the level area of the vale, except what suffices for the road. The scenery around its shores is very grand. Y Aran towers conspicuously on the right, and close by is a hollow of graceful outline, denominated Cwm Llan, which extends towards Snowdon. The summit of that mountain is here finely visible between the intervening

hills. At the foot of the Lake (or Tarn,¹ as it would be called in the north of England) the mountains converge, and the traveller is admitted through a narrow opening into the next chamber of the valley in which the second lake, Llyn-y-Dinas, is placed. In the vicinity a lofty rock is pointed out, to which Vortigern is said to have retreated from the persecution of his subjects, and the remains of a building on the summit is referred to in confirmation of the statement. The village of Bedd-gelert is most romantically seated on a beautiful tract of meadow ground near the conflux of the Colwyn and the Glas Llyn. Three vales diverge from this place, through one of which lies the road to Tremadoc. If you inquire the meaning of the name of the village, the following tradition, which has been versified more than once, is related. Prince Llewellyn, (whose reign began in 1194,) had a hunting seat at this place. On returning one day from a hunting excursion, Llewellyn was met at the door of his house by his favourite dog, Gelert, who had been unaccountably absent from the chase, in which his fleetness and sagacity had been much missed. The dog was stained with blood and gore; and upon seeing his master, began his usual caresses. The Prince, however, was alarmed at the sight on account of his infant, and heedless of the dog's behaviour, he rushed into the room where the child slept. The bed-clothes were tossed about and bloody, but the child was not visible. In an agony of sorrow and passion, Llewellyn drew his words and plunged it through the hound, supposing the animal had killed his son. The dying yelp of the dog

awoke the infant, who had been concealed under the clothes; and these being removed, not only was the blooming child discovered safe and sound, but the dead body of a gaunt wolf torn with wounds inflicted by the fangs of the faithful Gelert was there also. Stung with remorse, the Prince erected a tomb over the animal, which he named Bedd-Gelert—Gelert's Grave. He also founded a monastery for the good of his own soul, and as a grateful offering to Providence for the preservation of his child. Quitting Beddgelert for Caernarvon, we enter a pleasing valley, which gradually expands as we advance. It is watered by the Colwyn, a stream which has its origin in a lake called Llyn-y-Cader. Upon the right, nearly opposite this lake, the ascent of Snowdon is usually commenced from this side, the distance from the road to the top being about four miles. The road then passes along the shore of a lovely little sheet of water, called Llyn Cwellyn, lying at the foot of a crescent-shaped precipice, part of which, called the Wolf's Castle, seems to overhang its base, and forms a very striking feature in the landscape. On the banks of this lake the guide to Snowdon resides in a small public-house, where he keeps ponies and all things necessary for making the ascent. A narrow valley strikes off to the left, containing two small lakes, in one of which there is a floating island, and hence called the Lake of the Sod. If the tourist has time, we recommend him by all means to pay these lakes a visit, as they are surrounded by very fine scenery. Proceeding, however, directly to Caernarvon, he will see a cascade formed by the Fai Issa, the stream which issues from Llyn Cwellyn. The vale has now broadened into meadows, and hereabouts is Nant Mill, a picturesque spot, which has irresistibly drawn out many a sketcher's portfolio and pencil. We soon afterwards reach the village of Bettws. The country through which the road now proceeds forms a succession of rises and dips; the soil is rocky, but not unproductive. The high grounds in Anglesey begin to appear, and from one of the elevations in the road the whole island is seen spread out like a map before the eye. Immediately afterwards we re-enter Caernarvon, from which we started in the morning, a little jaded and worn, but highly delighted, as every one must be, with the magnificent scenery through which we have toiled.

(1) Having spoken of lakes, (says Mr. Wordsworth, in his delightful Essay on the Lake Scenery), I must not omit to mention, as a kindred feature of this country, those bodies of still water called *tarns*. They are found in some of the vales, and are numerous upon the mountains. A tarn in a *vale* implies, for the most part, that the bed of the vale is not happily formed; that the water of the brooks can neither wholly escape, nor diffuse itself over a large area; accordingly, in such situations, tarns are often surrounded by an unsightly tract of boggy ground; but this is not always the case, and in the cultivated parts of the country, when the shores of the tarn are determined, it differs only from the lake in being smaller, and in belonging mostly to a smaller valley or circular recess.

SNOWDON.

AN ADVENTURE IN THE THREE KINGS DURING THE RIFLE-MEETING AT BASLE.

INTRODUCTION.

AND whilst the weathercocks are creaking, and the evening wind blustering over the little inn in the Black Forest, the three guests, assembled in the landlord's room, call to mind their departed friend and boon companion.

"On this very day twelvemonth," said the chaplain, "I buried him."

"On the very day of his burial," said the doctor, "I took up my quarters here."

"Twelve months to-day," said the shopkeeper, "as soon as the funeral was over, I set off for Geneva; a great chance it is if ever I go there again."

"Ah, dear Switzerland!" said the churchman, with a sigh, "how dearly have I ever longed to see it! and yet, something has always thwarted my purpose. The beautiful student and holiday time is gone for ever; and I have never yet set foot beyond Appenzell."

"Of all the towns in the Swiss league, I never yet saw any but Basle," returned the doctor; "I was there at the great rifle muster."

"How strange!" cried Matzendorf, "I was there at the very same time. What a pity we were not acquainted then, dear doctor! those were happy days. The remembrance of them still flits before me, like some grand and chequered creation of the painter's pencil. To be sure, I had like to have made a sorry piece of business of it at the time, but fortune stood true to me and protected me."

"How so?" inquired his auditors.

"It is a tale of adventure," replied the dealer, "and, if you like, I will relate it. It is not so very long, though it might sound somewhat better in a romance."

"Out with it!" eagerly cried the doctor and the chaplain. The woodcutter, who had seated himself as a privileged listener near the stove, crossed his legs delightedly, and, taking a copious pinch from his wooden snuff-box, "his life upon it, the woodcutter is fond of stories," cried he: and the tradesman began the history of his

ADVENTURE IN THE THREE KINGS DURING THE RIFLE-MEETING AT BASLE.

I arrived in Basle about a week before the commencement of the grand general rifle-meeting of the Swiss Confederacy, having to transact important business, that admitted of no delay, and yet made a great demand on my time. I put up at the sign of "The Three Kings." In the other inns, "The Wild Man," or "The Stork," where tradespeople usually chose their quarters, there was not a room to be had.

Whilst sitting one afternoon in a coffee-house, with the friend with whom I had business, he informed me that the Prefecture of Police in Paris had despatched a notice to the Police of Basle, which, waiving the official style of the original, might run as follows:—

"Beloved Cousin,—The particular kindness which we feel for our friends in Switzerland prompts us to tender you information of a scheme concerted by some of our most dextrous scamps and cut-purses; to wit, of availing themselves of the grand rifle-muster among you for the purpose of stealing whatever they can lay hands on. The *élite* of the aforesaid guild will arrive at Basle a few days before the opening of the fête, and, as we are led to believe, in the most varied disguises. Some will drive in, post, in their carriages and six, but a far greater number will come by rail and omnibus. A certain Claude Barrault is reported to be the soul of the plot; though it is very improbable he will present himself under this name.

We enclose his *hue* and *token*; and hereby, beloved cousin, we deem ourselves to have given you sufficient warning, and remain

"Your devoted kinsman and well-wisher,

"PREFECTURA."

Its little cousin of Basle lent good heed to this information, but within the first eight-and-forty hours the mass of people that thronged to the fête increased to such an extent, that there was no longer any possible chance of keeping close watch over the strangers. The poor police-force had to be everywhere, without making any great manifestation of itself anywhere. If the former task proved too much for it, it succeeded to a miracle with the latter; and considerable thefts were effected in one place or other before the fête had begun. The officers had enough to do to find accommodation for the throng of marksmen and other visitors. On the very first evening there were thousands of the former without shelter of any sort, who at last had to turn right and left, and put their heads into the best hole they could. Many a stranger had to pay five francs for his bed in the close and ill-appointed domicile of some needy townsman; and then, far from having it to himself, he would perhaps have to share it with one, and not unfrequently two companions, of whom all that he knew was that they paid as much as himself. Little did I think that a similar fate awaited me in the large new hotel of "The Three Kings;" and that there I should have to sleep under the same roof, and in the same room, with a most ferocious-looking stranger. However, such was my lot. For, lo and behold! on the very first evening, after many people had turned into their quarters by the flare of torches, and beat of drum, the waiter of the story I slept upon thrust a *gent* into my chamber, who carried a short gun and a small travelling-bag, and, hastily throwing up a camp-bedstead opposite mine,

"Only for to-night, sir," added he, in a cool yet civil tone. "To-morrow we will mend the matter."

A stranger, with gun and knapsack! And there I lay, unarmed, and, as a matter of course, completely undressed; with my travelling chest under my bed full of gold and silver watches from Geneva and Neuchâtel; my own repeater hanging over my pillow; look, my friends, here it is, going *tick, tick*, indifferently as it then did to my heart's disquieted throbbing; while on the table at my bed-side lay my purse and pocket-book, neither of which were empty!! The tradesman that travels every year to fairs and the like meetings, learns prudence as well as mistrust on his way.

Whilst the bed was being put up, the servants running this way and that, and the stranger impatiently striding up and down the room, I managed to spirit away the repeater, the pocket-book, and the purse into bed with me, and became somewhat more composed. My chest, as I said before, was out of sight. The waiter and his train had scarcely finished their business and retired, when the stranger took his stand beside my bed, and, making me a low bow, expressed to me in French how sorry he was to be thus obliged to disturb me; nay, that he himself was quite on the brink of despair about it. I am little skilled in French, and but very poorly understood what he said, and so, when he came to a pause, I merely made answer by a nod of the head and a scanty "*Oui, oui*." But the Frenchman's politeness pleased me; and, upon the whole, it is quite true, that the "*Qu'est-ce que-dits*" give one the full idea of politeness when they are not absolutely inclined or obliged to be rude. This afforded me an opportunity of taking an exact survey of my fellow-lodger. He was a man of comely growth, and of the ordinary stature; he had long brown hair, wore both a moustache and beard, had a soft white face, and hands that were still whiter; while his pallid complexion lent a darker lustre to his eyes. On his head was a little grey rifle-cap; his body was enveloped in a common loose frock, made of light summer material; while his feet were sheathed in brown gaiters, with little mother-of-pearl buttons.

As the stranger saw that I got on but very indifferently with French, he tried his luck with German. He spoke the language badly and ludicrously enough, yet much better than I did his own.

"You will perhaps allow me," said he, "to smoke a cigar?"

"With pleasure," I replied.

When he had furnished himself with a light, "Now I will tell you who I am," he resumed, "that you may know who it is you have so suddenly fallen in with. I am a tradesman from St. Marie-aux-Mines, and my name is Claude Barrault. May I now make free to ask the favour of your name?"

I might as lief have told him I was Matz of Tripstrille, or the Little Dog of Bretten, for that matter, so staggered was I by the name he had given me. You will all remember the notice sent by the police-office in Paris. I was struck all of a heap, as it were; with difficulty I stammered out my own worthy name to the edification of the suspicious-looking interrogator, and sought to excuse this stammering as well as I could, by simulating an extraordinary fit of drowsiness. Hereupon my companion gave a polite "*Bon soir et bonne nuit, monsieur*," and withdrew to the neighbourhood of his bed.

But poor I! How was I to sleep? The ill-omened name of my fellow-sleeper set my brain in one continual whirl. I turned my face towards the wall, the better to compose myself and collect my thoughts. It would not do; for at that very moment the stranger stole towards my bed, like the pole-cat sneaking along to the hen-roost.

"Who's there?" cried I, pretending to start suddenly from sleep, and fixing on the fellow a chilling look of horror.

"Pardon me," said he, in a hurried voice, "I am only looking for a boot-jack;" and so saying, he stooped down, with the light in his hand, and plied his search underneath my bed much longer, I thought, than was necessary to find the implement in question.

Aha! thought I to myself, now he has seen your chest of watches; you are a marked man, sure enough: for who in the world, with gaiters on, would trouble his head about a boot-jack, if he were not an arrant rogue at heart?

But the truth of the matter was, that the fellow really had boots on; the gaiters over them were merely an idle make-believe, of which there are no lack now-a-days. But this was not the only interesting point about my gentleman.

What served in some measure to quiet my fears was, that he deposited a well-laden purse in the drawer of the night-table. It seemed to be full of gold; my ear is pretty well tuned to the sound of that metal. "Ah!" said I to myself, with some feeling of satisfaction, "he has money with him, and a good lot of it too! what gentleman on the high-road he has relieved of it I know not; however, it is a well-known fact that the glutton lion goes his way in peace. And it will be just the same, I guess, with knaves of his guild, for no man is spiteful by nature. Necessity, rather than opportunity, is the mother of theft."

Resigning myself to this sort of philosophy, I was really on the point of closing my weary eye-lids, after having commended myself to God and his protecting angels, when, poor fellow that I was, fated, as it seemed, to be cheated of repose, I heard a rustling and crackling near me; and half-opening my eyes, like some wily fox when the sun inconveniences him, I beheld, by dint of this crafty and involuntary peep, Claude Barrault standing at my bed-side, and scrutinizing my features. At that moment he turned away, mumbling contentedly to himself, "*Il dort*," which was good French, I take it, for the simpleton sleeps; whereupon he stole back on tip-toe to his couch, and—could I believe my eyes?—with one bold grasp tore all his beautiful long hair from his head. There he stood with a close-clipped woolly frizzly pole, round which he wound a silk handker-

chief, after the manner of his countrymen, and hid his wig.

"Ho! ho!" thought I, "I shall very much like to see what else is coming." And now for manipulation the second. He applied water lightly beneath his nose and on his chin, and lo, and behold! the mustachio and beard came clean off in a bunch, leaving nothing behind them but what is commonly called the *collier*. Now just imagine to yourselves, my friends, what this pattern of a man looked like: he had made himself quite a new face, without a single trace of his former physiognomy. 'A thorough scapegrace visage,' thought I; 'and yet in the spring of life withal.' The long hair had made him look at least ten, if not fifteen, years older. "So young, and yet so corrupt," said I, heaving a sigh from the bottom of my soul. Then he laid himself upon his bed, sighed once or twice himself, and uttering the name of Rosalie, not once or twice, but at least a dozen times;—whisk!—the light was out, and I saw nothing further.

The miscreant soon appeared to be asleep: for so young a man he had a considerable talent for snoring, which was in some measure an invitation to me to follow his example. I was grievously tired. The whole day long, from morning to evening, I had been hurrying about the town and the rifle-ground, and sleep would have been dearly welcome to me: despite of this, the most I could do was to get a little dose, and every moment I would wake up again, lying sentinel, so to speak, till dawn of day, when I said to myself, "Up now, and let the morning shine upon you; it will cheer your spirits, and your ill neighbourhood will be all the sooner renounced and got rid of."

No sooner said than done. I rose softly, and slipped on my clothes in silence. The Frenchman was still sleeping like a top, with his face turned towards me. All at once, in the midst of my hurry and skurry, my clasp-knife fell from its case; I caught at it and missed it, and it dropped on the ground. The iron made a jarring noise. My neighbour of the evil conscience awoke at the sound, shouting in my face, "*Qui va là?*" I had just answered "a friend," though in a tone of ill-humour, for I felt sorely concerned about my watches, and knew how foolish it would be to leave the thievish Frenchman alone with the case—when Monsieur collected his scattered senses, looked in the glass that hung opposite to him, and at once remembered to his dismay that he had peeled off his hair and beard. He struck his hands on his forehead, ejaculating "*Mon Dieu*" with a thrice-repeated sigh, and most assuredly felt in far less merry cue, than when invoking his Rosalie on the previous evening. Then poising himself on his elbow he turned towards me, and addressed me with the utmost possible show of frankness: "My dear sir," said he "I had reckoned upon awaking and finishing my toilet earlier than you, or you would not have surprised me in this singular transformation. You will be astonished, no doubt, and very rightly too, to see me looking just at this moment so very like a shaven monkey, but I was obliged to spare my peruke, and the beard that I had glued on my face kept my skin in intolerable tension. Weariness brought me too liberally the blessings of slumber; otherwise I should have been slow to give you such an opportunity, as you now have, of forming a curious conception of my person, my doings, and my dealings."

In order to increase his embarrassment, I replied dryly enough, that it was daylight now, and that there was nothing for him to fear for the present; besides, I had seen enough in the night.

He shook his head, shrugged his shoulders and went on as follows: "As you are now privy to a part of my secret, I will give you another little bit of it gratis, that you may make no mistake, or form a false opinion of me: I am here for the purpose of observing the movements of a certain lady, who is to visit the rifle-shooting with a family who are friends of hers, attended moreover by a certain gentleman. The said lady would

be my greatest blessing, and the said gentleman is my greatest bore, for he has a mind to marry her; and this I want to do myself. Do you understand me?"

I nodded, and smiled with an air of cunning, the better to show him that I did not believe a single word he said. However he continued his tale: "In my mask," said he, "I can follow the lady and her companions wherever they go, without the least fear of being recognised, and, in the chance of Rosalie proving true to me, I can calm my jealous heart, without either compromising my own dignity, or raising any delicate scruples in her mind. I entreat you not to spoil my pleasure, nor breathe a word of the matter to anybody. What can I be to you? Here we have met for the first time in our lives, and, when these festivities are over, we shall probably never meet again. Pray, do not betray me. Men like to do each other a kindness now and then, and you do not exactly look as if the fair sex were altogether hateful to you either."

I made no definite reply to his entreaties; neither with *Yes*, or *No*. I contented myself with saying: "Take care what you are after. There are sharp eyes enough in Basle; for my part, I will not give you any trouble. Allow me to ring and have my luggage removed; I will see if I can find another room."

He stared, and seemed to pout, I thought. "*Faites comme il vous plaira*," said he briskly, closing the curtains of his bed.

I rang the bell, and sent for Martin my coachman, the very same who is still in my service. I ordered him, above all things, to have the case of watches removed to my correspondent's house, with the request that it should be safely stowed. I would soon follow, I added, myself. After this I finished dressing, and, with my portmanteau in my hand, I went down stairs in search of the landlord. "You must be so good as to show me into another room," said I to him; "I cannot share my quarters with a second party, and besides you have put me too high up, and in an altogether inconvenient situation." With a host of apologies the civil landlord acceded to my request, unlocked the door of a chamber in the second floor, which had just fallen vacant, and assured me I should be subject to no further annoyance.

"The fact is," said he, "I would much rather give you the choice of this more comfortable apartment than offer it to the gentleman, (almost a perfect stranger to me,) whom I was thinking of putting into it to-day."

"You don't know who the gentleman is?" said I, unresolved whether or no I should out with my tale or not. On the one hand, I felt in duty bound to do so; but then, again, I am somewhat diffident by nature, and am slow to trust either my eyes or ears when any disagreeable affair is to be exposed; besides, I was not at all inclined to be thought a coward by the landlord, and to be laughed at for my good intentions. Just as he was answering, "I only know that he is a manufacturer from Markirch,"—the chance of the moment brings a crowd of Englishmen upon us, who gather like a cloud around our host, and threaten to pester him to death with their importunate jargon. Seeking refuge from this foreign multitude, I fly to the visitors' register:—the name of my last night's companion had not been entered. Well, being satisfied with the full assurance that my watches were safe, I issue forth from the hotel, and, following the general current, I arrive at the scene of festivity. It rained a little to be sure, but curiosity cares little about a wet jacket. I knocked at my friend's door on my way thither. The case had been duly delivered, and placed in safe keeping; my friend was not at home, having gone, like all the world, to the rifle meet.

It is altogether impossible, my friends, to give you a description of the scene of merriment. But stop—I remember you were there yourself, doctor, and recollect

as well as I do all the splendid things that surrounded us; the pagoda of the prizes, the tower of flags, the refreshment booths, the coffee-houses, the multitude of targets, the thousands of people,—some armed and some not, some wearing cockades, and some without them,—Frenchmen, Germans, Italians and Englishmen, in one immense and promiscuous medley. The report of the rifles and mortars, the smart stroke of the balls, nimble markers, incessant music, bright wine glistening in many hundred cups and flagons, festal speeches and clamorous kettle-drums, made one glad scene of noisy mirth. Every eye was lit up with delight: only two things were wanting to make the gala really beautiful; namely, fine weather and unanimity.

I just came up in time to see the brawl with the marksmen of the Valais, who had repaired to the rendezvous with the greatest confidence, but had met with a most unfriendly reception, for the unruly Swiss had even agreed in good earnest to storm the tower of flags, and tear down the Valaisan colours, the which outrage was only prevented by the intrepidity of the master of the gala, and other coercive means of every possible kind. But the most effectual remedy of all was that provided by the insidious strangers themselves, inasmuch as on the following day, without either shout or song, they withdrew from the scene of action with their rescued but ill-fated colours.

In the general hubbub and confusion I of course sought in vain for my friend. I however fell in with several of my acquaintance, and they gave me news of him. He had met a tradesman from Bellinzona, they told me, who had made him some proposals of business. Now, we all know very well, what tradesmen are. Talk to them of business, and they will listen to you even in church; and thus it was, that my friend and the dealer of Bellinzona had joined company, and retraced their steps towards the town. I diverted myself with the varied spectacle before me, and was even tempted to try a few shots, which I must confess, to the great amusement of the lookers-on, did not so much as hit the target.

"Shlood and thunder!" cries a man close at my side, "some knave of a fellow has stolen my pocket-book."

"And my snuff-box and handkerchief!" ejaculated an old tanner from Basle.

"Some scamp!" cried a third, "has torn my wife's shawl off her back and taken her gold chain along with it. But if I am not mistaken, there runs the thief. After him! after him! that man there in the light-coloured paletot!"

"What's the matter?" cried the gathering group of bystanders, and then, as they rushed in a body after the Buonaparte paletot, a thought comes like lightning across me, "Zounds, that is my last night's companion!" And true enough, there was his very hat and frock, and flowing peruke. Unfortunately they could not catch him, for he scampered off as fast as he could into the crowd that were levelling their abuse at the Valaisans, who stood their ground manfully, and would gladly have fallen foul upon the Tower of Flags. A detachment of troops, and a body of land-patrole and police were awaiting further orders, and it was feared that things would come to blows. Such, however, was happily not the case; but in the meanwhile the miscreant Barrault escaped.

As I too had my pocket-book with me, I made my way as quickly as I could out of the crowd, and returned to my hotel. The table was crowded, although on the rifle-ground itself the booths were all alive like an ants' nest. On my left sat an Englishwoman, of some forty years of age, with flaxen hair and a white waxen complexion. She might once have been a pretty creature, but her campaign was over, and yet she would have been glad enough to have seen me pay my court to her. I was pleased to find that my right-hand neighbour was a good sort of tractable and talkative Frenchman, who continually catered to my diversion, and

(1) A book in which the names, &c. of the visitors to the hotel are carefully entered, and submitted to the inspection of the Police.

amused me with all kinds of pretty stories. The theme of our conversation of course was the shooting-gala, and the crowds it brought together; and at last we came to talk of the number of thefts committed. Monsieur maintained there must be some hundreds of Parisian thieves on the spot, mentioning one or other of that respectable crew by name. I was astonished to find him so much at home on the subject. "No wonder," said he, (and he spoke German fluently,) "I myself hold an appointment under the Prefecture of Police in Paris, and the list of professional scamps is open to my free inspection. Moreover I know many of these fellows by sight, and, between ourselves, I am sent hither for the express purpose of keeping an eye on our Parisian off-scourings, and lending the guardians of the public safety a helping hand."

"Ah, is it possible!" cried I, quite delighted to hear such welcome intelligence.

"Hiat!" said the Parisian softly, giving me a friendly sign to be silent. "Am I not talking to you quite between ourselves? Pray, restrain your feelings. To be sure they know me very well at the Police Office, but in the town itself I wish to maintain my incognito. This aids my plan. Besides, even if fortune should nowhere prove favourable to me, yet, as true as I am Durand, the Secretary of the Prefecture of Police in Paris, I will venture my head upon it, that in this house at least the field shall remain clear, and not a single guest be robbed. I have taken measures accordingly."

"Excellent Monsieur Durand!" cried I, and a proud feeling of security stole over me, coupled with a strong inclination to bring a choice head of game—viz. M. Claude Barrault, to the roast of the Parisian official. But just as always happens with bashful, simple-minded fellows—at the very moment that I am opening my lips for the purpose, I look obliquely down the table, and, at the distance of about a half dozen covers from me, whom should my eye light upon but Barrault himself, with his mustachio and peruke on, and a coat of a darker hue in place of the whitish yellow paletot: he looked askance at me with a glance of terror, as though begging and entreating for mercy, and seemed dreadfully disquieted to find himself so near me. So then and there I feel sorry for the fellow, and cannot make up my mind to betray him; "let some one else do it," thought I, in German goodness of soul, when, patsch! and such a blow descended on my shoulder as threatened to shake my arm clean off. Turning round I beheld my friend and correspondent, who had stolen behind my chair to play off some of his Swiss jokes upon me. I rubbed my shoulder and gave him my hand. "Pardon me," said he to me, "for not being at home when you called to-day, but you know, a good tradesman never runs away from a little chance piece of luck, and to-day I have done business to the amount of eight hundred doubloons; wish me joy of it, and come along with me to the coffee-house! My time is short, and I should be very glad of a little chat with you, as you are to be off again to-morrow."

(To be continued.)

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. VII.

As we were preparing to take our departure, I observed the Captain exchange glances with Cumberland, who turned to Oaklands, saying, "Don't wait for me; I have one or two places to call at in my way back, and I shall only make you late;—when you get home, give Thomas a hint to keep back dinner five minutes or so,—old Mildman won't say anything about it, if he fancies it's the servant's fault."—To this Oaklands replied, "that it was rather a shame, but he'd see what he could do for once;" and, with a very distant bow to the Captain, we

left the room. As soon as we were in the street, Oaklands accosted me with, "Well, Frank, what do you think of billiards?" "Why," replied I, after a moment's thought, "as to the game itself, it's a very pretty game, and when one can play well, I have no doubt a very interesting one, too much so, perhaps." "Too interesting! why, that's the beauty of it; almost every other game is a bore, and tires one, because one does not get sufficiently interested to forget the trouble of it; what can you mean, by too interesting?" "You won't be angry at what I am going to say, will you?" said I, looking up in his face. "Angry with you, my dear boy? no fear of that; always say just what you think to me, and if it happens to be disagreeable, why it can't be helped; I would rather hear a disagreeable truth from a friend, any day, than have it left for an ill-natured person to bring out, when he wants to annoy me." "All I meant to say was this," I replied; "it seems to me that you get so much excited by the game, that you go on playing longer, and for higher stakes, than you intended to do when you began,—surely," continued I, "it cannot be right to lose such sums of money merely for amusement; is it not gambling?"

"I believe you are right, Frank," replied Oaklands, after a short pause, during which he had apparently been thinking the matter over; "when one comes to think seriously about it, it is a most unprofitable way of getting rid of one's money; you will scarcely credit it," continued he, half smiling, "but I declare to you I have been playing almost every day for the last two months." "So long as that?" interrupted I. "There or thereabouts," said Oaklands, laughing at the tone of horror in which I had spoken; "but I was going to say," he continued, "that till this moment, (looking upon it merely as an amusement, something to keep one from going to sleep over a newspaper in that vile reading-room, I have never taken the trouble to consider whether there was any right or wrong in the matter. I am very much obliged to you for the hint, Frank; I'll think it all over to-night, and see how much I owe Master Cumberland, and I'll tell you to-morrow what conclusion I have come to. I hate to do any thing in a hurry—even to think; one must take time even to do that well."

By this time we had reached home, and mindful of his promise, Oaklands begged Thomas to use his interest with the cook, for the purpose of postponing dinner for a few minutes, in order to give Cumberland a chance of being ready—to which Thomas replied, "Very well, sir, any thing to oblige you;" Mr. Oaklands muttering to himself as he went off, "wonder what that chap Cumberland is up to now: no good, I'll be bound." In another minute we heard his voice in the lower regions, exclaiming, "I say, Cook, mustn't dish up for the next ten minutes; Master ain't quite finished his next Sunday's sermon—he's got hitched just at thirdly and lastly, and mustn't be disturbed on no account;"—which produced from that functionary the following pathetic rejoinder:—"There, it's all up with the pigeon pie, for it will be burnt as black as my shoe by that time!"

As I was going down stairs, ready to go out, the next day, Oaklands called me into his room, and closing the door, said, "Well, Fairleigh, I have thought over all you said yesterday,—made up my mind—and acted upon it."—"Bravo!" replied I, "I am so glad, for, whenever you will but rouse yourself, you are sure to act more rightly and sensibly than anybody else; but what have you done now? Let me hear all about it." "Oh, nothing very wonderful," answered Oaklands; "when I came to look at my pocket-book, I found I had lost, from first to last, above 150*l*." "Good gracious!" cried I, aghast at the magnitude of the sum; "what will you do?" Oaklands smiled at my look of horror, and continued, "About 100*l* of this I still owe Cumberland, for, after my ready money was gone, I merely set down on paper all I won or lost, as he said I could pay him at any time, just as it suited me best; and I thought I would wait till I got my next quarter's allowance, pay him out of that, and

be very economical ever after.—Well, when I saw what the sums amounted to, I found this plan would never answer, and that I was getting into a mess; so I made up my mind to put an end to the thing at once,—and sat down and wrote to my father, telling him, that I had been playing billiards every day for some time past, with a friend, (of course I did not mention who,) and that without being at all aware of it, my losses had mounted up, till I owed him 100*l*. I mentioned at the same time that I had a pretty long bill at Smithson's, and then went on to say, that I saw the folly, if not worse than folly, of what I had been doing; and that I applied to him, as the best friend I had in the world, (and I am sure he is too, Frank,) to save me from the consequences of my own imprudence." "I am very glad you did that; it was much the best thing," interrupted I. "As soon as I had written my letter," continued Oaklands, "I went to Cumberland, and told him that I found I had been going on too fast,—that I owned he was too good a player for me,—and that I therefore did not mean to play any more—and would pay him as soon as I received my father's answer." "And what did he say to that?" inquired I. "Why, he seemed surprised and a little annoyed, I fancied. He denied being the best player, and begged I would not think of paying him yet, saying that I had been unlucky of late, but that, if I would go on boldly, luck was sure to change, and that I should most likely win it all back again." "And you?" "Oh! I told him that was the true spirit of gambling; that I did not choose to owe so much to any man, as I owed him, and that that pay him I would. Well then, he said, that if I did not like to trouble my father about such a trifle, and yet was determined to pay him, it could be very easily managed. I asked, how? He hummed and ha'd, and at last said, that Smithson would advance me the money in a minute—that I should only have to sign a receipt for it, and need not pay him for years—not till I was of age, and not then if I did not like—that no one would be any the wiser—and he was going on with more in the same style, when I stopped him, by answering very abruptly, that such an arrangement was not to my taste, and that I was not yet reduced to borrowing money of my tailor." "Quite right, I am so glad you told him that," interposed I; "what *did* he say then?" "Something about not meaning to offend me, and its being a thing done every day." "By him perhaps," said I, recollecting the scene I had witnessed soon after my arrival. "Why! what do you mean?" said Oaklands. "I'll tell you when you have done," replied I; "but I want to know how all this ended." "There was not much more. He tried to persuade me to go again to-day, and play another match. I told him I was engaged to ride with you. Then he looked as if he was going to be angry. I waited to see, and he wasn't, and so we parted. "And what think you of Cumberland now?" inquired I. "I can't say I altogether like the way in which he has behaved about this," replied Oaklands; "it certainly looks as if he would have had no objection to win as much as he could from me, for he must have known all along that he was the best player. It strikes me that I am well out of the mess, and I have to thank you for being so, too, old fellow." "Nay, you have to thank your own energy and decision; I did nothing towards helping you out of your difficulties." "Indeed! if a man is walking over a precipice with his eyes shut, is it nothing to cause him to open them, in order that he may see the dangers into which the path he is following will lead him?" "Ah! Harry, if you would but exert yourself, so as to keep your own eyes open"—"What a wide-awake fellow you would be," interposed Coleman, who, after having tapped twice, without succeeding in making himself heard, (so engrossed were we by the conversation in which we were engaged,) had in despair opened the door in time to overhear my last remark:—"I say, Gents, as Thomas calls us," continued he, "what have you been doing to Cumberland, to put him into such a charming temper?" "Is he out of humour then?" inquired Oak-

lands. "I should say, *rather*," replied Coleman, winking ironically; "he came into our room just now, looking as black as thunder, and, as I know he hates to be spoken to when he is in the sulks, I asked him if you were going to play billiards with him to-day." Harry and I exchanged glances, and Coleman continued: "He fixed his eyes upon me, and stared as if he would have been greatly relieved by cutting my throat, and at last growled out, 'No; that you were going to ride with Fairleigh;' to which I replied, 'that it was quite delightful to see what great friends you had become;' whereupon he ground his teeth with rage, and told me, 'to go to the Devil for a prating fool;' so I answered, that I was not in want of such an article just at present, and had not time to go so far to-day, and then I came here instead.—Oh, he's in no end of a rage, I know."—"And your remarks would not tend to soothe him much either," said I. "Oaklands has just been telling him, he does not mean to play billiards again." "Phew!" whistled Coleman, "that was a lucky shot of mine; I fancied it must have been something about Oaklands and billiards that had gone wrong, when I saw how savage it made him. I like to *rile* Cumberland sometimes, because he's always so soft and silky; he seems afraid of getting into a good honest rage, lest he should let out something he does not want one to know. I hate such extreme caution; it always makes me think there must be something very wrong to be concealed, when people are so mighty particular."—"You are not quite a fool after all, Freddy," said Oaklands, encouragingly. "Thank ye for nothing, Harry Longlegs," replied Coleman, skipping beyond the reach of Oaklands' arm.

A few mornings after this conversation took place. Oaklands, who was sitting in the recess of the window, (from which he had ejected Lawless on the memorable evening of his arrival,) called me to him, and asked in a low tone of voice, whether I should mind calling at the billiard-rooms when I went out, and paying a month's subscription which he owed there. He added, that he did not like going himself, for fear of meeting Cumberland or the Captain, as, if they pressed him to play, and he refused, (which he certainly should do,) something disagreeable might occur, which it was quite as well to avoid. In this I quite agreed, and willingly undertook the commission. While we were talking, Thomas came into the room with a couple of letters, one of which he gave to Oaklands, saying, it had just come by the post, while he handed the other to Cumberland, informing him that the gentleman who brought it was waiting for an answer. I fancied that Cumberland changed colour slightly, when his eye fell upon the writing. After rapidly perusing the note, he flung it into the fire, saying, "My compliments to the gentleman, and I'll be with him at the time he mentions."—"Well, this is kind of my father," exclaimed Oaklands, looking up with a face beaming with pleasure; "after writing me the warmest and most affectionate letter possible, he sends me a cheque for 300*l*. upon his banker, telling me always to apply to him when I want money, or get into difficulties of any kind; and that if I will promise him that this shall be the case, I need never be afraid of asking for too much, as he should be really annoyed were I to stint myself." "What a pattern for fathers!" exclaimed Coleman, rubbing his hands. "I only wish my old dad would test my obedience in that sort of way;—I'd take care I would not annoy him by asking for too little; he need not fret himself on that account. Ugh," continued he, with a look of intense disgust, "it's quite dreadful to think what perverted ideas he has on the subject; he actually fancies it his business to *spend* his money as well as to make it; and as for sons, the less they have the better, lest they should get into extravagant habits, forsooth! I declare it's quite aggravating to think of the difference between people: a cheque for 300*l*. from a father, who'll be annoyed if one does not always apply to him for money enough! Open the window there! I'm getting faint!"

"Don't you think there's a little difference between

sons as well as fathers, Master Fred, eh?" inquired Lawless. "I should say some sons might be safely trusted with 300*l.* cheques; while others are certain to waste two shillings, and misapply sixpence, out of every half-crown they may get hold of."—"Sir, I scorn your insinuations; sir, you're no gentleman," was the reply, which produced (as was probably intended,) an attack from Lawless, which Coleman avoided for some time, by dodging round chairs and under tables. After the chase had lasted for several minutes, Coleman, when on the point of being captured, contrived by a master stroke of policy, to substitute Mullins in his place, and the affair ended by that worthy being knocked down by Lawless, "for always choosing to interfere with everything," and being kicked up again by Coleman, "for having prevented him from properly vindicating his wounded honour."

"Who's going near the Post Office, and will put a letter in for me?" asked Oaklands. "I am," replied Cumberland; "I've got one of my own to put in also." "Don't forget it or lose it, for it's rather important," added Oaklands; "but I need not caution you, you are not one of the harebrained sort; if it had been my friend Freddy now"—"I'll tell you what it is, Mr. Oaklands," said Coleman, putting on an air of offended dignity, in which, though very much exaggerated, there was at the bottom the smallest possible spice of reality,—a thing, by the way, one may often observe in people who have a very strong appreciation of the ridiculous, and who, however fond they may be of doing absurd things for the sake of being laughed at, do not approve of their buffooneries being taken for granted.—"I'll tell you what it is, sir,—you have formed a most mistaken estimate of my character; I beg to say, that any affair I undertake is certain to be conducted in a very sedate and business-like manner. My prudence I consider unimpeachable; and as to steadiness, I flatter myself I go considerably ahead of the Archbishop of Canterbury in that article. If I hear you repeat such offensive remarks, I shall be under the painful necessity of elongating your already sufficiently prolonged proboscis." "Come and try," said Oaklands, folding his arms with an air of defiance. Coleman, reckoning on his dislike of exertion, and trusting to his own extreme quickness and activity to effect his escape scot-free, made a feint of turning away as if to avoid the contest, and then, with a sudden spring, leap'd upon Oaklands, and succeeded in just touching his nose. The latter was however upon his guard, and, while by seizing his outstretched arm with one hand, he prevented him from attaining his object, he caught him by the coat-collar with the other, and detained him prisoner. "I've got you this time, at all events, Master Freddy; now what shall I do with you, to pay you off for all your impertinence?" said Oaklands, looking round the room in search of something suitable to his purpose. "I have it," continued he, as his eyes encountered the bookcase, which was one of those large square-topped, old-fashioned affairs, standing about eight feet high, and the upper part forming a sort of glass-fronted closet, in which the books were arranged on shelves. "Great men like you, who go ahead of Archbishops and so on, should be seated in high places." So saying, he lifted Coleman in his arms, with as much ease as if he had been a kitten; and stepping up on a chair which stood near, seated him on the top of the bookcase, with his head touching the ceiling, and his feet dangling above six feet from the ground. "What a horrid shame," said Coleman; "come help me down again, Harry, there's a good fellow."—"I help you down!" rejoined Oaklands. "I've had trouble enough in putting you up I think; I'm a great deal too much tired to help you down again." "Well, if you won't, there's nobody else can," said Coleman, "unless they get a ladder or a fire-escape,—don't call me proud, gentlemen, if I look down upon you all, for I assure you, it's quite involuntary on my part." "A decided case of *top aloft*!" he looks quite the cherub, does he not?" said Lawless. "They are making game of you, Coleman," cried Mullins, grinning. "I hope not," was

the reply, "for in that case I should be much too *high* to be pleasant." "They ought to keep you there for an hour longer for that vile pun," said Cumberland. "Is your letter ready, Oaklands, for I must be going?"—"It is up stairs, I'll fetch it," replied Oaklands, leaving the room. "Well, as it seems I am here for life, I may as well make myself comfortable," said Coleman, and suiting the action to the word, he crossed his legs under him like a tailor, and folding his arms, he leaned his back against the wall, the picture of ease.

At this moment there was a gentle tap at the door; some one said, "Come in," and, without a word of preparation, Dr. Mildman entered the apartment. Our surprise and consternation at this apparition may easily be imagined. Cumberland and Lawless tried to carry it off by assuming an easy, unembarrassed air, as if nothing particular was going on. I felt strongly disposed to laugh; while Mullins looked much more inclined to cry; but the expression of Coleman's face, affording a regular series of "dissolving views," of varied emotions, was the "gem" of the whole affair. The unconscious cause of all this excitement, whose back was turned towards the bookcase, walked quietly up to his usual seat, saying as he did so, "Don't let me disturb you,—I only came to look for my eye-glass, which I think I must have dropped."—"I see it, sir," said I, springing forward, and picking it up; "how lucky none of us happened to tread on it and break it!"—"Thank you, Fairleigh, it is an old friend, and I should have been sorry to have any harm happen to it," replied he, as he turned to leave the room, without having once raised his eyes from the ground. Coleman, who up to this moment had considered a discovery inevitable, gave me a sign to open the door, and, believing the danger over, was proceeding to relieve his feelings by making a hideous face at his retiring tutor, when the bookcase, affected no doubt by the additional weight placed upon it, suddenly gave a loud crack. "Bless my heart," said Dr. Mildman, looking up in alarm, "what's that! (gracious me!)" continued he, starting back as his eyes encountered Coleman, "there's something alive up there! why it's—eh!" continued he, levelling his newly-restored eye-glass at the object of his alarm; "yes, it certainly *is* Coleman; pray, sir, is it usually your 'custom of an afternoon,' as Shakespeare has it, to sit perched up there cross-legged, like a Chinese mandarin: it's a very singular taste."—"Why, sir," replied Coleman, for once completely taken aback, "you see I didn't—that is, I wasn't—I mean, if I had—I shouldn't."—"Hum," resumed Dr. Mildman, with whom he was rather a favourite, and who, now that he had satisfied himself it was not some wild animal he had to deal with, was evidently amused by Coleman's embarrassment, "that sentence of yours is not particularly clear or explanatory; but," continued he, as a new idea occurred to him, "how in the world did you get up there? you must have flown." "I didn't get up, I was—that is he—" stammered Coleman, remembering just in time that he could not explain without involving Oaklands. "And how are you ever to get down again?" said Dr. Mildman.

"Has the pretty bird flown yet?" cried Oaklands, hastily entering the room; when, observing the addition the party had received during his absence, he started back, murmuring in an under tone "the old gentleman, by Jove!" Quickly recovering himself, however, he sprang upon a chair, and seizing Coleman in his arms, whisked him down with more haste than ceremony; and going up to Dr. Mildman, said respectfully, "that was a bit of folly of mine, sir; I put him up there; I merely did it for a joke, and I hadn't an idea you would come in and find him."

"Never mind," replied Dr. Mildman, good-naturedly, "as you have contrived to get him down again safely, there is no harm done." Adding as he left the room, "that young man is as strong as Hercules. I hope he'll never take it into his head to pop me up any where, for I am sure he could do it if he chose."

In the course of my walk that afternoon, I called at the billiard rooms in F— Street, in order to pay Oaklands' subscription. On inquiring for Mr. Johnson, the proprietor, I was told that he was engaged at present, but that if I did not mind waiting for a few minutes, he would be able to attend to me. To this I agreed, and was shown into a small room down stairs, which, from its sanded floor, and a strong odour of stale tobacco which pervaded it, was apparently used as a smoking-room. It opened into what seemed to be a rather spacious apartment, from which it was divided by a glass half-door, across the lower panes of which hung a green blind: this door, on my entrance, was standing slightly ajar. The day being cold, there was a bright fire burning on the hearth; near this I seated myself, and, seduced by its drowsy influence, fell into a kind of trance, in which, between sleeping and waking, my mind wandered away to a far different scene, among well-known forms and familiar faces, that had been strangers to me now for many a long day. From this day-dream I was aroused by sounds proceeding from the adjoining apartment; which, as I became more thoroughly awake, resolved themselves into the voices of two persons apparently engaged in angry colloquy. "I tell you," said a gruff voice, which somehow seemed familiar to me, "I tell you it is the only chance for you; you must contrive to bring him here again, and that without loss of time." "Must I again repeat that the thing is impossible?" was the reply, in tones I knew but too well; "utterly impossible; when once his mind is made up, and he takes the trouble to exert himself, he is immovable; nothing can shake his determination." "And is this your boasted skill and management?" rejoined the first speaker; "how comes it, pray, that this over-grown child, who seemed the other day to be held as nicely in leading-strings as need be,—this raw boy, whose hot-headedness, simplicity, and indolence rendered him as easy a pigeon to pluck as one could desire;—how comes it, I say, that he has taken alarm in this sudden manner, so as to refuse to come here any more? you've bungled this most shamefully, sir, and must take the consequences." "That's just the point I cannot make out," replied the second speaker, who, as the reader has probably discovered, was no other than Cumberland; "it's easy enough for you to lay it all to my mismanagement, Captain Spicer, but I tell you it is no such thing; did not I accommodate my play to his, always appearing to win by some accident, so that the fool actually believed he was the best player, while he was losing from 20*l.* to 30*l.* a day? Didn't I excite him, and lead him on by a mixture of flattery and defiance, so that he often fancied he was persuading me to play against my will, and was so ready to bet that I might have won three times what I have of him, if you had not advised me to go on quietly, and by degrees? Did not you refuse when I wished you to take him in hand yourself, because you said I understood him best, and managed him admirably? No, I believe that detestable young Fairleigh is at the bottom of it: I observed him watching me with that calm, steadfast glance of his, that I hated him from the first moment I saw him, and I felt certain some mischief would arise from it." "Yes!" replied Spicer, "that was your fault too, why did you let the other bring him? every fool knows that lookers-on see most of the game." "I was afraid to say much against it, lest Oaklands should suspect anything," rejoined Cumberland, "but I wish to Heaven I had now; I might have been sure no good would come of it—that boy is my evil genius." "I have no time for talking about geniuses, and such confounded stuff," observed Spicer, angrily, "so now to business, Mr. Cumberland: you are aware you owe me 200*l.* I presume?" Cumberland grumbled out an unwilling assent, to which he appended a muttered remark not exactly calculated to enhance the Captain's future comfort. "Like a good-natured fool," continued Spicer, "I agreed to wait for my money till you had done what you could with this Mr. Oaklands." "For which for-

bearance you were to receive 50*l.* extra, besides anything you could make out of him by private bets," put in Cumberland. "Of course I was not going to wait all that time for my money for nothing," was the reply; "you have only as yet paid me 50*l.* You tell me you can't persuade Oaklands to play again, so there's nothing more to be got from that quarter, consequently nothing more to wait for; I must trouble you, therefore, to pay me the 200*l.* at once—for, to be plain with you, it won't do for me to remain here any longer,—the air does not agree with me." "And where on earth am I to get 200*l.* at a minute's notice?" said Cumberland: "you are as well aware the thing is impossible as I am." "I am aware of this, sir," replied the Captain, with an oath, "that I'll have my money; aye, and this very day too, or I'll expose you,—curse me if I don't. I know your uncle's address: yes! you may well turn pale, and gnaw your lip—other people can plot and scheme as well as yourself: if I'm not paid before I leave this place, and that will be by to-night's mail, your uncle shall be told that his nephew is an insolvent gambler; and the old tutor, the Rev. Dr. Mildman, shall have a hint that his head pupil is little better than a blackleg." "Now listen to me, Spicer," said Cumberland quietly, "I know you might do what you have threatened, and that to me it would be neither more nor less than ruin, but—and this is the real question, pray what possible advantage (save calling people's attention to the share, a pretty large one, you have had in making me what I am) would it be to you?" "To me, sir! Eh! why, what do you mean, sir? your uncle is a man of honour, and of course as such would pay his nephew's debts for him,—more particularly when he knows that if he refuses to do so, that nephew will be sent to jail; yes, to jail, sir." "There; blustering is of no use with me, so you may save yourself that trouble, Captain," replied Cumberland; "as to sending me to jail, that is absurd; you can't arrest a minor for debt, and I shall not be of age these two years. My uncle is, as you say, what is called a man of honour, but he is not one of those over-scrupulous fools who will pay any demand, however dishonest and unreasonable, rather than tarnish the family honour, forsooth! No! he will pay what the law compels him, and not a farthing more. I leave you to decide whether the law is likely to be of much use to you in the present case. Now listen to me; though you cannot obtain the money by the means you proposed, you can, as I said before, do me serious injury; therefore, if for no other reason but to stop your mouth, I would pay you the whole if I could, but I have not the power of doing so at present. What I propose then, is this—Oaklands will pay me in a day or two 100*l.*; this I will hand over to you at once, and will give you a written promise to pay you the rest in the course of the next six months; for, before that time I must raise money somehow, even if I have to sell every farthing I expect to come into, to the Jews, in order to do it." "Won't do," was the reply; "the ready isn't enough; I must leave this country in a day or two, and I must have money to take with me; come, 150*l.* down, and I'll let you off the other 50*l.*" "It's impossible, I can get no other money yet, excepting the sum Oaklands is to pay me." "Yes! and how the Devil am I to be sure he will pay you directly; I'm pretty certain the fool's hard up himself; he hasn't paid cash for a month past." "If that's all you are afraid of, I can soon convince you to the contrary; here's a letter to his father's banker, which I am going to put into the post directly, with a cheque for 300*l.* in it; there, hold it up to the light, and you will see the figures yourself." "By Jove! so it is," exclaimed Spicer. "I say, Cumberland," he continued, and then the voices sunk almost into a whisper, so that I could not catch more than a word here and there, but by the tone I judged that the Captain was making some proposition, which Cumberland refused to agree to. At length I heard the former say "50*l.* down, and a receipt in full"—Cumberland's reply was inaudible, but when the Captain spoke again, I

caught the following words—"not the slightest risk, only you do as I say, and"—At this moment the outer door of the room in which I was sitting opened, while the one communicating with the other apartment was violently slammed to, from the farther side, and I heard no more.

The new comer was a little slipshod girl in dirty curl-papers, who informed me that her master was sorry he could not see me that day as he was particularly engaged, but if I would do him the favour of calling to-morrow, at the same hour, he should be at leisure, &c.—To this I answered something, I scarcely knew what, and seizing my hat, rushed out at the front-door, to the great astonishment of the curl-papered damsel, who cast an anxious glance at the pegs in the hall, ere she could convince herself that I had not departed with more hats and coats than legitimately belonged to me.

DANGERS OF THE POLAR SEAS.

ON a dark stormy night in the month of August, 1837, a ship was sailing heavily through the troubled waters of the Atlantic. The clanging of the pumps was heard on board, and both men and officers seemed exhausted with fatigue. They were, indeed, pumping for their lives, and with all their exertions it seemed impossible to keep the ship afloat: the water was pouring in in cascades; the gale was gradually increasing in fury, strengthened by squalls, which raised a long breaking sea, in which the ship plunged heavily. She was hourly getting more water-logged; the straining and creaking of her whole frame—her prolonged dull roll to windward—everything seemed to show that the ship must be lost. Shortly after midnight, the first lieutenant entered the captain's cabin with the fearful intelligence that the ship was sinking, the crew being no longer able to keep under the leaks. The boats were ordered out, but the men resolved to make another trial, and, exhausted as they were, the pumps were worked with fresh vigour. The ship still struggled on, crazy and water-logged, but the gale abated, and the wind was favourable. Crowding every stitch of canvass, the joyful cry of "Land" was, at length, heard from the mast-head. It was late at night before they reached it; rockets and guns were fired for the purpose of obtaining a pilot, but no one came; therefore, trusting to the soundings, they glided silently on, and at midnight anchored safely in Lough Swilly.

Fifteen long months had elapsed since the pleasing sound of a falling anchor had greeted the ears of that crew, and, in reflecting on all that had passed in the interval, they could not but feel devoutly grateful for the mercy which had been vouchsafed them; and how much was that feeling increased when the wind suddenly changed, and blew a gale off shore, which, but a few hours earlier, must have driven them back to sea, and terminated their labours in a watery grave.

As the ship was gradually sinking, it was run ashore on a small sandy beach. It was found, at low water, that upwards of twenty feet of the keel, together with ten feet of the stern-post, were driven over more than three and a half feet on one side, leaving a frightful opening astern for the free ingress of the water. When the generally shattered state of the ship was seen, every one on board expressed astonishment that she had ever floated across the Atlantic.

The numerous and extensive injuries which this ship had received were not from the shot of an enemy, for she was engaged on one of those services which are far more honourable, glorious, and beneficial to man than war: she had been sent to explore the shores of the Arctic sea, and to connect the discoveries of those distinguished arctic explorers, Parry, Franklin, Back, and others; but while yet out in the open sea, she was arrested in her course by a premature winter, wedged up by massive ice for nine whole months, subjected to the repeated battering assaults of solid waves of ice; and when, at length, her icy chains dissolved, she was found to be in the battered condition already described, and forced to return without having accomplished the objects of her expedition. And yet the captain and his brave associates achieved what none perhaps but British seamen could have done: they succeeded, under the Divine protection and blessing, in saving the ship and their own lives, which, with less faith, less courage and determined resolution, could never have been done.

In the year 1836, the Royal Geographical Society recommended this voyage of discovery to the Colonial Secretary, and the Admiralty supplied a ship, the *Terror*, under the command of CAPTAIN BACK, with instructions to proceed to Wager River or Repulse Bay, where, leaving the ship under the care of an officer, he was to proceed with a large party across the intervening land to the eastern shore of Prince Regent's Inlet, sending one party to the north as far as the Fury and Hecla strait, and the other to pursue the continental coast line to the mouth or estuary of Back's River, and its continuation as far as the point Turnagain of Franklin. In the instructions it was stated to be their Lordships' full belief that all the service detailed might be fully and faithfully performed in the course of one season, and "that this Arctic expedition may be distinguished from all others by the promptitude of its execution, and by escaping from the gloomy and unprofitable waste of eight months' detention: it is therefore our distinct orders that every effort shall be made to return to England in the fall of this year." It will be seen in the course of the following details how true is the old proverb—"Man proposes, God disposes."

On the 14th June, 1836, the *Terror* left Chatham, and on the 28th July crossed Davies' Strait. Having passed Resolution Island, with its dense fogs and its whirlpools, tossing about masses of ice, sweeping the ship among them, and rendering her unmanageable, they came to the Savage Islands, and here their difficulties may be said fairly to have commenced. The navigation of Hudson's Strait was difficult on account of contrary winds and ice: the drift ice was very heavy, and difficult to steer clear of; and often, in spite of all their care, the ship would drive on the immense masses with a concussion that made all the bells ring, and almost threw those below from their chairs.

On the 14th August they arrived close upon Salisbury Island, the place where Back's instructions pointed out the two routes for his choice; and he decided upon that which led in a north-west direction through the Frozen Strait. On the 18th the ice became so close that there was no room to work the ship. Some experienced seamen, who had been in the Greenland trade, declared they had never beheld such heavy ice. It seemed to consist of numerous floes wedged together, the whole surface

so ragged and piled up, that the height of the ridges frequently exceeded fifteen feet; and no human being could have travelled far over it. To those unaccustomed to polar navigation, the prospect was most discouraging, all progress in this direction being apparently stopped; but the more experienced looked forward to a change of wind, tide, or current, or some of those unaccountable circumstances which in a few hours, even of entire calm, create so sudden and marvellous a change in an icy sea. Accordingly, about midnight, some large pieces of ice were observed to be drifting away, and in the course of a few hours a path was opened through what seemed to be an impenetrable barrier. They made, however, but slow progress, constantly struggling with the ice, tacking continually to weather, or to avoid, the floes, and longing for a favourable breeze. The land shone blue from the distance, and beautifully soft, as contrasted with the white cold glare of the intermediate ice around, reflecting, by the setting sun, the tints of the intervening masses thrown into the most picturesque groups and forms; spires, turrets, and pyramids, many in deep shape, presented, altogether, a scene sufficient for a time to cheat the imagination, and withdraw the mind from the cheerless reality of the actual situation.

The ship lay becalmed during several days, but, at length, a wind arose which broke up the cemented masses of ice, and disentangled the ship. It now became evident that the great body of ice of the previous winter had not been broken up, and that season with the accumulations of the following having been detached from its bonds by the storms of spring, it had been driven, probably, by the combined action of wind and current, from the bays and harbours of the north, to the place where the ship was so impeded by it. On the evening of the 13th September the Cape Comfort of Baffin was seen. The next day the wind came, but it was from the adverse quarter, and had a direful effect on the shore ice, in which the ship was imbedded, the force being so great that what was not crushed was raised up to various heights; one ponderous mass, with several peaks, being lifted upwards of twenty feet. The ship, severely nipped, went on drifting with the ice to the shore, the soft blue tint of which had now exchanged, on a near approach, to black frowning masses of inaccessible rock. "At this time," says Captain Back, "we appeared to be not more than four miles from the land, which was broken into exposed bays, utterly without shelter from the north, and blocked up with close packed ice. Not a pool of water was visible in any direction: to the mercy of Providence alone could we look for rescue from our perilous situation. None but those who have experienced it can judge of the weariness of heart, the blank of feeling, the feverish sickliness of taste, which gets the better of the whole man under circumstances such as these. Not an incident occurred to relieve, for a moment, the dull monotony of our unprofitable detention."

Thus delayed almost within sight of port, the season for active operations slipping away, the ship was held still within sight of the same land, "as if it were in the grasp of a giant;" and thus it was destined to be held from this time for eight or ten months to come. Well might Back speak of the name of this Cape as being "most inappropriate;" for, instead of "Comfort," it inspired daily, nay hourly, dread that the ship would be forced ashore.

During the whole of September the ship was whirled about, backwards and forwards, as the wind, or the current, or the tide directed, all command over her being lost. Under these circumstances, it was the opinion of all the officers that any attempt to reach Repulse Bay would be hopeless, and they suggested certain precautions, in the event of the ship breaking up under the enormous pressure to which she was subjected. Some idea of this pressure may be formed from the fact, that in the walls of ice on either side of her, her mould was stamped as perfectly as in a die.

As there was now no chance of escape for eight or nine months to come, it was determined to cut a dock in a large floe of ice, so that the ship might be protected by it, as long as the floe held together. Just as this plan was about to be carried into execution, a commotion took place which separated the whole body of ice into single masses, tossed into heaps, or ground to powder, whatever interrupted its course, and finally drove the whole up the Frozen Strait. Other masses, however, succeeded, which hemmed the ship in, and thus both she and they drifted about, often with secure bays and harbours apparently within reach, and still obliged to be prepared for being wrecked. Of course, every attempt to cut a channel through the ice into some bay or harbour would have been vain, on account of the ice not presenting a flat surface, but heaped masses, which filled up every opening as fast as it was made. To add to the discomfort of their situation, the warming apparatus, which ought to have raised the interior of the ship to a comfortable temperature, miserably failed, so that they were reduced to two or three common fires.

The ice continued to be in motion up to the 20th November, but the floe, into which the ship was frozen, remained tolerably secure. Snow walls and galleries were built in different directions from the ship, which, being destined for the comfort of all, were cheerfully undertaken.

On the 22d December a furious storm arose, such that no man could face it. Several, who endeavoured to perform some duty outside the ship, were instantly frost bitten and obliged to return. The officer of the watch in merely going from the housing to the taffrail to register the thermometers, had the whole of his face frozen. Not that the temperature was so low as it had been a few days before, for it was then 53° below zero, and on this occasion only 30° below zero, but the wind extracted the heat with a rapidity beyond endurance, so that a short exposure to it would have been fatal to the hardiest. The storm raged like a hurricane, and covered the ship with snow-drift. The topmasts shook like wands, and the lee rigging was forced out like a bow. As the wind blew directly off shore there was great cause for apprehension as to the holding together of the floe. On the 24th the storm abated, and they then discovered that they had actually been driven out towards Frozen Strait, twelve or fourteen miles to the east of Cape Comfort.

As the sailors had abundance of spare time on their hands, an evening school was instituted under the superintendence of Lieut. Smyth, and occasionally visited by Capt. Back. The example of Parry was also not forgotten in contriving amusements for the men; plays were occasionally acted by the officers; foot-ball was played upon the level surface of the floe when the weather permitted; and a swing was hung from the bowsprit. The festivities

of Christmas-day were not forgotten; and New-year's-day was duly ushered in by sound of bell. Still, however, the situation of the ship caused much anxiety, and anxiety fosters disease. The scurvy made its appearance, and this was thought to be aggravated by the fetid and impure atmosphere that lurked in the lower parts of the deck; and the difference of temperature, which frequently amounted to 110°, between the outside and the inside of the ship.

The floe, which had hitherto served to give some security to the ship, as well as a place of exercise for the men, at length began to crack and to open rents, thereby giving freedom to large masses of ice, yellow and brown with age, which darted to the surface, looking like unsightly blotches on the pale features of the general scene. On the 17th February, an alarm was given that the floe was breaking up alongside, and, in fact, a rent opened from the stern of the ship to the edge of the floe, and another from the bow to the east brink. Gaping rents were made in the snow walls about the ship; a crashing, grinding, and rushing noise was heard beneath, as well as at the borders of the floe, and fresh cracks opened in it. The ship creaked in her beams and timbers, and at day-light, to the dismay of all, an advancing rampart of ice, about thirty feet in height, of a semicircular form, was seen rolling to seaward, in one vast body. All around, enormous calves of ice escaped from confinement, and, being tossed up in irregular positions, looked like so many engines of destruction. But, just when the danger seemed greatest, the tumult suddenly ceased; and it was fortunate that it did so, for the ice was so splintered and jagged, that to put a boat upon it was out of the question; nor could it be made, even for an hour, a depository of provisions, full as it was of cracks and small holes opening every instant: nothing could have been conveyed to land, now about seven miles distant, and no one, probably, could have reached it, even without incumbrance.

The broken arches of the snow galleries, the shattered snow walls, the cracks in the floe, and the vast mounds of ice and snow, called to mind the scene which must follow upon an earthquake; and when the ice actually separated, some of the galleries floating in the water looked like tunnels. To be at freedom to move would, two months later, have been the summit of their wishes, but it now only mocked them with hopes that could not be realized, while it involved immediate peril. The ice returned with accumulated force, making the ship crack fore and aft, with a hideous noise. Capt. Back says that his cabin-door could not be forced open without difficulty, and was split in the pressure. The people, in alarm, crowded upon deck, and even the poor sick came tottering aft, in an agony of terror. Providentially the ship, instead of yielding to the pressure and cracking like a walnut, was forced up, so that the opposing ice either passed under her, or was wedged against the large masses at either extremity. Capt. Back remarks that, though he had seen vast bodies of ice from Spitzbergen, to 150° W. lon., under various aspects, some beautiful, and all more or less awe-imposing, he had never witnessed, nor even imagined, anything so fearfully magnificent as the moving towers and ramparts that now frowned on every side. The innermost fragments of the floe, every now and then, closed upon the defenceless vessel with a force that made every

plank complain. The night was fine, but the vapour which arose from the numerous cracks, quickly became converted into small spiculæ of snow, rendering the cold intolerably keen to those who had to face the wind.

Under these trying circumstances, the crew were exhorted to implicit obedience to orders, as well as kind and compassionate help to the sick. Fresh articles of warm clothing were distributed, and, as the moment of the destruction of the ship was uncertain, the bags in which those articles were contained were placed on deck with the provisions, to be ready on the instant. Bales of blankets, bearskins, and pyroligenous ether for fuel, were got out, together with whatever might be necessary if the ship should suddenly break up.

The ship thus continued to be assailed by ponderous waves of ice, and the intervals of repose were but short. At ten o'clock P.M. on the 1st March, several sudden jerks were heard, and an hour after a general rumbling, after which all became still. The conflict was apparently ended, when, suddenly, the vast bodies in contact with, and immediately surrounding, the ship, became fearfully agitated, rising up in grinding conflict, piece thrown over piece, until the ponderous walls tumbled over with a hideous compound of such sounds as are expressed by the words screeching, howling, and whining. Such was the violence of the pressure that the ship was lifted up abaft, and both hull and rigging trembled violently. Another pause ensued; the mist cleared away and revealed the magnificence of a polar sky; a faint gleam of aurora was playing near the zenith, and so beautiful and hushed was everything, that nature seemed, as it were, in a trance. But scarcely had the idea flitted across the mind when the war burst out again with redoubled fury, and huge fragments and masses seemed to be rolling down upon the ship with an impetuosity that threatened immediate destruction. Repose was impossible; many started from their beds, preferring to see, as well as hear, the danger. The current rushed irresistibly to the stern, and, taking the hull fore and aft, forced a complete stream of ice under the bottom, lifting the after part still higher up than before. At length, the ship became so completely hampered by ice underneath, that the remainder of the floe, on either side, moved about eight or ten feet a-head, leaving the ship fixed in the midst, and wedged up in every direction. As day-light broke, the havoc was more clearly perceived, and a wild scene of confusion it was. The men were employed in making small sledges, and arrangements were made for whatever might happen.

These attacks were now continued almost every night. On the 7th of March there commenced a series of strange and unaccountable convulsions, which must have proved fatal to any less strongly fortified ship. The northerly breezes which had brought the ice down for more than 360 miles, had fallen calm: a light westerly wind now prevailed, but some ominous rushing sounds were heard which gradually drew nearer as the flood made its way, either under the compact bodies that withstood the shock, or along the cracks and openings, where it gained a furious velocity, to which every thing seemed to yield. It happened that there were several of these around the ship, and, when they opened on it like so many conduits pouring their contents to a common centre, the concussion was absolutely appalling, rending the lining and bulk-heads in every

part, loosening some wooden props so that the slightest effort would have thrown them down, and compressing others with such force as to make the turpentine ooze out of them. At the same time the pressure was going on from the larboard side, where the three heaviest parts of the ruin of the floe remained, and after much splitting and cracking, accompanied by sounds like the explosion of cannon, the ship rose fore and aft, and heeled over about 10° to starboard, partly drawing the ship's bolts, and loosening the trenails.

So repeated were these assaults, that on examining the ship, considerable doubt existed whether she would be sea-worthy when the ice should slacken off to let her down to her bearings. The carpenter did what he could in stopping leaks, and otherwise repairing and strengthening the ship; and the officers agreed that, in the event of a wreck, a light boat with provisions should be landed to serve as a last resource, to communicate with the Hudson's Bay Company.

The advancing season, however, was beginning to work a favourable change; many of the huge hummocks which had kept company with the ship during the whole of the winter, and had weathered out every gale, had floated away, taking with them large portions of the surrounding ice. Birds began to be seen about the ship, and, on the 1st of April, it was gratifying to observe such decided symptoms of returning warmth as were afforded by water dripping and running along the decks.

Still, however, the ship was subject to the heavy and repeated assaults of the ice, one of the most fearful of which occurred on the 10th of April. At seven o'clock P.M. a noise was heard along the ice, about a mile to the west of the ship, and soon the breeze brought down the whole western body with irresistible force, suddenly assailing the floe pieces, grinding and ploughing up the edges. There were frequent pauses, not unlike the silence which succeeds a heavy crash of thunder; but, suddenly, on it came again, with a deafening roar, destroying every thing in its furious course.

"Wherever our eyes were turned, they were met by rising waves of ice rolling their burdens towards the ship. One in particular not more than thirty paces away had reared itself at least thirty feet on our inner floe-piece, which, strong as it was, gave way under the accumulated weight, and a mass of several tons being thus upturned, and added to the original bulk, the whole bore down slowly upon our quarter. The ship herself was high out of the water on the ice, but this overtopped her like a tower." The ship, unable to right herself, began to complain, and the scene became every moment more dark and threatening. Again preparations were made for a wreck, but circumstances were now even more discouraging than on former occasions. The large pieces of ice around, any one of which would have held the boats, provisions, &c., now no longer remained; the ship was surrounded by crushed and broken ice, presenting a multitude of angular and irregular surfaces, but none fit to trust a boat on, still less a human being: at the same time, every piece being in motion, it would have been impossible to have reached the land. "Knowing this, and feeling acutely for the many beings entrusted to my charge, it may be conceived with what intense anxiety I listened to the crashing and grinding around. The strength of the ship, tried and shaken as it had already been, could hardly be

expected to withstand the overwhelming power opposed to it, and what the result of that night might have been it is impossible to say, and painful to contemplate, had not an overruling Providence mercifully averted the crisis, by suddenly, and at the moment of greatest peril, arresting the tumult. In less time than it could be spoken, there was the stillness of death, and we were saved. The watch was called, the crew dismissed; and I trust that none that night laid his head on his pillow without offering up a devout thanksgiving for the mercy which had been vouchsafed him."

This was, happily, the last attack of this kind: the months of May and June rolled away with tedious uniformity, and still the ship was unable to move. Ice-saws had hitherto been useless on account of the thickness of the masses they had to contend with, varying often from thirty to fifty feet: but in July an attempt was made to cut away the remaining portion of the floe by joining two ice-saws so as to make one of the length of thirty feet. The work was continued with vigour during several days, when, on the 11th, a loud rumbling sound announced that the ship had broken her icy bonds, and was sliding gently down into her own element. "I ran instantly on deck, and joined in the cheers of the officers and men, who dispersed on different pieces of ice took this significant mode of expressing their feelings. It was a sight not to be forgotten. Standing on the taffrail, I saw the dark bubbling water below, and enormous masses of ice gently vibrating, and springing to the surface; the first lieutenant was just climbing over the stern, while other groups were standing apart, separated by this new gulf, and the spars, together with the working implements, were resting half in the water, half in the ice, whilst the saw, the instrument whereby this sudden effect had been produced, was bent double, and in that position forcibly detained by the body it had severed."

But the poor *Terror* was not yet free: her keel and the lower parts of the hull were still firmly imbedded in solid ice on both sides, though chiefly on the starboard, where a heavy fragment of the old floe still adhered. By means of ice anchors and the capstan the mass was splintered and separated into three pieces, two of which fell away, when, to the astonishment of all, the ship turned over on her side: "Then it was we beheld the strange and appalling spectacle of what may be fitly termed a submerged berg fixed low down, with one end to the ship's side, while the other, with the purchase of a long lever advantageously placed at a right angle with the keel, was slowly rising towards the surface. Meanwhile, those who happened to be below, finding everything falling, rushed or clambered on deck, where they saw the ship on her beam ends, with the lee boats touching the water, and felt that a few moments only trembled between them and eternity." Yet, in that awful crisis, there was no confusion, "the sails were clewed up and lowered; fresh men from former crews were stationed in the boats which again were rather unhooked than lowered; and with a promptitude and presence of mind which I shall ever remember with admiration, the whole were provisioned and filled with arms, ammunition, and clothing, and veered astern clear of all danger. The pumps were never quit, and though expecting that the ship might capsize, yet the question of, 'Does the leak gain on us?' was asked, and when answered in the nega-

tive, there was still a manifestation of hope. Our fate, however, yet hung in suspense, for not in the smallest degree did the ship right; happily for us there was a dead calm, which permitted us to examine the berg." This proved to be four fathoms thick in the part where it could be got at, and along this it was determined to cut, if, providentially, time should be spared for the operation. The men, assisted by the officers, worked night and day, with such success, that at length the ponderous mass broke off, and the good ship was once more in her own element, and subject to the will of man.

"Having unloaded and hoisted up the boats, the termination, as we hoped, of our weary anxieties was celebrated by the distribution of a little grog to the crew, who, after three cheers, which they requested permission to give to myself and the officers, the fine fellows were sent to their hammocks."

Captain Back still hoped to be able to attain the objects of the expedition, but the enfeebled health of the crew, and the crazy, broken, and leaky condition of the ship, left him no choice; therefore, after consulting the officers, he assembled the crew on the quarter deck, and told them they were about to proceed home. "It may well be pardoned, then, that their countenances brightened at the intelligence, and their feelings were manifested by three hearty cheers."

The ship continued to sail slowly among loose masses of ice, and did not escape them till the beginning of August. The change was marked by a peculiar gloom of a leaden grey tinge, the effect of a dark sky on open water, which seemed unusually dull and heavy to eyes inured to a twelve months' glare of Polar ice. "But it had not power to damp the joy that beamed on every countenance at the long wished for liberation that now quickly broke upon us. Our invalids became animated; and even the few who were seriously affected, and had long worn the sallow livery of disease, raised their feeble frames from their beds, and, with a smile, once more thought of home."

All honour to Captain Back and his brave associates! Their conduct was worthy of British seamen: they saved their ship, and earned the admiration and gratitude of their country. Captain Back received the honour of knighthood, and several of his officers were promoted.

The good ship *Terror* has also survived all her troubles. She has made a three or four years' acquaintance with the ice of the Antarctic ocean, and is now with Sir John Franklin once more in the Polar Seas.

POPULAR YEAR BOOK.

June 7.—Trinity Sunday. (1846.)

This festival is observed by the Anglican and Roman churches, on the Sunday next following Pentecost, or Whitsuntide. It was not established at Rome nor in France till the fourteenth or fifteenth century.

OLD CUSTOM.

In a letter to Mr. Aubrey, dated Ascension Day, 1682, and published in *Curl's Miscellanies*, 1714, is an account of the following ceremonies performed at Newton, North Wiltshire, to perpetuate the memory of the donation of a common to that place, by King Athelstan, and of a house for the hayward, i. e. the person who looked after the beasts that fed upon this common. Upon every Trinity Sunday, the parishioners being

come to the door of the hayward's house, the door was struck thrice, in honour of the Holy Trinity. They then entered, and the bell was rung, after which, silence being ordered, certain prayers were offered. Then was a garland of flowers "made upon an hoop," brought forth by a maiden of the town upon her neck, and a young man, a bachelor, of another parish, saluted her thrice, "in honour of the Trinity, in respect of God the Father." Then she placed the garland upon his neck, and kissed him three times "in honour of the Trinity, particularly God the Son." He next replaced the garland on her neck, and repeated the triple salutation, "in respect of the Holy Trinity, and particularly the Holy Ghost." Then he took the garland from her neck, and gave her a penny at least. "The method of giving the garland was from house to house annually, till it came round; in the evening every commoner sent his supper to this house, which is called the Bale-house and having before laid in there equally a stock of malt, they supped together, and what was left was given to the poor."

June 8.—We learn from Blount's "Jocular Tenures," that it is customary at Kidlington, Oxfordshire, on Monday after Whitsun week, (which in the current year falls on the above day of June,) to provide a fat live lamb, "and the maids of the town, having their thumbs tied behind them, run after it, and she that with her mouth takes and holds the lamb is declared *Lady of the lamb*, which being dressed, with the skin hanging on, is carried on a long pole before the lady and her companions to the green, attended with music and a moresco dance of men, and another of women, where the rest of the day is spent in dancing, mirth and merry glee. The next day the lamb is part baked, boiled, or roast, for the lady's feast, where she sits majestically at the upper end of the table, and her companions with her, with music and other attendants, which ends the solemnity."

June 14.—Corpus Christi Day. (1846.)

The institution of the Holy Eucharist was formerly celebrated with solemn thanksgiving to the Divine goodness on Maunday Thursday, in Holy Week; but that season being mostly occupied in commemorating the sufferings of Christ, a proper festival was appointed in honour of this great mystery. Pope Urban IV., in 1264, fixed it on the Thursday after the octave of Whit-Sunday, commanding it to be observed over the whole Church with a solemnity equal to the four great festivals of the year. In Roman Catholic countries the Host is on this day carried on under a splendid canopy in grand procession. The streets of populous cities are made fragrant with odoriferous shrubs, while the eye is refreshed with leaves and garlands, and mingled rain of herbs and flowers; and every domestic heir-loom of rare and costly device is brought forth to hall the passage of the blessed Sacrament.

The author of the "Popish Kingdom" gives the following account of the ceremonies of this day, in England, prior to the Reformation.

"Then doth ensue the solemn feast of Corpus Christi Day, Who, then, can shew their wicked use, and fond and foolish play? The hallowed bread, with worship great, in silver pix they bear About the church, or in the city passing here and there; His arms that bears the same two of the wealthiest men do hold, And over him a canopy of silk or cloth of gold Four others used to bear aloft, lest that some filthly thing Should fall from high, or some mad bird her dung thereon should fling.

CHRIST's Passion here derided is with sumptuous masks and plays, Fair Ursley, with her maidens all, doth pass amid the ways; And valiant George, with spear thou killest the dreadful dragon here; The devil's house is drawn about, wherein there doth appear A wondrous sort of damned sprites, with foul and fearful look; Great Christopher doth wade and pass with CHRIST amid the brook:

Sebastian, full of feathered shafts, the dint of dart doth feel,
There walketh Kathren, with her sword in hand and cruel wheel;
The chalice and the singing cake with Barbara is led,
And sundry other pageants played in worship of this Bread,
That please the foolish people well: what should I stand upon
Their banners, crosses, candlesticks, and relics many, on
Their cups and carved images, that priests with count'nance high,
Or rude or common people, bear about full solemnly?
Saint John before the Bread doth go, and pointing towards him,
Doth show the Lamb to be the same that takes away our sin:
On whom two clad in angels' shape do sundry flowers fling;
A number great with sacring bells with pleasant sound do ring;
The common ways with boughs are strewn, and every street
beside,
And to the walls and windows all are boughs and branches tied.

In villages the husbandmen about their corn do ride,
With many crosses, banners, and Sir John, their priest, beside;
Who in a bag about his neck doth bear the blessed Bread,
And oftentimes he down alights, and Gospel loud doth read."

The religious plays alluded to in the foregoing lines have been already referred to. Corpus CHRISTI Day is still celebrated in London, by the Worshipful Company of Skinners, who (attended by a number of boys, which they have in CHRIST'S Hospital School, and girls strewing herbs before them) walk in procession on the morning of this festival from their hall on Dowgate-hill, to the Church of St. Antholin's, in Watling-street, to hear service. This custom has been observed time out of mind.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

LINES ON A RUINED CHURCH.

W. T. V.

WHAT though no voice disturbs this roofless aisle,
Nor human footsteps mark the mouldering pile,
Its wasted shafts and columns worn and rent
Shall of oblivion be a fading monument.
Creeps now grey moss where gilded cornice shone;
And where the hymn, with circling incense, rose,
Croaks the dull raven to the winds' low moan,
Through leaves that fold this wreck in their repose.
Yet to the musing mourner thou shalt be
A mourner too, of glory gone, while he
Leans on thy shattered walls, and drops a tear
O'er the lost hopes of many a happy year,
Till loitering long, he treads his tear-wet way,
Nor sees the twilight come though daylight fades away.

"THE YOUTHFUL WARRIOR."

"My charger stands saddled—my comrades are gone—
They call me to follow where glory is won;
'Tis mine to be foremost in danger's career,
So give me thy blessing, and spare me that tear."

"My son, though this heart is now widowed and old,
'Tis thy country that summons, I will not withhold;
My blessing thou hast—mid the strife of the field
Be the GOD of our fathers thy guardian and shield!"

"Then fare thee well, mother, and banish thy fears,
I'll play a man's part, though a stripling in years;
My armour, now burnish'd and silvery bright,
In the blood of the foe shall be gilded ere night."

He springs on his charger, his spurs in his side—
He's off in the strength of his manhood and pride—
From the causeway the hoofs of his war-steed strike fire,
And hope in his bosom burns higher and higher.

The battle is over, and hushed is the strife,
But where's he who entered it buoyant with life?
'Mid yon heap of carnage that festers the skies,
Go seek him—a prey to the raven he lies!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

EFFECT OF IMAGINATION ON THE PHYSICAL FRAME.

MANY years ago, a celebrated physician, author of an excellent work on the effects of imagination, wished to combine theory with practice, in order to confirm the truth of his propositions. To this end, he begged the Minister of Justice to allow him to try an experiment on a criminal condemned to death. The minister consented, and delivered to him an assassin of distinguished rank. Our *savant* sought the culprit, and thus addressed him:—"Sir, several persons who are interested in your family, have prevailed on the judge not to require of you to mount the scaffold, and expose yourself to the gaze of the populace. He has therefore commuted your sentence, and sanctions your being bled to death within the precincts of your prison; your dissolution will be gradual, and free from pain."

The criminal submitted to his fate; thought his family would be less disgraced, and considered it a favour not to be compelled to walk to the place of public execution. He was conducted to the appointed room, where every preparation was made beforehand; his eyes were bandaged; he was strapped to a table; and, at a preconcerted signal, four of his veins were gently pricked with the point of a pen. At each corner of the table was a small fountain of water, so contrived, as to flow gently into basins placed to receive it. The patient believing that it was his blood he heard flowing, gradually became weak; and the conversation of the doctors in an undertone, confirmed him in this opinion.

"What fine blood!" said one. "What a pity this man should be condemned to die! he would have lived a long time."

"Hush!" said the other: then approaching the first, he asked him in a low voice, but so as to be heard by the criminal, "How many pounds of blood are there in the human body?"

"Twenty-four. You see already about ten pounds extracted; that man is now in a hopeless state."

The physicians then receded by degrees, and continued to lower their voices. The stillness which reigned in the apartment, broken only by the dripping fountains, the sound of which was also gradually lessened, so affected the brain of the poor patient, that although a man of very strong constitution, he fainted, and died without having lost a drop of blood.

To die both young and good are Nature's curses,
As the world says; ask Truth, they are bounteous blessings;
For then we reach at heaven in our full virtues,
And fix ourselves new stars, crown'd with our goodness.
Fletcher.

THE PICTURE OF A PERIOD.

FREQUENTLY, about the commencement of the present century, the reports of the French having invaded, or being on the eve of invading, the country, resounded through the land, and agitated the people in an unprecedented degree. Not only did these alarms reach persons at the head of affairs, or who possessed the best means of ascertaining their truth and the magnitude of the threatened danger, but, wherever newspapers sped, or hearsay could be wafted, whatever was most dreadful or conjecturable was sure to penetrate, and was transmitted with a strength and terror that increased and accumulated at a rate proportioned to the dis-

stance at which the parties were placed in relation to the fountain of information.

In 1805, twelve summers had shone upon me, and therefore it may be fairly presumed that I retain a lively recollection of the state of feeling, and the style of conduct, that pervaded the immediate neighbourhood of my home at that remarkable epoch; for, although the place forms but a narrow section of our loyal and chivalrous territory, it may yet be taken as having formed a specimen that was illustrative of the entire empire. That home was situated in a sequestered corner of the Western Lowlands of Scotland, within a few miles of the expanded Clyde, but before it can rightfully

be designated the Ocean. Now the rumours of French invasion, like every other piece of news, never reached us until they were charged with all the accessories which it was possible to imagine; not only because the tidings were highly susceptible of the colourings which uncertainty allowed the ardent minds of a simple and intelligent peasantry to bestow on them, but because we dwelt upon a coast, and almost upon the margin of a magnificent crescent-bay, where a fleet of a thousand sail might ride at anchor, and where an immense army might be landed with all safety and expedition. A short description of our parish, and also of the precise situation of my father's house, may serve to lend effect to some of the succeeding details.

The parish of ———, occupies two extensive ridges, which, in a tamer country, would obtain the name of lofty hills. These, with their intervening and adjacent valleys, on the Water of ———, form what may be termed the ground-plan of the whole. The stream may be said, indeed, to divide, by an impartial and equal process, this specified section of land. It runs from east to west; and though, at the higher boundary of the parish, it consists of a series of waterfalls, occasioned by the rugged uplands which interrupt the view of all who, from the lower district, turn their eyes towards the interior, its channel, ever after, till losing itself in the sea, maintains the moderate and measured course of descent which the character of a gentler scenery and gradual declivity allows. It also happens that the lateral ridges spread and decline as they approach the coast, till they terminate at the lower extremity in a number of lessening eminences, into which the long and majestic sweep of the hills divides at last.

Now, the inhabitants of this picturesque parish—whether they dwell in the peaceful and neat village that is chiefly pitched upon a bank of land within the embrace of a very large curvature of the stream, which, from its peculiar shape, is called the *Crook*, or upon the tops and sides of the lateral ridges, or in the adjacent and intervening valleys, can, with scarcely a single exception, behold the far-rolling Clyde, without stepping many yards' length from their thresholds. Imagine, then, what sort of alarms and speculations were likely to agitate the bosoms of a home-loving people, when two or three of them might meet together and comment on the fresh tidings which had, perhaps, but a few hours before, reached them from afar, from London, through some of the domestics of Captain D——, the only inhabitant of the parish who treated himself to a metropolitan newspaper! These speculations generally consisted of improvements upon the exaggerations just promulgated, and were most effectively transmitted from one to another of the church-goers on Sunday, during the interval between the morning and afternoon services. The knots of whispering politicians that might be seen studding the churchyard in those days, had an appearance not more perfectly rustic than eager for information, while every member of each group was sure to carry to his own fireside all that he had heard, there to be farther re-enlarged. The Sabbath, indeed, and the spot, as well as the parties that were connected or identified with rumours that were sometimes direful and sometimes the theme of triumph, tended to give emphasis and importance to the conceptions of a people so single-hearted, imaginative, and ardent as the well-educated pea-

santry of Scotland are allowed to be. Then, think again, what must have been their comments and conjectures, when, on an unrestricted evening, they met in little groups on the hill-sides or in the vales, and speculated, while casting their eyes westward, where, before the sun should once more rise, a mighty flotilla might be spread!

Nay, like wildfire, more than once the rumour ran at midnight, that the enemy were in the bay, and putting on shore myriads of troops, nothing short of indiscriminate massacre and insatiable rapine being the woes instantly looked for. And though, on an occasion of the sort, the only cause of alarm had been taken from a moonlight glimpse of a few straggling craft from the Islands, that had stealthily stood in for the bay to discharge a quantity of illicitly-distilled whisky, yet nothing less than the morning sun could dissipate the illusion.

It was in 1805, I believe, that some of the most active preparations were made, or were reported to be made, by the French, for the avowed purpose of invading Great Britain. The flotilla at Boulogne was said to be vastly increased, and an army of 100,000 well-disciplined troops, put under the command of a renowned general, together with all the proper appurtenances for such an enterprise, it was added, were kept in constant readiness to be wafted, in a marvellously short space of time, to our peaceful shores. But such was the dread lest our country, which had been so long unprofaned by foreign foes, should be thus visited, and such the patriotism and the spirit of resistance which animated the nation, that the number of volunteers trained to military service speedily amounted to 300,000. My native parish, of course, furnished its quota; nor was my father's house behind in the expression of ardour, or the extent of sacrifices.

For two centuries my predecessors had been farmers, and during the greater and latter portion of that time they had rented the same lands which my father occupied, with credit to themselves, and benefit to the community. Indeed, the result of their continuous industry was the purchase, by my grandfather, of the farm so long held in lease by the family. This lay on the slope looking southward of one of the lateral ridges already mentioned as guarding the intersecting stream. Here my father was born, and here he died. Here it was that, out of five sons, four at one time belonged to the parish volunteers, each of them entering the service with alacrity and zeal, though the years of the youngest of the four, at the time he donned the red coat, scarcely enabled him to shoulder his musket.

Well do I remember the day, or rather the affecting evening hour, when, in family conclave, my eldest brother devoted himself, and was consecrated by his parents, to the office of defending his native land. It was immediately after Government had called for a prompt enlargement of the volunteer force, and when the threatened danger was considered to be the most imminent. The solemnity of which I speak took place on a Sabbath eve, just after the whole family had gathered and composed themselves around the cheerful kitchen hearth, as was our wont on the sacred evenings; but never more sedately and thoughtfully than on the occasion mentioned; for none of us had ever known or heard of a season of such unusual excitement and momentous forelooking in the annals of our parish. Even in his afternoon discourse of that same day,

our venerable pastor had addressed himself explicitly and wholly to the signs and exigencies of the time, and, with more than his wonted fervour, pathos, and eloquence, he had striven to spirit on his flock to active and immediate measures. He spoke, at the close, to this effect:—

"Waste not your hours, my dear children and brethren, in vain laments and speculation, but rather, in the scourge that menaces us, recognise the teachings of a Father, who wills that we should be tried, in order that those who are at ease, and falsely secure in Zion, may be aroused, and that the pious may be invigorated in their pilgrimage to another and a better world. This is not the period when glad tidings from earthly potentates are proclaimed. We must reverse the language of the prophet, and turn our ploughshares into swords, and our pruning-hooks into spears. The Corsican threatens: he may be within our gates ere another moon lightens our land. Were I of the young and the robust, I would respond to my beloved Sovereign's call, and buckle on the weapons of war without a day's delay. I would come, if the danger required it, to this watch-tower, for heaven's King, wearing the insignia and accoutrements for mortal conflict, believing that he well serves God, who faithfully loves and strenuously defends his neighbour and country. But, though stricken in years, I will not, if life and health be vouchsafed to me, be a mere looker-on. Let my equals in age, the elders of the congregation, assemble with me in this sacred house to-morrow and take counsel together. It is not property, nor limb, nor name, nor nation, that are alone in jeopardy, but our religion."

In this strain did the holy and zealous man address his flock,—indignant, tender, and magnanimous by turns,—arousing all who listened to him to an unwonted pitch of patriotic enthusiasm. On the preceding day, Captain D——, who was the principal resident proprietor in the parish, had convoked a meeting of the able-bodied inhabitants, and appealed to them in a different though harmonious tone, as indeed became an old military officer. But the veteran's address required to be backed by our revered pastor, as was most effectually done; for, before a fortnight had elapsed, many in the parish were, not only in principle, but practice, in heart, and habit, volunteer-recruits.

But, to return to my father's fireside:—

"Robert," said he, to the eldest of his children, "what think you of it?" alluding thus indefinitely in point of terms to that which each one present felt to be too well understood to require a fuller enunciation.

My mother spoke first, and interposed something like a doubt respecting the suitableness of the discussion for the Sabbath, though, perhaps, her main idea was, to evade its probable termination. But she was instantly silenced by my father's announcement, that the Sabbath would not protect us against the invasion of the usurper and infidel.

"Will you, Robert," continued he, "fight for our kindred and country, our religion and heritage?"

"I shall be a volunteer," was the firm and prompt reply.

"And I,"—"and I,"—"and I," were the rapid sequences of the three immediately junior brothers, who were divided from the eldest by slight and gradual stages in the matter of years. But the strongest emotion attended our father's deliberate

and resolute declaration, when he added, "I also shall be of the armed host;" for she, whom it most concerned, arose to withdraw, only able to articulate, "And I am to be a widow and childless!"

"No, Marion," my father replied, "you and our youngest will tend our flocks, and keep a home for the survivors when they return from battle."

Thus ended that evening's colloquy, on which the simple but overcharged hearts of a united family, who spoke under the influence of solemnized and exaggerating fancies, mingled their yearning and patriotic emotions, in a manner not more alien to their ordinary intercourse and style of speech, than illustrative of the spirit that pervaded the "period."

If I remember rightly, in the self-same week that thus opened, about fifty of the likeliest men and youths of our parish enrolled themselves as volunteers. Only two of my brothers, however, at this early date, joined the corps; more matured reflection, and my mother's sway, rendering a larger sacrifice at the time unadvisable, at least as regarded the most efficient of the armed volunteer associations of that precise time; for I must not forget to do my father's courage and consistency justice, and to state that he was as good as his first declaration promised, becoming a strenuous supporter of our reverend and venerable pastor, at the Monday meeting named from the pulpit. Nor were there fewer than thirty grey-headed men in this association of *ancients*, some of whom, though hale and vigorous, could number threescore and ten winters. This corps took to themselves the imposing title of "The Army of Reserve;" but the wags of the parish dubbed them "The Hams," in allusion to the sort of domestic *onslaught*, or guardianship rather, which they were the most likely to perform. Their armour consisted of spears or pikes, of formidable length. Nor did these bands exhaust the whole of our pugnacious volunteers; for a goodly number of boys, of an age like my own, incontinently took to imitating their elders in everything that their rivalry and ingenuity could reach; and, indeed, they played at *soldiers* with marvellous dexterity, especially in wheeling, marching, and counter-marching; their wooden muskets and tin bayonets being, as in the case of other pretenders, more formidable to the eye than effective if put to action. These were not yet all the associations which banded in my native parish at the "period."

There was, at the time I speak of—the time of the intensest alarm—an association of an anomalous kind, and which might appropriately be denominated, "The Army of Totals." This force consisted of old and young, grandfathers and grandchildren—embracing men, women, and children; in short, it partook of all those who were capable of any exertion or sort of service, and who had not enrolled themselves among the fighting volunteers. This heterogeneous army was constituted in the following manner, and for the following purposes:—

As it was deemed possible that an invading army might land on the adjacent coast, the most influential men of the district went from house to house, and put it to men and women how and what they were likely or willing to act in the case of such a dire emergency. It was at the same time explained that to cut off all the means of supply which the enemy might calculate upon would become an imperative duty; and that, therefore, all the grain and provisions which could not be conveyed to the interior, would have to be destroyed by the inhabitants

and owners themselves, while the cattle and flocks would have to be driven towards the moors and other inaccessible parts of the country. "Whether will you be a burner, a pioneer, a carrier, or a driver?" were questions which were propounded to every one who was unable or unwilling to carry arms; and the answers were regularly taken down, that it might be known who and what were to be calculated upon. Was that, then, not a strange "period," when such a rural and peaceful population thus distributed and organized themselves? And may we not demand of the scoffer at our national valour, or of him who ridicules the ardour of an untrained and inexperienced peasantry, how was such a people to be vanquished and altogether crushed?

Such were the associations that instantly started into activity in our sequestered, and once so tranquil, parish. In truth, a strange transition suddenly took place, yet one which it is impossible for a native of these kingdoms to regard with other than high emotions of gratulation and pride. How changed was the aspect which it gave, even to every-day life, compared to a period of profound repose and consciousness of security! At first, from Monday to Saturday, whatever might be the usual pursuits of the parties, or the state of the weather, there might be seen, during some portion of almost every day, squads of athletic or promising young men, parading and manœuvring away at the command of a driller. "The Army of Reserve" was for a season equally on the alert with their juniors; nor were the signs of the times less characteristically manifested by the youngsters who played the part of imitators; the various associations finding ample and well-sheltered scope for their various evolutions within the pleasure-grounds of Captain D—; and while he commanded the most efficient corps, and his son was at the head of the juveniles, the Rev. Dr. B—, with unsurpassed zeal, figured as the leader of "The Hams."

Rapid was the progress which all who were skilled in military affairs allowed that these different bodies made in the art of war. To be sure, the juveniles were chiefly remarkable for their buoyancy of spirit, and the longing to be men; and truly some of them, a few years later, bled in the battle-fields of foreign lands, where the great conflict was maintained. "The Army of Reserve" was, considering all circumstances, worthy of admiration; for, although the light-headed might laugh at them, there was a view in which their zeal was magnanimous and affecting. Was it not touching as well as curious to see those *ancients*, many of whom had never beheld a whole regiment in their lives, all at once assume a dress which bore a military sign, and submit to be paraded and exercised like ordinary recruits for the regular and standing army? although it was not very easy to set in proper array, and reduce to military uniformity, a band of men, where the stooping and the stiff-jointed had to *fall in* with the spindle-shanked and the pot-bellied. But, to confine myself to the efficient corps that was generally understood in the district by the term "Volunteer" at the "Period."

The patriotic feelings, the apprehension of danger, and the sense of duty, which at first induced many a young man to offer himself as a military defender of his home, his neighbourhood, and his country, happily, when the excitement that origi-

nally stimulated him had subsided, acquired other adjuncts which lent zest, support, and favour to the volunteer establishment. It was indeed impossible for a number of persons, who all belonged to a limited or definite circle, and whose grade in life and habits of thinking were much akin, to associate frequently upon the same concern, without originating new ideas and sentiments, more enlarged ties, and more emulating suggestions. The very exercises necessary to be studied and oft-repeated, to go no further than the uses of a manly pastime, had their peculiar and salutary results. The gait, bearing, and manners which were hence begotten amongst a body of rustics, were indications of more extensive and permanent benefits than at first were contemplated. How often have I seen my four brothers, with some of their fellow volunteers, assemble in my father's barn, and disport, as well as improve themselves according to military rule, to the entertainment, aye, and the instruction, of the old and the young who looked on. Be assured, the practice which these homely drillings imposed upon each in his turn, merely in the matter of giving the words of command, was not fruitless of proper things. The loud laugh, the expression of approval, the lesson that was bestowed according to the accuracy and style of the parties,—say of the temporary officer,—whether it regarded the precision of his eye, the modulation of his voice, or the smart sententiousness of his words, did not go for nothing. There was, however, one special collateral benefit which attended the "Period," but which was nowhere developed in a more pleasing and appreciable manner than in the parish of my birth; and to this I would particularly refer.

We had, in like manner with every other considerable section of society, several young men of sprightly spirit, of ingenious talent, of eager emulation, who were sure to take the lead in any new enterprise, where honour and improvement were to be earned. Of all the acquirements, however, of which we could boast, that in the department of vocal music was the most remarkable, as compared with the neighbouring rural districts. Towards this eminence our worthy pastor had been a great contributor, as he was not only skilled in the art, frequently solacing himself by discoursing with his violin, but had been at pains, winter after winter, to invite a teacher of some note to assist and guide all who desired to take lessons, whether in singing, or in the use of certain delightful instruments. Indeed, the band which conducted the psalmody in our parish church, had become so excellent as to breed a sort of schism amongst us; some of the most old-fashioned and uncompromising adherents of the Covenant denouncing the innovation as a remnant of Popery,—so that they either absented themselves from the house of God altogether on this account, or kept their lips sealed during the psalm-singing,—afraid of joining in a profanation. But who could have conjectured that these prejudices were utterly to be put to flight by the spirit and incidents of the "Period?" Yet it was so, and thus it was:—

No sooner was the corps of our stalwart volunteers organized, than our gifted and gallant lads bethought them of an instrumental band, for the performance of martial music and spirit-stirring marches, to grace and exalt the character of their order. And now the enlightened interpreters of

the purposes and beauties of church melody and harmony, feeling the value of the accident, promptly and munificently seconded the fitting enterprise; thus carrying off the laurels on a contested subject that had occasioned a split amongst the zealous; for it was now conceded that that which refined and sublimated the hearts of the people in the cause of an earthly prince's soldiery, could not be unbecoming, as a handmaiden of devotion, in the good fight of faith. In these circumstances funds were not wanting to procure competent teachers, and the necessary instruments; and the rapid advancement made by our ardent lads was such, as soon to command the universal admiration and delight even of the dullest amongst us.

What a drumming and fifeing, bugling and braying, were there sent forth over hill and dale by those performers in the course of their practisings, evening after evening! Crowds or groups of the people might be seen here and there, at such stirring or touching hours, listening with aroused delight, or melted as by a mysterious power. Without exaggeration I can attest, that never did the power of music, where I might judge, work more signal results. On no other occasions, at least, has my own bosom experienced such tumultuous emotions at one time, as well as subdued and purified sentiments at another, as in those seasons of my young romance, when of a summer's eve our sprightly youths, stationed in the embowered privacy of their captain's pleasure-grounds, drew from their instruments notes which spoke to every faculty of the soul, carrying one beyond himself into spheres dreamt not of in ordinary hours, when there is nothing to inspire and sustain the careering imagination. I know that the mystic power failed not to sweep with swelling or fitful cadence,—echoed through the quiescent air, or borne upon the fitful blast,—over the uplands, and athwart the hill's side, where stood my father's house, there to touch some bosoms within the precincts of that sanctuary of love and virtue, with many an undefinable but ennobling impulse. The resoundings through the woods, and the echoings from rock to rock, or valley to valley, that I have listened to in those days, and in that peaceful haven, often in my latter history, when I was alone, or among strangers, or care-worn, or discomfited in spirit, have seemed to speed over the interval, and to thrill within the secret chambers of my nature some sentiment long unstrung, making me to partake of the pristine enjoyment—the conscious assurance of the identity affording a satisfaction not less gratifying, perhaps, than the recollected pleasure was itself.

It was not to be expected that any very considerable length of time should elapse, before some one of our volunteers should be called away from this scene of anxiety and exertion. For the first twelve months, however, after they had been embodied, not a single gap was made by the stroke of death. But when the earliest breach took place, the parish was extraordinarily moved.

James Moreton was the eldest son of one of the Captain's tenantry, and died of a lingering decline. For months, however, after this insidious disease had fastened upon him, he continued to attend every drill. He had been a strong young man, and was one of the most enthusiastic of our volunteers; and he seemed to refuse to own submission to the fell enemy. It was distressing to see how he strove to go through the necessary manœuvres, when he had

not the strength to handle his arms with certitude, so eager was he to keep up with his comrades. At length, it being summer, he was only able to march with them to the exercise-ground, and then, leaving the ranks, he would recline himself till the drum beat for their return to the village to be dismissed. And neither few nor vague were the inquiries and the attentions to which he was, in the honest sympathy of the old and young onlookers, subjected. The Captain's device of making his men perform their most interesting evolutions within the close inspection of the invalid, was one of the most delicate expressions of kindness.

That, however, which I have chiefly upon my heart, with respect to the first-departed of the corps, is to speak of his funeral. As already indicated, the people had been much transformed by means of the volunteer institution; and one of the most striking proofs of this fact occurred, when it was proposed by the Captain that the burial should be conducted according to military form and fashion, for the idea was eagerly adopted and cordially approved of. Was it not strange that such an innovation should be tolerated among the primitive, and, in solemn matters, austere Presbyterian community? But it was the "Period,"—the epoch when the sympathies of all, whether of a gladsome, or magnanimous, or distressful kind, were in unison or borne along with the ideas of the country's defence and renown.

That the bereaved father, who was a very plain, staid man, should have acceded to the extraordinary proposal, afforded the most striking instance of how speedily and wholly the soldier-system might be engrafted, when alarms arise, upon the most retired and unpretending peasantry. Here was the last duty that falls to the lot of man to perform to man, which, even among Scotland's severe simplicities, is one of the simplest, about to be distinguished by many formalities and much parade, in a corner of the land where no such thing had ever been witnessed, at least for generations, merely because the entire population had put on, if not the soldier's garb, the feelings and associations of the soldier's life.

The funeral of James Moreton, which in usual circumstances would have been as noiseless and unostentatious as is possible, where a number of mourners congregate to give to the churchyard a new tenant, was to form an era in our parochial registry. The senseless clay was to be borne shoulder high,—the great body of the funeral train were to wear a martial uniform, carrying the weapons of earthly conflict, and marching to the roll of the muffled drum. But most arresting of all was the moment when the musketry announced that the grave had received its new charge,—that the funeral obsequies were completed. What a course mantled the gravestones and walls of our decent churchyard on that astounding occasion! The people were greatly moved while only anticipating the ceremony; how much more when immediate witnesses of its celebration! Eyes that swam in tears sparkled and became dilated as if sudden inspiration had entered their souls. Their irrepressible emotions might be construed from the ejaculations which escaped some of them. I overheard an old man say, when the volleys rent the air,—“The day of battle is surely near at hand;” and a female, equally sententious and prophetic, improved upon this, and said,—“Jamie Moreton hears not

this; nor will he awake when the fight may be over his ashes; but when the last trump sounds, Jamie shall come forth from that grave, to join, I doubt not, the army of the saints."

Not a little talk has in 1845 been expended about the preparedness of Great Britain to resist an invasion by a foreign foe. I have only to say, in concluding a "Picture" drawn according to facts, of a past "Period," that I firmly believe and trust that patriotism and effort, that sacrifices and scenes, meriting far higher colouring than I can bestow, would be furnished in the parish where I first saw the light, and in every part of the land, to the utter dismay and discomfiture of the enemy.

TWO DAYS IN THE TYROL.

(SECOND PAPER.)¹

THIS, as it is the finest part, is the end of the glen—and, indeed, it seems as if, at one time, there had been no opening here, till somebody cut a slice out of the hill in order to make a passage—so instantaneously does the whole aspect of nature change. The stream, which, but a moment before, foamed so turbulently over the black rocks, now murmurs smoothly along, a placid brook, over a bed of level sand; the gloomy gorge opens out into a wide valley, the undulating green slopes of which are studded with the neat little cottages of the village of Gosau. But look there—beyond the valley, and the dark fir-trees which clothe its extremity—there, far in the distance to the left; look at those magnificent mountain peaks springing to heaven—they are many in number, though all belonging to one mountain, and far higher than any we have seen. But we walk on a little further, and further yet,—and, at every step, from behind the shoulder of the puny envious hill beside us, appears another and another peak, each higher, more pointed, and more sublime than its brethren; at length we see the last and the noblest—full ten thousand feet in height; and there is the Dachstein, the glorious corner-stone of Austria. No common hill is that with rounded top, a mere heap of earth—but a vast mass of wild serrated rocky needles—sharp, jagged, and broken, and deserving, indeed, the name of mountain. But yet, though one could rather believe them the rocky clouds of a summer sunset than *bona fide* stone, those peaks stand out clear and distinct from the blue sky, their proud mantle of snow glittering white and glorious, till the rays of the setting sun, seen no where else, fall on them, and reddening gradually the whole snow-clad cluster, become of a lovely rosy hue. Verily it is no wonder that, in the olden time, men went up to the tops of the highest hills to pray, for who that saw those roseate spires but might fancy that they formed a staircase up to heaven, and that the immortals descended to that gorgeous throne to view the doings of earth? It was, indeed, a magnificent scene—that green valley, and the stupendous mountain beyond, and none of us could repress a cry of delight at its beauty; besides, we were very hungry, and knew our supper must be at hand.

It was not a very difficult business, the discovery of

the inn; for there is only one, and that, luckily, at the nearest end of the village. We were met at the door by the landlord, a steady respectable looking man, who said we could have anything or everything for supper. The everything resolved itself into eggs and "kalbschnittel." What this last was we none of us exactly knew; but, being aware that it must be something having affinity to veal, we ordered it. Whilst dinner was preparing, our host advised us to amuse ourselves by looking at the prospect from the "lusthaus" outside. We repaired thither, and found the "lusthaus" a perfect fac-simile of what the fair daughters of London, who frequent the tea-gardens, would call a "lovely harbour." It was constructed of willows, joining overhead; a wooden seat ran round the bower, and in the middle stood a table, which was figured, or disfigured, by the stains of beer. To complete the illusion, there was a skittle-ground beside it, and we had the pleasure of seeing a game of skittles played in a manner which would not have done discredit to Old England's peasantry. The string of affecting recollections which these objects aroused was broken by the call to dinner. We found the "kalbschnittel" neither more nor less than veal cutlets, served up in a very seducing under-current of garlic, potatoes, &c. Our room was small, and coarsely furnished, but clean and neat; there was but one other occupant, whom we at once knew, by that indescribable something which always points out an Englishman, to be a countryman, and over our pipes an acquaintance was soon made. He was one of that class whom one is always proud to see abroad—a thorough specimen of an English gentleman—young, high bred, well educated, and opulent, yet without the slightest tinge of pretension. He had been travelling on foot for the last three or four months through Switzerland and the Tyrol, knapsack on his back, and staff in hand, and, though evidently accustomed to the best society, cared nothing for all those nameless little inconveniences which one suffers in travelling through uncultivated regions. This is a class of men whom foreigners cannot understand; they can comprehend and envy the *magnifico* style of travelling adopted by some of our countrymen, with more money than brains; they can comprehend, too, that a person should travel *à la pedestrian* who cannot afford to do otherwise; but it puzzles them altogether to understand why a person should submit to such hardships who can afford to do otherwise.

The evening finished with a long chat, in which our plan of operations for the morrow was settled. We found that it was impossible, in our limited time, to get upon the glacier, which we had hoped to accomplish; all that could be done was to obtain a near view of it from the borders of a small mountain lake about twelve miles off; nearer than this, however, was another lake, described as extremely beautiful, and which we determined, at any rate, to see. These matters determined, we marched off to bed—no easy matter either—the road being up a dark staircase, and along a darker passage, both so low and narrow, that it was a perfect miracle how any one ever made the journey without breaking one of, or all, his limbs. However, the beds were excellent and clean, and what more does one want for a good night's rest, except, as old Franklin says, "a good conscience?" and this adjunct we luckily possessed also.

The next morning we were called, as usual, about two hours later than the time requested; but, on looking out of window, we soon discovered that the host had

(1) Continued from page 84.

had good reason for his dilatoriness—a drizzling wetting rain was pouring down, and the whole valley was shrouded in vapour. However, ere breakfast was over the rain had nearly ceased, the sky was almost clear, and, though the whole of the mountains were invisible, things looked so well that we started, carrying with us, as provision, six hard-boiled eggs apiece, bread, and a bottle of slibowitz. By the bye, this slibowitz is a liquor which should be known to every one travelling in this country; it is a kind of whisky, made from wheat, I believe. It is a little coarse, but makes by no means a bad dram, especially when one can't get brandy. We tried it also as toddy, and, considering the water was only lukewarm, and strongly impregnated with the combined flavour of garlic and tallow, it manufactured a very fair tippie. Slibowitz, too, shares in this convenient peculiarity of whisky, that you generally get it best in the most out-of-the-way places; in the great towns it is mostly miserable stuff, but in the little country inns we almost always found it excellent.

This village of Gosau forms a perfect contrast to that of Hallstadt; the houses, instead of being piled on one another in a heap, are scattered in ones and twos all about the valley, just as if an enormous giant had pulled some four or five score cottages from his pocket, and amused himself by scattering them about in all directions. The consequence is, that one has to walk two or three miles in passing through a small village. The people seem flourishing, however. The valley is portioned out into meadows and arable fields, and there are two churches, one Catholic, the other Protestant. We were, however, happy to learn that the people did not consider it necessary to revile and hate each other on account of the difference in creeds, but, on the contrary, were wise enough to live in charity and good-fellowship.

Twice, in passing along the valley, were we tempted to turn back; but we persevered, and were rewarded; for, on entering the fir-wood at the end of the open ground, the rain ceased, and though there was no prospect of a fine day, we hoped, at any rate, not to get wet through. The road is hideously bad; some parts are, as the Americans say, corduroyed; but it is difficult to decide which is worst walking, the thick slushy mud, or the slippery trunks of the small fir-trees, which pretend to afford a temporary protection. However, the scenery repaid us for our fatigue; the glen gradually widens, and through the interstices of the trees you perceive the tremendous precipices of black rock which border it on either side. This valley is, I understand, much prized by geologists as exhibiting some very curious phenomena in stratification. None of us were learned enough to appreciate these beauties; but even the most ignorant cannot but be struck by the spectacle displayed by the rocks at the upper end, where on one side the strata run perpendicularly, and on the other the same stone lies horizontally. How this is explained, or attempted to be explained, I know not; but it is a sight to excite the astonishment of every one. At length we emerged from the wood, and, scrambling up a deep gully, or ravine, came upon the first lake, or Vorder See, a fine sheet of water, surrounded to the edge by trees, and backed by splendid crags; but, alas! of these we could barely see the base. Here there is a small wooden boat-house, in which a consultation was held as to the propriety of going further. No one was willing to return; and, accordingly, after a first taste of the

slibowitz, we proceeded, skirting the right hand of the lake, until we reached its furthest point.

And now then for a pull indeed, and no mistake! The path becomes steeper and steeper at every step—the wet leaves, rotten and slippery, give way as you tread, and you sink into a mass of oozing mud—every now and then you have to cross a little stream, and take care that in jumping across you do not, after landing in the mire on the opposite side, tumble over on the rock beyond—the wet branches rustle as you pass by, and discharge a whole shower of rain-drops on your devoted head. And now comes the toughest of the whole—path there is none; and that which looks like one is only a road which some stream has made for itself amongst the huge stones. Your only method of proceeding, if you wish to avoid being choked in the slime of its bed, is to jump from one rock to another; and take care you don't break your leg, for who is to carry you home? "These are the delights," you grumble, "of coming a-pleasuring in the Tyrol." Never mind; look at the scene around—that is to say, looking where you step at the same time—the whole glen is rich with foliage and flowers, bending, no doubt, with the weight of the moisture, but lovely still. On your left hand, you can, even on such a day, admire the gigantic masses of rock, almost tumbling over you; and on your right, down fifty yards—take care, you are within a step, and don't see it—raves and gallops a stream which has its birth in the glacier of the Dachstein. And now the clouds are clearing away—the mist is rising, and there, there actually comes a sunbeam, dancing on the glistening boughs, as if welcoming them after their bath—and the fog gradually sways up and down, backwards and forwards, disclosing here a huge boulder, there an unfathomable fissure, and again, a magnificent pinnacle of rock. Hurrah! we shall see the old Dachstein yet—the lazy old fellow is taking off his nightcap, and rousing from his nap. And so, one more pull—scramble over that big rock, which has stuck itself right in the road—and now, here we are.

It was a magnificent, and at the same time extraordinary scene. We stood on the edge of a deep basin, surrounded by the rocks forming the base of the Dachstein. At our feet lay the lake, about a mile in circumference, and almost round in shape. The water was unlike any we had seen; it was, in colour, of a deep blue. All the other mountain lakes were green, but this looked like a huge wash-tub, in which a more than usual quantity of that which washer-women call *par excellence* "blue" had been steeped. On the other side the lake was a small patch of green, with a few stunted trees running up the hill-side; and close to the shore was a small cottage. A wilder place for habitation I cannot imagine; it looked as if shut in from all the world. Path on the left side of the lake to it there could be none, for the cliffs rose precipitously many hundred feet from the water. And even on the right there was dimly traceable only a sort of goat's track leading over rocks, apparently passable by that interesting quadruped alone. At the back rose the Dachstein in all its majesty—unappreciable in size, stupendous in grandeur. Almost all the peaks were now visible in the dull wet atmosphere; but so high and so distant, as to look as if they belonged to a separate world. Below those pinnacles, but still at a vast height, lay the huge glacier; a mighty field of green ice with deep yawning fissures. It seemed

almost as if the whole hillside were about to slide down and bury lake and all beneath. But we are in luck, for a moment the sun bursts out, lighting up the scene with a dim brilliancy, rendering the utter desolation still more striking. It is but for a moment; those gleams which contrasted so strangely with the gloom around vanish, the mist, rolling down in huge billows thickens gradually around, and you can see nothing a hundred yards higher than the water. The old Dachsenstein has been but scratching his pate after all; he has put on his night-cap again, and turned to slumber. And so now we begin to think whether we cannot reach the house yonder, and beg some milk to wash down our eggs. We resolved to try the before-mentioned path, and succeeded in getting round to the green plat on which the cottage stands; but such a scramble! how we got over it with unbroken necks I have never rightly understood. However, there is a proverb about inability to drown, which I suppose applies to dangers by land as well as by water.

We found the door of the cottage locked, and no one within. In despair we wandered along the margin of the lake, and came upon a small boat or canoe, and at the same time a boy made his appearance, as if by magic, a little way off. He approached when we beckoned, but seemed afraid of coming too near, and hovered about like a savage on a newly-discovered island. We spoke to him in the best German we could muster, requesting, first some milk, and, secondly, the loan of the boat, to carry us across the lake, for both which services we offered a *zwanziger* (about twenty-pence) in payment. He stared at us without answering, and we began to doubt whether he might not be a second edition of Peter the wild boy, and incapable of speech, when a voice shouted to him, and, looking in its direction, we perceived an old woman amongst the trees on the hillside, gathering sticks. Our young friend immediately hastened to her, and returning, spoke at length, and said, in scarcely intelligible language, that we could not have the boat. We were dumb with amazement, for we knew that our offer was a handsome one, and could not conceive how any one should be so foolish as to refuse so easy a service when payment was offered. Our gentleman took advantage of this astonishment to seize and retire with the only oar within our reach, thus rendering it impossible to make off with the boat on our own account.

We now held a short consultation as to whether, in case of an action for assault, we should not, under the circumstances, be held justified in seizing and forcibly taking from him the oar. But, in the meantime, the woman again called; the boy ran off to her, shouldering the oar as he went; and, on his return the whole mystery was explained. He stated, that if we would pay two *zwanzigers*, we might have the boat. Shocked at such an instance of depravity, we at once replied roundly in the negative, and proceeded to unpack our provisions. This steady behaviour had its effect; in a short time the woman appeared with a huge bowl of milk, and stated that we might have the boat for one *zwanziger*. Our lunch was accordingly discussed; the eggs and milk were excellent, and the *slibowitz* superb. But now the problem was to get our boat across the lake, for young hopeful offered no assistance. We had one oar indeed, but that of the kind used here; namely, a pole with a board at the end, intended, as I have before described, to be used by a person standing up, with his face to the bow. We all of us understood pulling a

little, but for this species of rowing we were quite incompetent: however, I seized it and shoved off; there was a baling dish and a couple of boards in the boat, and these were taken by the others to paddle with. Thus we got along, some how or other, the whole affair reminding us strongly of Robinson Crusoe, and the shipwreck of the *Medusa*, on a reduced scale, the boat, to add to the resemblance, being very leaky, and scarcely calculated to hold more than two. The labour, besides, was no joke, especially as we were the whole time roaring with laughter at our absurd turn out, and there really was some danger. However, we reached our destination at length, and started down the valley, again leaving our hearty malediction on the lady, and also the young gentleman of the lake. I may mention in passing, that this is the only instance of boorish incivility I ever met with in Germany.

Our walk home was of course a merry one—the *slibowitz* guaranteed that—but it was also rapid—for being all a steep descent and our method of locomotion a jump from stone to stone, it was best to do this as soon as possible, so as not to give oneself time for tumbling. Rapidly then we paced along the course of the little river, which we now knew to be merely a leakage from the great washing tub above, and reached the *Vorder See*—skirted its pleasant bank once more, and then plunged into the fir-trees of the lower glen. Here we had an opportunity of estimating the steepness of its sides. High up, almost at the top of the cliff, were some men rolling down the fir-wood, which had been cut for firing. The trees are divided into pieces of about ten feet long, and these are floated down the stream to the nearest town. So steep was the rock down which these logs were pushed by the wood-cutters above, that they rolled clattering and splintering, jumping and twisting, now knocking against each other, and now bumping over a projection, many hundred feet, into the very bottom of the valley, whilst the whole glen resounded with the noise of their descent.

So then we came again upon the green valley of Gosau, and passed through its long village, now seeming longer then ever—but we were to be rewarded: a smoking dish of *Kalbschnittel* awaited us, and over it we forgot our toils.

Meantime a most primitive vehicle was prepared for transporting us to Ischl again. It was a sort of four-wheeled cabriolet, with a hood, and a very small seat at our feet for the driver. It was furnished with a pole, but only one horse was put in. This method of harnessing is common in Germany, and the consequence is that one side of the carriage always seems to go faster than the other—another inconvenience is, that, as no allowance is made for the pole in guiding the horse it frequently knocks up against all sorts of things it is never intended to meet. Thus, I remember once in Cologne seeing the pole of a one-horsed carriage of this kind, on the horse being suddenly turned, run right up against the stern of a fat old woman, who was walking quietly along the street. It lifted her completely off the pavement, and I expected some serious damage would have been done—but no—she had been assaulted in her least vulnerable part, and on reaching the ground again walked quietly on without even turning round. They don't mind these things in Germany.

And now our dinner was finished; we shook hands with our countryman, paid our bill, and stepping into the carriage soon lost sight of Gosau. The little coach ran smartly along with us down the valley which we had come up the day before; we once more saw the lake of Hallstadt, and, passing rapidly by its lower extremity, tumbled along, in a half sleep, till the lights of Ischl once more glanced upon us.

POPULAR YEAR-BOOK.

June 23.—Midsummer Eve.

THE observances connected with the nativity of St. John the Baptist commenced, says a recent journalist, on the previous evening, called, as usual, The Eve, or Vigil of the Festival, or Midsummer Eve. On that evening the people were accustomed to go into the woods, and break down branches of trees, which they brought to their homes, and planted over their doors, amidst great demonstrations of joy, to make good the Scripture prophecy respecting the Baptist, that many should rejoice in his birth. This custom was universal in England till the recent change in manners. "On the vigil of St. John Baptist," writes Stow in his Survey of London, "and on SS. Peter and Paul the Apostles, every man's door being shadowed with green birch, long fennel, St. John's-wort, orpin, white lilies, and such like, garnished upon with garlands of beautiful flowers, had also lamps of glass, with oil burning in them all the night: some hung out branches of iron curiously wrought, containing hundreds of lamps lighted at once." This custom was designed to signify that St. John "was to be lantern of light to all people." Honest Master Stow also tells us that, upon Midsummer Eve, and the other "vigils of festival days," in June and July, "after the sunsetting, there were usually made bonfires in the streets, every man bestowing wood or labour towards them. The wealthier sort also before their doors, near to the said bonfires, would set out tables on the vigils, furnished with sweet bread, and good drink, and on the festival days with meats and drinks plentifully, whereunto they would invite their neighbours and passengers also to sit, and be merry with them, in great familiarity, praising God for his benefits bestowed on them." These "bonfires" appear to have been so named, because they were composed of contributions collected as *boons*, or gifts of social and charitable feeling. The custom of making them on Midsummer Eve has been practised in many nations, and is of remote antiquity. In mediæval times it was designed to commemorate (as Durandus says) St. John the Precursor, who was a burning and shining light, and also to drive away dragons and evil spirits. Some writers have ascribed to it a Pagan origin. A learned Frenchman affirms that the "St. John's fire" was a *Feu de Joie*, "kindled the very moment the year began, for the first of all years, and the most ancient that we know of, began at this month of June. These *Feux de Joie*," he adds, "were accompanied at the same time with vows and sacrifices for the prosperity of the people, and the fruits of the earth. They danced also round this fire, for what feast is there without a dance—and the most active leaped over it. Each, on departing, took away a firebrand, great or small, and the remains were scattered to the wind, which, at the same time that it dispersed the ashes, was thought to expel every evil. When, after a long train of years, the year ceased to commence at this solstice, still the custom of making these fires was continued by force of habit, and of those superstitious ideas that are annexed to it. Thus has the custom been continued and handed down to us." We have read how it was formerly observed by the Londoners. Barnabe Googe thus describes the manner of its general celebration in this country:—

... "Bonfires great, with lofty flame, in every town do burn,
And young men round about with maids do dance in every street,
With garlands wrought of motherwort, or else with vervain
sweet,
And many other flowers fair, with violets in their hands,
Whereas they all do fondly think, that whosoever stands,
And through the flowers beholds the flame, his eyes shall feel no
pain.
When thus till night they danced have, they through the fire
again,

With striving minds do run, and all their herbs they cast therein;
And then with words devout and prayers they solemnly begin,
Desiring God that all their ills may here consumed be;
Whereby they think through all that year from agues to be
free."

It has been affirmed that the leaping through or over the bonfires, alluded to in the above extract, is the oldest of all "known superstitions, and is identical with that followed by Manassah." We learn that, till a late period, the practice was retained in Ireland. Borlase states that in Cornwall bonfires are kindled on the Eve of St. John Baptist and St. Peter's Day; and Midsummer is thence, in the Cornish tongue, called "Goluan," which signifies both light and rejoicing. At these fires the Cornish attend with lighted torches, tarred and pitched at the end, and make their perambulations round their fires, and go from village to village, carrying their torches before them. Brand relates that there was formerly a great bonfire on Midsummer Eve, on St. Stephen's Down, near Launceston, in the above county. A large summer pole was fixed in the centre, round which the fuel was heaped up. It had a large bush on the top of it. Round this parties of wrestlers contended for small prizes. "An honest countryman," says our author, "who had often been present at these merriments, informed me that at one of them an evil spirit had appeared in the shape of a black dog, since which none could wrestle, even in jest, without receiving hurt, in consequence of which the wrestling was, in a great measure, laid aside. The rustics there believe that giants are buried in these tumuli, and nothing would tempt them to be so sacrilegious as to disturb their bones." Sir Henry Piers, in 1682, observes that in Ireland, on the Eves of St. John Baptist and St. Peter, they always have in every town a bonfire, late in the evenings, and carry about bundles of reeds fast tied and fired. These, being dry, will last long, and flame better than a torch, and be a "pleasing, divertive prospect to the distant beholder; a stranger would go near to imagine the whole country was on fire." Another writer on the "Emerald Isle" remarks, "On Midsummer's Eve every eminence near which is a habitation blazes with bonfires, and round these they carry numerous torches, shouting and dancing." The *Times* newspaper of June 29, 1833, gives an account of a riot at Cork in consequence of some soldiers refusing to subscribe money towards the fires which were to be lighted on the vigil of St. John. It appears from Brand's collections that the Eton scholars formerly had bonfires on St. John's Day, and that such were recently, or still continue to be, made on Midsummer Eve in several villages of Gloucester and Devonshire, in the northern parts of England, and in Wales.

"It was customary in towns," says a journalist before cited, "to keep a watch walking about during the Midsummer night, although no such practice might prevail at the place from motives of precaution. This was done at Nottingham till the reign of Charles I." Every citizen either went himself or sent a substitute, and an oath for the preservation of peace was duly administered to the company at their first meeting at sunset. They paraded the town in parties during the night, every person wearing upon his head "a garland, made in the fashion of a crown imperial, bedecked with flowers of various kinds, some natural, some artificial, bought and kept for that purpose, as also ribands and jewels." At Chester also the annual "setting of the watch" (as it was called) on St. John's Eve was an affair of great moment, and continued for many years after the Great Rebellion. Part of the pageant on this occasion consisted of four giants, one unicorn, one dromedary, one camel, one dragon, and six hobby-horses, with other figures. In London, during the middle ages, the marching "watch," comprising not less than two thousand men, all in bright armour, paraded both on this night and on the eve of the feast of SS. Peter and Paul. This must certainly have been a splendid sight.

In the procession were standard and ensign-bearers, sword-players, trumpeters on horseback, archers in coats of white fustian. Their bows bent in their hands, with sheafs of arrows by their sides; pikemen in bright corselets, the *waites* of the city, and morris dancers, the lord mayor, and sheriffs, "pageants," giants, and coustables, each of whom wore a chain of gold, "his henchman following him, his minstrels before him, and his cresset light passing by him." These cressets, or torches, carried in barred pots on the tops of long poles, added to the bonfires in the streets, must have given the town a remarkable appearance in an age when there was no regular street-lighting. A London poet in 1616, looking back from that period, thus alludes to the spectacle:—

"The goodly buildings that till then did hide
Their rich array, open'd their windows wide,
Where kings, great peers, and many noble dame,
Whose bright pearl-glittering robes did mock the flame
Of the night's burning lights, did sit to see
How every senator in his degree,
Adorn'd with shining gold and purple weeds,
And stately mounted on rich trapped steeds,
Their guard attending, through the streets did ride,
Before their footbands, graced with glittering pride
Of rich-gilt arms, whose glory did present
A sunshine to the eve, as if it meant,
Among the cresset lights shot up on high,
To chase dark night for ever from the sky.
While in the streets the sticklers to and fro,
To keep decorum, still did come and go,
Where tables set were plentifully spread,
And at each door neighbour with neighbour fed,
Where modest mirth, attendant on the feast,
With plenty, gave content to every guest."

The civic custom mentioned in the last two of the above stanzas has been already described. Henry VIII., in 1510, went "into Cheape" disguised as a yeoman of the guard, to behold the marching watch on St John's Eve, and was so well pleased with the ceremonial, that he came with Queen Catharine, and a noble retinue, to attend openly that on St. Peter's Vigil, a few nights after. This king, however, in the 31st year of his reign, prohibited this gorgeous pageant, probably from a dread of so great an array of armed citizens. It was revived in 1548 (for that year only) by Sir Thomas Gresham, lord mayor.

This Eve seems to have been consecrated from the highest antiquity to the performance of mystic rites, and some of the superstitions connected with it are of a highly fanciful nature. The Irish, we are told, believe that the souls of all persons on this night leave their bodies, and wander to the place, by sea or land, where death shall finally separate them from their earthly tabernacles. It is not improbable that this notion, and the opinion that to sleep on this vigil would ensure a wandering of the spirit, was originally universal, and was the cause of the wide-spread custom of watching or keeping awake on St. John's Eve; for we may well believe, observes a late writer, that there would be a general wish to prevent the soul from going upon that somewhat dismal ramble. In England, and perhaps in other countries also, it was believed that, if any one sat up fasting all this night in the church porch, he would see the spirits of those who were to die in the parish during the ensuing twelve months come to knock at the church door, in the order and succession in which they were to die. We can easily perceive a possible connexion between this dreary persuasion and that of the soul's midnight excursion. Grose relates that amongst a party who once sat up as above described, one fell into so sound a sleep that he could not be waked, and that whilst he was in this condition, his ghost, or spirit, was seen by his companions knocking at the sacred portal. The same antiquary states that it was supposed that if an unmarried woman, fasting on Midsummer Eve, laid a cloth at midnight with bread and cheese, and sat down as if to eat, leaving the street-door

open, the person whom she was to marry would come into the room, and drink to her by bowing, after which, setting down the glass, with another bow, he would retire. It was usual on this vigil to gather certain plants which were supposed to have a supernatural character. Fern is one of those herbs which have their seed on the back of the leaf so small as to escape the sight. Our ancestors, from an extraordinary mode of reasoning, concluded "that they who possessed the secret of wearing this seed about them would become invisible." Young men would go out at midnight on St. John's Eve, and endeavour to catch some in a plate, but without touching the plant, an attempt which was often unsuccessful. Samuel Bamford, in his recently-published "Passages in the Life of a Radical," relates the following remarkable anecdote in relation to this practice, and states that he was told it by an actor in the events it records. A youth, named Bangle, of Old Birkley, was deeply enamoured of a young beauty, the daughter of a small farmer in the neighbourhood, and had been told by one Limping Billy, a noted seer residing at Radcliffe Bridge, that he had no chance of gaining power over the damsel unless he could take "St. John's fern seed," and, if he secured three grains of that, he might "bring to him whatever he wished that walked, flew, or swam." He agreed with two other persons, called Plant (Bamford's informant) and Chirrup, to gather the seed on Midsummer Eve; and accordingly, on the vigil in question, a little before midnight, the parties assembled in a deep valley, near the road to Manchester, ascending from Blackley, "greenswarded" and embowered in woods and plantations. The first word spoken was, "What hast thou?" "Mine is breawn an' roof," said Plant, in the Lancashire dialect, exhibiting a brown earthenware dish. "What hast thou?" he then asked. "Mine is breet enough," said Chirrup, showing a pewter platter, and adding, "What hast thou?"

"Teed wi' web an' woof
Mine is deep enough,"

said Bangle, displaying a musty dun skull, with the cap sawn off above the eyes, and left flapping like a lid by a piece of tanned scalp, which still adhered. The interior cavities had also been stuffed with moss, and lined with clay kneaded with human blood, and the youth had secured the skull to his shoulders by a twine of three strands—of unbleached flax—of undyed wool,—and of woman's hair, from which also depended a raven black tress, which a wily crone had procured from the maid he sought to obtain.

"That will do," said a voice in a half whisper, from one of the low bushes they were passing.

Plant and Chirrup paused; but Bangle said, "Forward, if we turn now a spirit has spoken we are lost, we are lost—come on," and they went forward. A silence like that of death was around them. Nothing moved either in tree or brake. Through a space in the foliage the stars were seen pale in heaven, and "a crooked moon hung in a bit of blue, amid motionless clouds." All was still and breathless, as if earth, heaven, and the elements were aghast. Gasping, and with cold sweat oozing on his brow, Plant recollected that they were to shake the fern with a forked rod of witch hazel (this, and the other parts of this strange observance had been prescribed beforehand by Limping Billy), and by no means must touch it with their fingers; and he asked in a whisper, if the others had brought one. On learning to the contrary, he soon procured what was wanted. The fern, "standing stiff and erect in a gleamy light," was now approached.

"Is it deep neet" (night)? said Bangle.

"It is," answered Plant,—

"The star that bids the shepherd fold
Now the top of heaven doth hold,"

and they drew near. All was still and motionless. Plant knelt on one knee, and held his dish under the

fern. Chirrup held his broad plate next below, and Bangle knelt and rested the skull directly under both, on the green sod, the lid being up. Plant said,—

"Good St. John, this seed we crave,
We have dared; shall we have?"

A voice responded—

"Now the moon is downward starting,
Moon and stars are all departing;
Quick, quick; shake, shake;
He whose heart shall soonest break,
Let him take."

They looked, and perceived by a glance that a venerable form, in a loose robe, was near them. Darkness came down "like a swoop." The fern was shaken; the upper dish flew to pieces; the pewter one melted; the skull emitted a cry, and eyes glared in its sockets; light broke; beautiful children were seen walking in their holiday clothes, and graceful female forms sang mournful and enchanting airs. The men stood terrified and fascinated; and Bangle gazing, bade "God bless 'em." A crash followed; strange and horrid forms appeared from the thickets; the men ran "as if sped on the wind"—they separated and lost each other. Plant, leaping a brook, cast a glance behind him, and saw terrific shapes, some beastly, some part human, and some hellish, gnashing their teeth and howling, and uttering the most fearful and mournful tones, as if wishing to follow him, but unable to do so. In an agony of terror he arrived at home, not knowing how he got there. For several days he was in a state bordering on unconsciousness; and when he recovered, he learned that Chirrup was found on a neighbouring swamp, called the White Moss, raving mad, and chasing the wild birds. Bangle found his way to his abode over hedge and ditch; running with supernatural and fearful speed,—the skull's eyes glaring at his back, and the nether jaw grinning and jabbering frightful and unintelligible sounds. He had preserved the seed, however, and having removed it from the skull, he buried the latter at the cross-road from whence he had taken it. He then carried the spell out, and his proud love stood one night by his bed-side, in tears. But he had done too much for human nature; in three months after, she followed his corpse, a real mourner, to the grave.

In addition to the awful St. John's fern, persons formerly gathered on this night the rose, St. John's-wort, vervain, trefoil, and rue, all of which were thought to have magical properties. They placed the orpine in pots and shells upon timber, slates, or trenchers, daubed with clay, in their houses, calling it a *Midsummer man*. As the leaves were found next morning to bend to the right or left, the anxious maiden "knew whether her lover would prove true to her or not." Young women also sought for what they called pieces of coal, but, in reality, certain hard, black, dead roots, often found under the living mugwort, with the intention of placing these under their pillows, that they might dream of their lovers. Some of these divinations are mentioned in the "Connoisseur," a periodical paper of the middle of the last century:—"I and my two sisters tried the dumb cake together. You must know, two must make it, two bake it, two break it, and the third put it under each of their pillows (but you must not speak a word all the time), and then you will dream of the man you are to have. This we did; and to be sure I did nothing all night but dream of Mr. Blossom. The same night, exactly at twelve o'clock, I sowed hempseed in our back yard, and said to myself,—'Hempseed I sow, hempseed I hoe, and he that is my love come after me and mow! Will you believe me? I looked back, and saw him behind me, as plain as eyes could see him. After that, I took a clean shift and wetted it, and turned it wrong-side out, and hung it to the fire upon the back of a chair; and very likely my sweetheart would have come and turned it right again (for I heard his step), but I was frightened and could not help speaking, which broke the

charm. I likewise stuck up two *Midsummer men*, one for myself and one for him. Now if his had died away, we should never have come together; but I assure you his bowed and turned to mine. Our maid Betty tells me, that if I go backwards, without speaking a word, into the garden upon Midsummer Eve, and gather a rose, and keep it in a clean sheet of paper, without looking at it till Christmas day, it will be as fresh as in June; and if I then stick it in my bosom, he that is to be my husband will come and take it out." Gay, in one of his Pastorals, says—

"At eve last Midsummer no sleep I sought,
But to the field a bag of hemp-seed brought.
I scattered round the seed on every side,
And three times, in a trembling accent, cried :—
'This hemp-seed with my virgin hand I sow,
Who shall my true love be, the crop shall mow.'
I straight looked back, and, if my eyes speak truth,
With his keen scythe behind me came the youth."

A poem, published in 1786, notices the gathering of the rose, and wearing it on Midsummer Eve, as one of the modes in which a girl seeks to ascertain the sincerity of her lover's vows :—

"The moss-rose that, at fall of dew,
(Ere eve its dusky curtain drew.)
Was freshly gather'd from its stem,
She values as the ruby gem;
And, guarded from the piercing air,
With all an anxious lover's care,
She bids it, for her shepherd's sake,
Await the new-year's frolic wake,
When, faded in its alter'd hue,
She reads—the rustic is untrue!
But, if it leaves the crimson paint,
Her sickening hopes no longer faint;
The rose upon her bosom worn,
She meets him at the peep of morn,
And lo! her lips with kisses prest,
He plucks it from her panting breast."

Our space will only allow us to allude to three or four other customs connected with Midsummer Eve. In Northumberland it is usual to dress out stools with a cushion of flowers. A layer of clay is placed on the stool, and therein is stuck, with great regularity, an arrangement of all kinds of flowers, so close as to form a beautiful cushion. These are exhibited at the doors of houses in the villages, and at the ends of streets and cross-ways of larger towns, where the attendants beg money from passengers, to enable them to have an evening feast and dancing. At Ripon, in Yorkshire, every house-keeper who, in the course of the year, has changed his residence into a new neighbourhood, spreads a table before his door with bread, cheese, and ale, for those who choose to resort to it. The guests, after staying awhile, if the master can afford it, are invited to supper, and the evening is concluded with mirth and good humour. The origin of this practice is unknown; but it probably was instituted for the purpose of introducing new comers to an early acquaintance with their neighbours. It closely resembles the ancient civic hospitalities of this season.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. VIII.

It was not until I had proceeded the length of two or three streets, that I could collect my ideas sufficiently to form anything like a just estimate of the extraordinary revelations to which I had so unexpectedly become a party—and no sooner had I in some measure succeeded in so doing, than the puzzling question presented itself to me, what line of conduct it would be advisable to adopt, in consequence of what I had heard.

I asked myself, too, to begin with, what right had I to make any use of a private conversation, with which accident alone had caused me to become acquainted? Would not people say I had behaved dishonourably in having listened to it at all? But then again, by preserving Cumberland's secret, and concealing his real character from Oaklands, should not I, as it were, become a party to any nefarious schemes he might contemplate for the future? Having failed in one instance in his attempt on Oaklands' purse, would he not (having, as I was now fully aware, such a strong necessity for money,) devise some fresh plan, which might succeed in its object, were Oaklands still ignorant of the real character of the person he had to deal with? And in such case should not I be answerable for any mischief which might ensue? Nay, for aught I knew, some fresh villainy might be afloat even now; what plan could Spicer have been urging, which Cumberland seemed unwilling to adopt, if not something of this nature, which might be prevented were Oaklands made aware of all the circumstances?

This last idea settled the business. I determined to reveal every thing to Oaklands in confidence, and to be guided in my subsequent conduct by his opinion. Having once arrived at this conclusion, the next thing was to carry my intentions into effect with as little loss of time as possible. I consequently started off in a homeward direction as fast as my legs could carry me, and succeeded in reaching my destination in rather less than ten minutes, having, at various times in the course of my route, run against and knocked over no less than six little children, to the manifest discomposure and indignation of as many nursery-maids, who evidently regarded me as a commissioned agent of some modern Herod, performing my master's work zealously.

On arriving at home my impatience was doomed to be disappointed, for Oaklands, who had gone out soon after I did, was not yet returned. This delay, in the feverish state of anxiety and excitement in which I was, appeared to me intolerable; and, unable to sit still, I kept striding up and down the room, clenching my fists, and uttering exclamations of impatience and vexation; which unusual conduct on my part so astonished and alarmed the worthy Thomas, that, after remaining in the room till he had exhausted every conceivable pretext for so doing, he boldly inquired whether "I did not feel myself ill, no how?" adding his hope that "I had not been a-exhaling laughing gas, or any sich rum-bustical wegitable?" after which, he favoured me with an anecdote of "a young man as he know'd, as had done so, wot conducted hisself more like a mad fool than a Christian, ever after." Perceiving at length that his attentions were rapidly reducing me to the same state of mind as that of his friend, he very considerably left me.

After half an hour of anxious expectation, in the course of which I must have walked some mile or two over Dr. Mildman's parlour carpet, Oaklands and Lawless returned together. I instantly called the former aside, and told him I wished to speak to him alone, as I had something of importance to communicate to him. To this he replied that it was very near dinner-time, but that, if I would come up to his room, I could talk to him while he dressed. As soon as we were safely closeted together, I began my relation, but scarcely had I got beyond "You asked me to go to the billiard rooms, you know"—when a hasty footstep was heard upon the stairs, some one knocked at the door, and immediately a voice, which I knew to be that of Cumberland, asked to be let in, "as he had something particular to say."

"The plot thickens," said Oaklands, as, without rising from his seat, he stretched out an immense length of arm, and opened the door. "Hear what I have to say first," cried I—but it was too late, and Cumberland entered, breathless, and with his usually sallow complexion flushed with exercise and excitement. "The most unfortunate thing"—he began, and stopping to draw breath, he added, "I have run all the way from the

post office, as hard as my legs would carry me—but I was going to tell you,—as I went down, I met Curtis of the —th, who told me their band was going to play in Park Square, and asked me to go with him to hear it, and I'm afraid that, as I stood in the crowd, my pocket must have been picked, for when I got to the post, I found that my letter, my pocket handkerchief, and I am sorry to say, your letter also had disappeared—so, remembering you had told me your letter was of importance, I thought the best thing I could do was to come home as fast as I could, and tell you." "By Jove," exclaimed Oaklands, "that's rather a bore though; there was my father's cheque for 300*l.* in it; I suppose something ought to be done about it directly." "Write a note to stop the payment; and—let me see—as it is too late for the post now, if you will make a parcel of it, I'll run down and give it to the guard of the mail, begging him to deliver it himself as soon as he gets to town,—the cheque can't be presented till to-morrow morning, so that will be all right." "What a head you have for business, to be sure!" said Oaklands; "but why should you have the trouble of taking it? I dare say Thomas will go with it, when we have done dinner, or I can take it myself." "Nay," replied Cumberland, "as I have contrived to lose your letter, the least I can do is to take the parcel; besides, I should like to speak to the guard myself, so as to be sure there's no mistake."

While this was going on, it may be imagined that my thoughts were not idle. When Cumberland mentioned the loss of the letter, my suspicions that some nefarious scheme might be on foot began for the first time to resolve themselves into a tangible form, but, when I perceived his anxiety to have the parcel entrusted to him, which was to prevent the payment of the cheque, the whole scheme, or something nearly approaching to it, flashed across me at once, and without reflecting for a moment on what might be the consequences of so doing, I said, "If Oaklands will take my advice, he will not entrust you with any thing else, till you can prove that you have really lost the letter, as you say you have done." Had a thunder-bolt fallen in the midst of us, it could scarcely have produced greater confusion than did this speech of mine. Oaklands sprang upon his feet, regarding me with the greatest surprise, as he asked, "If I knew what I was saying?" while Cumberland, in a voice hoarse from passion, inquired, "what the devil I meant by my insolence? what I dared to insinuate he had done with the letter, if he had not lost it?" "I insinuate nothing," was my reply; "but I tell you plainly that I believe, and have good reason for believing, that you have not lost the letter, but given it to your gambling friend and accomplice, Captain Spicer, who, in return for it, is to give you a receipt in full for the 200*l.* you owe him, and 50*l.* down." On hearing this, Cumberland turned as pale as ashes, and leaned on the back of a chair for support, while I continued, "You look surprised, Oaklands, as well you may, but, when you hear what I have to tell, you will see that I do not make this accusation without having good grounds to go upon." "I shall not stay here," said Cumberland, making an effort to recover himself, and turning towards the door, "I shall not remain here, to be any further insulted; I wish you good evening, Mr. Oaklands." "Not so fast," said Oaklands, springing to the door, and locking it; "if all this be true, and Fairleigh would not have said so much, unless he had strong facts to produce, you and I shall have an account to settle together, Mr. Cumberland; you will not leave this room, till I know the rights of the affair—now, Frank, let us hear how you learned all this." "Strangely enough," replied I; and I then gave him an exact account of all that had passed at the billiard-rooms, repeating the conversation, word for word, as nearly as I could remember it, leaving Oaklands to draw his own inferences therefrom. During the whole of my recital, Cumberland sat with his elbow resting on the table, and his face buried in his hands, without offering the slightest interruption, scarcely indeed

appearing aware of what was going on, save once, when I mentioned the fact of the door between the two rooms being slightly open, when he muttered something about "what cursed folly!" When I had finished my account, Oaklands turned towards Cumberland, and asked, in a stern voice, "What he had to say to this statement?" Receiving no answer, he continued—"But it is useless, sir, to ask you: the truth of what Fairleigh has said is self-evident—the next question is, What's to be done about it?" He paused for a moment as if in thought, and then resumed—"In the position in which I now stand, forming one of Dr. Mildman's household, and placed by my father under his control, I scarcely consider myself a free agent. It seems to me, therefore, that my course is clear; it is evidently my duty to inform him of the whole affair, and afterwards to act as he may advise. Do you agree with me, Frank?" "It is exactly what I should have proposed, had you not mentioned it first," was my answer. "For God's sake, Oaklands, don't," exclaimed Cumberland, raising himself suddenly; "he will write to my uncle,—I shall be expelled,—it will be utter ruin;—have pity upon me,—I will get you back your money, I will indeed, only don't tell Mildman." "I have treated you up to the present time as a gentleman and a friend," replied Oaklands; "you have proved yourself unworthy of either title, and deserve nothing at my hands but the strictest justice; no one could blame me were I to allow the law to take its course with you, as with any other swindler, but this I shall be most unwilling to do; nothing short of Dr. Mildman's declaring it to be my positive duty will prevail upon me. But our tutor ought to be informed of it, and shall: he is a good, kind hearted man, and if his judgment should err at all, you may feel sure it will be on the side of mercy. Fairleigh, will you go down and ask Dr. Mildman if I can speak to him, on a matter of importance, now, at once? you will find him in his study. Let me know when he is ready, and we will come down; for," added he, turning to Cumberland, "I do not lose sight of you till this business is settled one way or other."

When I had told my errand, Dr. Mildman, who looked a good deal surprised, and a little frightened, desired me (on receiving my assurance that the business would not do as well after dinner,) to tell Oaklands to come to him immediately. To this Oaklands replied by desiring me to hold myself in readiness for a summons, as he should want me presently. Then, linking his arm within that of Cumberland, he half-led, half forced him out of the room. In another minute I heard the study-door close behind them.

"Now, Fairleigh," said Dr. Mildman, when, in about a quarter of an hour's time, I had been sent for, "I wish you to repeat to me the conversation you overheard at the billiard-room, as nearly word for word as you can remember it." This I hastened to do, the Doctor listening with the most profound attention, and asking one or two questions on any point which did not at first appear quite clear to him. When I had concluded, he resumed his inquiries, by asking whether I had seen the parties who were speaking. To this I answered in the negative. "But you imagined you recognised the voices?" "Yes, sir." "Whose did you take them to be?" "One I believed to be Cumberland's, the other that of a Captain Spicer, whom I had seen when I was there before." "How often have you been there?" "Twice, sir; once about a week ago, and again to-day." "And have you the slightest moral doubt as to the fact of the persons you heard speaking being Cumberland and this Captain Spicer?" "Not the slightest; I feel quite certain of it." "That is all clear and straightforward enough," observed Dr. Mildman, turning to the culprit; "I am afraid the case is only too fully proved against you; have you anything to say which can at all establish your innocence?" "It would be of no use if I were to do so," said Cumberland, in a sullen manner; "it is all a matter of assertion; you choose to believe what they say,

and, if I were to deny it, you would not believe me without proof, and how can I prove a negative?" "But do you deny it?" inquired Dr. Mildman, regarding him with a clear, scrutinizing look. Cumberland attempted to speak, but, meeting Dr. Mildman's eye, was unable to get out a word, and turned away, concealing his face in his handkerchief. "This is a sad piece of business," said Dr. Mildman; "I suppose you mean to prosecute, Oaklands!" "I shall be most unwilling to do so," was the reply; "nor will I, sir, unless you consider it my positive duty. I would rather lose the money ten times over than bring such a disgrace upon Cumberland." "You are a kind-hearted fellow," replied the Doctor; "it really is a very difficult case in which to know how to act. As a general principle, I am most averse to anything like hushing up evil." "For Heaven's sake have pity upon me, Dr. Mildman," cried Cumberland, throwing himself on his knees before him; "I confess it all. I did allow Spicer to keep the cheque; he threatened to expose me, and I did it to escape detection; but promise you will not prosecute me, and I will tell you where he may be found, so that something may be done about it yet. I will pay anything you please. I shall come into money when I am of age, and I can make some arrangement. I don't care what I sacrifice, if I have to dig to earn my bread, only do not disgrace me publicly. Remember, I am very young, and oh! if you knew what it is to be tempted as I have been! Oaklands, Fairleigh, intercede for me; think how you should feel, either of you, if you were placed in my situation!"—"Get up, Mr. Cumberland," observed Dr. Mildman, in a grave impressive manner, "it is equally needless and unbecoming to kneel to man for forgiveness—learn to consider that position as a thing set apart and sacred to the service of One greater than the sons of men. One, whom you have indeed grievously offended, and to whom, in the solitude of your chamber, you will do well to kneel, and pray that He who died to save sinners from their sin, may in the fulness of His mercy, pardon you also"—he paused, and then resumed—"we must decide what steps had better be taken to recover your cheque, Oaklands; it is true we can send and stop the payment of it—but if you determine not to prosecute, for Cumberland's sake, you must let off this man Spicer also, in which case it would be advisable to prevent his presenting the cheque at all, as that might lead to inquiries which it would be difficult to evade. You said just now, you knew where this bad man was to be found, Mr. Cumberland?" "Yes, sir, if he is not at the billiard-rooms in F— Street, his lodgings are at No. 14, Richmond Buildings," said Cumberland. "Aye, exactly," replied Dr. Mildman; and resting his head upon his hand, he remained for some minutes buried in thought. Having at length apparently made up his mind, he turned to Cumberland, and said, "Considering all the circumstances of the case, Mr. Cumberland, although I most strongly reprobate your conduct, which has grieved and surprised me more than I can express, I am unwilling to urge Oaklands to put the law in force against you, for more reasons than one. In the first place, I wish to spare your uncle the pain, which such an exposure must occasion him; and secondly, I cannot but hope that at your age, so severe a lesson as this may work a permanent change in you, and that at some future period you may regain that standing among honourable men, which you have now so justly forfeited, and I am anxious that this should not be prevented by the stigma which a public examination must attach to your name for ever. I will therefore at once go with you to the abode of this man Spicer, calling on my way at the house of a legal friend of mine, whom I shall try to get to accompany us. I presume we shall have no great difficulty in procuring restitution of the stolen letter, when the culprit perceives that his schemes are found out, and that it is consequently valueless to him. Having succeeded in this, we shall endeavour to come to some equitable

arrangement of his claims on you—do you agree to this?" Cumberland bowed his head in token of assent, and Dr. Mildman continued—"And you, Oaklands, do you approve of this plan?" "It is like yourself, Doctor, the perfection of justice and kindness," replied Oaklands, warmly. "That is well," resumed Dr. Mildman; "I have one more painful duty to perform, which may as well be done at once—you are aware, Mr. Cumberland, that I must expel you?" "Will you not look over my fault this once?" entreated Cumberland; "believe me, I will never give you cause for complaint again." "No, sir," was the reply; "in justice to your companions I cannot longer allow you to remain under the same roof with them: it is my duty to see that they associate only with persons fitted for the society of gentlemen, amongst whom, I am sorry to say, I can no longer class you. I shall myself accompany you to town to-morrow, and, if possible, see your uncle, to inform him of this unhappy affair. And now, sir, prepare to go with me to this Captain Spicer:—on our return you will oblige me by remaining in your room during the evening. Oaklands, will you ask Lawless to take my place at the dinner table, and inform your companions that Cumberland has been engaged in an affair, of which I so strongly disapprove, that I have determined on expelling him, but that you are not at liberty to disclose the particulars. I need not repeat this caution to you, Fairleigh; you have shown so much good sense and right feeling throughout the whole business, that I am certain you will respect my wishes on this head."

I murmured some words in assent, and so ended one of the most painful and distressing scenes it has ever been my fate to witness.

The dinner passed off heavily; every attempt to keep up a continued conversation failed entirely; and a general feeling of relief was experienced when the time arrived for us to retire to the Pupils' room. Even here, however, the state of things was not much better. Lawless and the others, having in vain attempted to learn more of the affair from Oaklands and myself than we felt at liberty to tell them, lounged over a book, or dozed by the fire; whilst we, unable to converse on the subject which alone engrossed our thoughts, and disinclined to do so upon any other, were fain to follow their example. About half-past eight, Dr. Mildman and Cumberland returned, and, after dinner, which was served to them in the Doctor's study, Cumberland retired to his room, where he remained during the rest of the evening. Oaklands then received a summons from the Doctor, and, on his return, informed us that (as we had already heard) Cumberland was to be expelled. He added that Dr. Mildman intended to take him to town himself the next morning, as he was anxious to see Cumberland's uncle, who was also his guardian: he would probably, therefore, not return till the following day, in consequence of which we should have a whole holyday, and he trusted to us to spend it in a proper manner, which, as Coleman remarked, proved that he was of a very confiding disposition indeed, and no mistake.

When we went up to bed, Oaklands beckoned me into his room, and, as soon as he had closed the door, gave me an account (having obtained Dr. Mildman's permission to do so) of the interview with Spicer. They found him, it seemed, at his lodgings, preparing for his departure. At first he took a very high tone, denied the whole thing, and was extremely blustering and impertinent; but on being confronted with Cumberland, and threatened by Dr. Mildman's legal friend with the terrors of the law, he became thoroughly crest-fallen, restored the 300*l.* cheque, and consented, on the payment of 50*l.* in addition to the 50*l.* he had already received, to give up all claims upon Cumberland, whereupon they paid him the money down, made him sign a paper to the above effect, and left him.

"And so, my dear Frank," said Oaklands, "there is an end of that affair, and, if it only produces as much

effect upon Cumberland as it has produced upon me; it will read him a lesson he will not forget for many a long day. I blame myself excessively," he continued, "for my own share in this matter; if it had not been for my easy, careless way of going on, this scheme would never have been thought of—nay, I might, perhaps, have been able to have rescued Cumberland from the hands of this sharper; but in this manner we neglect the opportunities afforded us of doing good; and Frank," he continued, with a sudden burst of energy, "I will cure myself of this abominable indolence:"—he paused for some minutes in thought, and then added, "Well, I must not stand here raving at you any longer; it is getting very late: good night, old fellow! I shall be glad enough to tumble into bed, for I'm as tired as a dog: it really is astonishing how easily I am knocked up." The absurdity of this remark, so immediately following the resolution he had expressed with so much energy but a minute before, struck us both at the same moment, and occasioned a fit of laughter, which we did not check till we recollected with what dissonance any approach to mirth must strike the ear of the prisoner (for such he was in fact, if not in name), in the adjoining apartment.

"Now, sir! come, Mr. Fairleigh, you'll be late for breakfast," were the first sounds that reached my understanding on the following morning:—I say, understanding, as I had heard, mixed up with my dream, sundry noises produced by unclosing shutters, arranging water jugs, &c. which appeared to my sleep-bewildered senses to have been going on for at least half an hour. My faculties not being sufficiently aroused to enable me to speak, Thomas continued, "You'll be late, Mr. Fairleigh;" then came an aside, "My wig, how he does sleep! I hope he ain't been taking laudelum, or morpheus, or any thing of a somnambulous natur'. I wouldn't be master, always to have six boys a weighing on my mind, for all the wealth of the Ingies.—Mr. Fairleigh, I say!" "There don't make such a row," replied I, jumping out of bed; "is it late?" "Jest nine o'clock, sir; Master and Mr. Cumberland's been gone these two hours. Shocking affair, that, sir; it always gives me quite a turn when any of our gents is expelled; it's like being thrown out of place at a minute's warning, as I said to Cook only this morning. 'Cook,' said I, 'life's a curious thing; there's —' "the breakfast bell ringing, by all that's unlucky," exclaimed I; and down stairs I ran, with one arm in, and one out of my jacket, leaving Thomas to conclude his speculations on the mutability of human affairs as he best might, *solus*.

"How are we going to kill time to-day?" inquired Oaklands, as soon as we had done breakfast. "We mustn't do any thing to outrage the proprieties," said Coleman; "remember we are on *parole d'honneur*." "On a fiddlestick," interrupted Lawless; "let's all ride over to the Duke of York, at Bradford, shoot some pigeons, have a champagne breakfast, and be home again in time for the old woman's feed at five o'clock. I dare say I can pick up one or two fellows to go with us." "No," said Oaklands, "that sort of thing won't do to-day. I quite agree with Freddy, we ought not to do any thing to annoy the Doctor upon this occasion; come, Lawless, I am sure you'll say so too, if you give it a moment's thought." "Well, he's a good old fellow in his way, I know, but what are we to do then? something I must do, if it's only to keep me out of mischief." "It's a lovely day; let us hire a boat, and have a row," suggested Coleman. "That's not against the laws, is it?" asked Oaklands. "Not a bit," replied Coleman; "we used to go pulling about like bricks last summer, and Mildman rather approved of it than otherwise, and said it was a very healthy exercise." "Yes, that will do," said Lawless; "I feel savage this morning, and a good pull will take it out of me as well as anything. Now, don't go wasting time; let's get ready, and be off;" and accordingly in less than half an hour we were prepared and on our way to the beach. "How are we

going to do it?" inquired Lawless; "you'll take an oar Oaklands?" Oaklands replied in the affirmative. "Can you row, Fairlegh?" I answered that I could a little. "That will do famously, then," said Lawless; "we'll have a four-oar; Wilson has a capital little boat that will be just the thing; Freddy can steer, he's a very fair hand at it, and we four fellows will pull, so that we need not be bothered with a boatman: I do abominate those chaps, they are such a set of humbugs." No objection was made to this plan; Lawless succeeded in getting the boat he wished for; it was launched without any misadventure, and we took our places, and began pulling away merrily, with the wind (what little there was,) and tide both in our favour.

Palm Leaves.

THE PIOUS DERVISH.

A DERVISH, who was well known for his holy manner of life, went one day into a confectioner's shop. The owner hastened to serve the holy man in the best manner, and placed before him a vessel full of honey. Scarcely was it uncovered when a swarm of flies settled upon it, and the confectioner seized a brush to chase them away. The flies which had rested on the edge of the vessel easily saved themselves; but the greater number, whose curiosity had enticed them to venture inside, became entangled in the honey, and so fell a prey to the confectioner's besom.

The Dervish observed this scene with attentive looks, and, after some reflection, thus commented upon it:—"This vessel is the earth; the flies are its inhabitants. Those who remained on the edge are the wise, who know how to place a boundary to their enjoyments; the mass, who flew into the honey, are those unwise ones, who give the rein to their inclinations, and follow after pleasure without reserve. When the sudden wing of the angel of death passes over the earth, the men who stood as it were on the edge of the vessel, immediately disentangle themselves, and take their ready flight to heaven; but the slaves of excess and self-indulgence sink deeper into the mire of their sins, and become an easy prey to the evil one."

THE WATER OF LIFE.

THE prophet Solomon once complained of the shortness of human life. "Of what use to me is my great wisdom," said he, "if I am not permitted to reap the fruit of it? The greater part of my life was gone before I attained it, and now that I begin to use my experience, I find myself on the borders of the grave. What is human wisdom but a transitory flower? Many days and weeks pass by before the bud unfolds itself: no sooner is the blossom expanded than it fades away; it is not given it to see the fruit of its existence."

So spoke the Prophet, sorrowing; then lifting up his eyes, he saw an angel from heaven, bearing a vessel made of sapphire in his hand. "Solomon," said the messenger from above, "I come from the throne of the Eternal. He has heard thy complaint, and lo, I am sent to bring thee the Water of Life; by it thou may'st become immortal and enjoy eternal youth, but, if thou refuse to drink it, then, when thy time is come, thou wilt go the way of all flesh. The Eternal has placed the choice before thee: do that which seemeth best in thine

eyes." The angel placed the vessel at the feet of the Prophet and disappeared. Solomon was undecided what to do, so he assembled his viziers and took counsel with them. They advised him, with one accord, to become immortal, but, because Butimar, the wisest of his viziers was absent, the Prophet desired him to be called, and laid the question before him.

"Great king," answered Butimar, "is this water of life given to thee alone, or may others partake of it with thee?"

"The Most High has granted this favour to me alone."

"Then," returned the vizier, "will thy wives, thy children, and thy friends, one after another die away from thee. Like a tree which is every year despoiled of its fairest fruit, thou wilt, every year, every week of thy life, have to lament the death of a beloved one. What charm can there be in an immortality which brings with it unceasing sorrow? If everything thou lovest is not to endure as well as thyself, then would an immortal life become an everlasting misery."

"Thus also do I think," said the Prophet; "this earth is not made to bear immortal children, else would the sun remain immovable in the midst of heaven. My lamentation was unreasonable. A wise man dwelling for ever in this valley of fools, and bearing for ever the chain of earthly desires, without seeing the end of such a winding passage; that man would be the most unhappy creature found beneath the sun."

When the Prophet returned, the water in the vessel was dried up. He knelt down and said, "Lord, forgive Thy servant if he blamed Thy works; with Thee alone there is wisdom and understanding. Through them thou hast ordered all things; what can the son of the dust do but praise Thy works?"

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

ARION:

MRS. TOOGOOD.

COME listen, ladies! listen, knights!
Ye men of arms and glory!
Ye who have done right noble deeds,
Aye love the poet's story,
As minstrels love the warriors bold,
And joyfully sing their fame,
O'er warriors' hearts the poet's tale
Shall peaceful triumphs claim.

From distant lands Arion came,
From wandering far and long,
With gifts and gold,—for princely hearts
Denied no gift to song.
The song that cheered the saddest woe,
The tale that sings of youth,
Flowing sweetly, flowing on,
Thro' labyrinth of truth.

Rich tributes had been poured on him,
Arion far renowned,
And fair and gentle loved the rule,
Of one by nature crowned.

(1) See Illustration, p. 113.

But what can gifts and what can gold,
Or Fame's loud peal avail,
Wandering from his childhood's home,
His own Corinthian vale?

O Corinth, let me hear thy seas,
Thy home-borne tones once more,
And bless thy gods, and once again
Kneel thankful on thy shore:—
Yet cheer those eyes that weep alone,
The heart that loves me well;
What has the dim world's wealth for me,
Far from that sunny dell?

Corinthian shall my sailors be,
Then safe my hoarded store;
For generous and bold and true
The sons fair Corinth bore.
They shall repeat thy cherished name,
Recall the joys gone by,
The smiling scene of hope's young life,
To ravish'd memory.

And gaily blew the joyous wind,
And sung among the sails,
The breeze came by as breath of life,
In those home-bounding gales.
He, lost in thought, hangs o'er the prow,
The past with him alone,
And murmuring childhood's melody,
To the singer's soothing tone.

Meanwhile they eye his gems askance,
Askance they eye his gold,
Dark glance interpreted dark glance,
And bloody thoughts unfold.
They will seize their prey—their tiger hearts
Thirst for the poet's store;
Unburied cast him to the wave,
That yields her dead no more.¹

"Ah—spare my life," Arion cried,
"Corinthians, hear my prayer!"
But iron resolve had sealed his heart,
Nor wealth nor life to spare.
"I will sing a song, and a last long song,
And ye shall hear my lay;
I will deck me in the princely robe,
Won on a festal day."

He robed him in his broidered robe,
His brow a garland bound,
Like bright Apollo, wondrous fair,
When gods stand listening round.
He woke his harp—forth streamed the notes,
And echo softly gave
A cry of joy, and music floats,
Rejoicing o'er the wave.

Down dash'd he to his faithful sea,
Immortal guardians near,—
And swift an encircling host surround
One to the gods most dear.
A dolphin gleamed in golden scales,
Among the frothy foam,
And bore him glorying on her way,
Safe to his long-loved home.

A lovelier sight was ne'er beheld
Upon the grass-green sea,
Than when o'er billows and their spume
They bounded fearlessly.
The Ocean's king Arion rode,
Leading a Nereid train,
Calm in his godlike graceful pride,
Upon his wild domain.

(1) "To die destitute of burial" was considered one of the greatest misfortunes by the Greeks; and, of all forms of death, shipwreck, in which the body was swallowed up by the deep, was thought the most terrible. They were possessed with the opinion, that their souls could not be admitted into the Elysian shades till the body was committed to the earth; and that, if they never obtained burial, the time of their exclusion from the receptacle of ghosts was no less than a hundred years.

Now sculpture hastes with eager hand
Her magic art to ply,
Recording with a sister's love
This deed of poesy.
At Tanarus the Dolphin stands
With fair Arion's form;
His magic harp in his bending hand,
Amid the battling storm.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

DISCOVERY OF WINE.

DR. HENDERSON, in his "History of Ancient and Modern Wines," gives the following account of the discovery of wine, on the authority of a Persian MS. The Persian emperor who founded Persepolis, being extremely fond of grapes, put some into a jar to preserve them; tasting them while they were fermenting, he found them so bad that he put them back, and marked *poison* on the jar. His favourite mistress, from some cause weary of life, drank the liquor, which, the fermentation being at an end, was so pleasant as to reconcile her to life, instead of poisoning her. The king found out what had taken place, and thus wine was discovered.

ORIGIN OF THE WORD "QUIZ."

VERY few words ever took such a run, or were saddled with so many meanings as this monosyllable; and, however strange the word, it is still more strange that not one of our lexicographers, from Bayley to Johnson, ever attempted an explanation, or gave a derivation of it. The reason is very obvious; it is because it has no meaning, nor is it derived from any language in the world ever known, from the Babylonish confusion to this day. When Richard Daly was patentee of the Irish theatres, he spent the evening of a Saturday in company with many of the wits and men of fashion of the day. Gambling was introduced, when the manager staked a large sum that he would have spoken all through the principal streets of Dublin by a certain hour next day, Sunday, a word having no meaning, and being derived from no known language; wagers were laid, and stakes deposited. Daly repaired to the theatre, and despatched all the servants and supernumeraries with the word, "Quiz," which they chalked on every door and shop-window in town. Shops being shut all next day, every body going to and coming from their different places of worship saw the word; and every body repeated it, so that "Quiz" was heard all through Dublin. The circumstance of so strange a word being on every door and window, caused much surprise; and ever since, should a strange story be attempted to be passed current, it draws forth the expression, "You are quizzing me."

REMARKABLE VOLCANIC PHENOMENA.

THE SANTORINI ISLES AND THE PEAK OF JEYDA.

THE combustile matter which causes eruptions does not appear to be universally diffused throughout the earth, but is collected in particular spots, districts, or regions, and disposed in beds or veins of smaller or greater dimensions, since volcanoes appear either in groups, or in lengthened ranges, or extended lines. Thus, Iceland and its neighbourhood present one group, whilst the Andes of America form a lengthened range of volcanic action. Although the subterranean con-

nexion of the several members of any group is sufficiently evident, it does not follow that ignition should take place in all at once; on the contrary, eruption probably takes place only in that part of the vein or bed which undergoes chemical decomposition, consequently one volcanic crater of a group or line will be in a state of activity, whilst the others lie dormant or have become entirely extinct.

Extinct volcanoes are generally found at a considerable distance from the sea, whilst those that are most active are in its immediate vicinity; and many of them

are actually *submarine*, or situated in the very bed of the ocean. When a volcano bursts beneath the waters of the sea, the substances thrown up often rise above the surface, forming rocks and islands; such has been the case throughout every ocean on the globe. This interesting phenomenon took place in the Santorini Islands, in the Grecian Archipelago. It has been handed down by the ancients, that all these islands sprang from the bosom of the ocean, and this opinion is rendered probable by occurrences of different epochs of modern date. New islands were produced by the action of subterranean fires, appearing, intersecting, separating the old ones; sometimes coming close to them, and at times actually united with them, till some violent convulsions, similar to that which had first expelled them from the depths of the sea and thrown them up to the surface, again swallowed them up, and made them wholly to disappear.

The eruption, with the effects of which we are best acquainted, is that which occurred, to the consternation of the inhabitants of those islands, in 1797. On the 23rd of March of that year, the commencement of the new island was visible from the whole coast of Santorino. The first persons who perceived it imagined that it was the wreck of some vessel, and hastened to the shore to plunder; but what was their astonishment to find a mass of rocks rising from the watery depths and spreading over the surface! This phenomenon had been preceded by an earthquake, which, indeed, was the only alarming sign that heralded it. This, however, sufficed to diffuse amongst the inhabitants a consternation, that the current traditions of former disastrous consequences seemed to justify.

Fear soon gave place to curiosity; some Greeks were bold enough to land upon this new shore. They found its surface to be of a very white and very soft stone; but what is still more remarkable, they saw a quantity of fresh oysters, which are scarcely ever known at Santorino. They were busily engaged gathering them up, when they felt the ground move and rise under their feet, carrying them with it. Terrified, they leaped into their boat; and a very few days after, the new island had increased twenty feet in height, and to nearly double its first breadth. It continued for two months receiving fresh additions, which it frequently lost suddenly. Enormous rocks borne on the surface of the waves, showed themselves, disappeared, and then again appeared to swell its size; but a new and still more curious and terrible phenomenon was preparing.

In the month of July there suddenly appeared, about sixty paces from the White Island already thrown up, a chain of black and calcined rocks, which were soon followed by a torrent of thick and whitish smoke. This smoke spread a fearful infection, and, wherever it penetrated, the silver and copper were blackened, and the inhabitants immediately suffered from violent headaches, accompanied by vomitings. Some days afterwards, the neighbouring waters became hot, then boiling, and a great quantity of dead fish were found upon the shore. A dreadful noise was heard in the bowels of the earth, lengthened flashes of fire proceeded from the sea, and the rocks vomited forth by these fires formed into accumulated masses, and joined themselves to the first island, which, however, still preserved, for some time, its white colour. From that moment the mouth of the volcano was continually casting forth torrents of fire and burning rocks, a shower of pumice-stones covered the sea, and all the neighbouring islands. The inhabitants of Santorino were obliged to seek shelter in dens and caves.

The dreadful roar and redoubled peals of subterranean thunder, enormous rocks thrown upwards even to the skies, sulphureous torrents dyeing the waters, and fiery waves extending over the surface of a boiling sea,—all united to form a picture at once sublime and fearful. It continued for nearly a whole year; at length the fire abated, and there remained only a thick smoke.

The 13th of July, 1708, some persons had the courage to venture upon an examination of the scene of so many phenomena. The following is the account given by one of them of their adventurous enterprise:—"Having taken care to provide ourselves with a caic (kind of long boat), well caulked, and every crevice fully stopped up and secured; and having determined upon landing, if it were possible, we made direct to the island at the side where the sea was not boiling, but where it was smoking very densely. Hardly had we entered into the smoke than we felt an almost stifling heat. We put our hands into the water and found it burning, though we were still five hundred paces from our destination. There being no likelihood of our being able to advance further on that side, we turned towards the most distant point of the large crater, and at which the island had always increased in length. The fires which were visible there, and the sea which was casting out large fire-flakes, obliged us to take a great circuit; and yet we felt the heat very much. On my way I had leisure to observe the space which the new island occupied; its greatest height, seemed to be two hundred feet, its breadth about one mile, and its circumference five miles.

"After having passed more than an hour in this survey, we now felt a wish to approach the island, and once more to attempt a landing at the place which I mentioned before, as having been, for a long time, called the White Island. For several months this part had ceased to grow, and never had there been either fire or smoke perceptible. We re-embarked and rowed to that side. We were nearly two hundred paces from it, when, putting our hands into the water, we felt that the nearer we approached the hotter it became. We now sounded, and the whole line, 570 feet long, was thrown out without reaching the bottom. While deliberating whether we should proceed any further, the large mouth emitted columns of fire, with as much violence and as much noise as usual, and, to complete our ill fortune, the breeze, which was somewhat fresh, brought down upon us the cloud of ashes and smoke emitted by it; happy, however, was it for us that it brought nothing else. Ludicrous figures were we, thus covered by this shower of cinders, but none of us had much inclination to laugh; we thought only of getting away as quickly as we could; and in good time we did so, for scarcely had we got a mile and half from the island, when the bellowing and thundering began again, and a quantity of red-hot stones fell upon the very spot we had just occupied. When we landed at Santorino, our boatmen made us observe, that the great heat of the water had taken almost the whole of the pitch off our caic, which was beginning to open in every part."

During the ten succeeding years there were several eruptions of this volcano; it is now in a state of inactivity, but this pause in its energies may be only a preparation for still greater convulsions. The water is no longer hot in any part, and no exhalation is visible; but a great quantity of sulphur and bitumen is occasionally emitted from the sides, which floats upon the waters without mingling with it, and colours them differently, according to the nature and quality of the bituminous particles they carry away with them.

Similar furnaces exist in many archipelagoes. The last day of the year 1720, a new island was suddenly formed in the Strait between the island of St. Michael (the most volcanic of the Azores) and Jestrara. It was about a league in circumference; and as it were bristling with immense rocks resembling pumice-stone. Every night globes of fire and streams of fiery matter shot up like sky-rockets, to a height of three or four thousand feet. The water was very hot all around; and the sea was boiling to such a distance, that it would have been dangerous to approach the island, which rose to such a height that it was visible eight or ten leagues off. Some short time after it gave way and totally disappeared.

The island of St. Michael contains a volcanic moun-

tain, an eruption of which took place, in 1628, and produced, near the shore, in a place where there were over a hundred feet of water, a volcanic rock, a league and a half in length, which rose 360 feet above the level of the ocean; and, at the same time, it was observed with terror, that, in proportion as the new island was projected above the ocean, the summit of the volcano St. George, in the Pico or Peak-island, sank down, though there was an intervening space of more than thirty leagues between the two theatres of the explosion. This last fact would seem to confirm the conjectures of some naturalists, that there exists a sub-marine communication between volcanoes, as well in those which throw out fiery matter, as in those whence water and fire alternately issue. The explosion of these columns of water is attributed to the fall of subterranean springs upon the burning bitumen. Near Guatemala, in America, are two mountains, one of which is called a fire-volcano, and the other a water-volcano, on account of its casting up a quantity of streams. It is said of the former, that, by the light of its flames, a letter may be read at night at the distance of three miles.

These phenomena are so astonishing, that many a mind, instead of submitting its imaginations to the laws of a sound philosophy, has suffered it to wander into superstitious fancies, and little is it to be wondered at that the ignorant and the credulous should regard these appearances with superstitious terror. The Guanches, the indigenous inhabitants of Teneriffe, believed the Peak of Jeyda to be the mouth of Tartarus, and the vulgar amongst its present colonists look upon it as the entrance to hell. This celebrated Peak cannot be approached without danger. The English philosopher, Edens, who visited it in 1715, beheld running down its black sides, numerous streams of sulphureous fire, forming a thousand winding paths; in other places the soil itself is burning, or slightly covering immense abysses, which, at every moment, threaten the adventurous traveller with the fate of Empedocles. From the height of its crater are visible the twenty thousand rocks forming the structure of the island, ancient pyramids of God's own construction, resembling from afar the ruins of a Palmyra or a Persepolis. From this crater issues, almost continually, either smoke or fire, the characteristic and fearful token of former and dreadful explosions.

Two celebrated travellers of modern times, Humboldt and Bonpland, visited this Peak of Jeyda, the highest volcanic mountain on the globe, rising, as it does, eleven thousand four hundred and eighty feet above the level of the sea. In the account of their expedition Humboldt tells us—"Though in the middle of summer, and under African skies, we suffered much from cold during the night. Not being provided with either tent or cloaks, we stretched ourselves upon a ledge of rocks, where we were greatly incommoded with the flame and smoke which the wind was incessantly driving towards us. We had endeavoured to make some kind of screen from the wind by sheets tied together; but they took fire, a circumstance which we did not perceive until the most part of it had been consumed by the flames. We had never before passed a night at so great an elevation; and little did I then imagine that, at the back of the Cordilleras, we should one day inhabit cities, the site of which is higher than the top of the volcano which we hoped to reach the next day. The more the temperature lowered the more the clouds gathered round the Peak; the north wind again scattering them, and the moon-beams penetrating through them, its disk appearing at times in brighter lustre from the deep, dark-blue of those, its back-ground. The appearance of the volcano gave a sublime character to this nocturnal scene. Sometimes the Peak was entirely concealed from us by the fog, sometimes it appeared in terrifying nearness, and, like an enormous pyramid, projected its shadow over the clouds beneath us."

In the morning Humboldt and Bonpland set out on

their way to the top of the Peak. What was their admiring wonder, when, seated on the brink of the volcano, they contemplated the spectacle which surrounded them! A bright clear sky over their head, —beneath them masses of vapours, perpetually driven by the wind, were rolling like the waves of the sea, till some current of air suddenly parting them, forests, villages, the port of Orotava, with its ships lying at anchor, the vines, the gardens with which the city is surrounded, appeared, as if by some magic, through the wide chasms, and spread out before them into the far distance, so that from the top of these desert regions our two travellers might gaze upon the inhabited world, and expatiate in thought over the wide field of science, or soar from the sublime contemplation, of nature to the still more sublime conception of which man alone has been made capable—the adoring contemplation of the God of nature.

Though the Peak of Jeyda gives such perpetual indication of being a burning mountain, there has been no actual eruption since 1304, at which period the fine port of Ganachica, overwhelmed by burning lava, was utterly destroyed.

Temporary volcanic eruptions take place from time to time in different countries of the globe. In 1584, about half a league from the town of Aigle, in the Canton of Berne, a vast mass of earth issued suddenly from between two rocks, thrown out by pent-up exhalations which were struggling to escape. This phenomenon had been preceded by a great earthquake, lasting from ten to twelve minutes, and repeated for three days consecutively. This mass of earth was precipitated in a few moments over the subjacent valleys and neighbouring country. A whole hamlet was first swallowed up, with the exception of only one house; and the earth increasing as it rolled along like a snow-ball, buried, in a village below the hamlet which has just been mentioned, sixty-nine houses, one hundred and six barns, more than one hundred persons, and a quantity of cattle. This explosion of earth, accompanied by a shower of stones, and by a cloud mixed with sparks and smoke, with the disengagement of sulphurous vapours, occupied about a league in length, and in breadth about twelve acres. It was doubtless to the effort to find vent of the volcanic fire, that the earthquake which took place the few previous days is attributable.

These convulsions of nature present sometimes strange phenomena. In 1660, an earthquake was felt at Bordeaux and Narbonne, in which a mountain at Bigorre disappeared, and a lake was found in its place. An occurrence of a similar nature took place in France in 1821. On the 15th of June, about ten o'clock in the morning, a dreadful noise was heard for more than five or six minutes, in the environs of Aubenas, and was audible at more than six leagues round. They know not how to account for it, when at the same instant a very high mountain called "Gerbier de Jone," at the foot of which the Loire takes its rise, gradually sank, disappeared, and in its room was a lake. This mountain was so high, that the ascent was most difficult to the top, which terminated in a point, and at the extremity of which was a fountain. The convulsion was so great that its shock was felt five leagues round.

As remarkable a fact is told of the time of Pliny. "The last year of the reign of Nero, in the territory of Marus," says the learned naturalist, "a plantation of olives belonging to Vectius Marcellus, the Roman knight, was transported to the opposite side of the public road."

In 1665, after dreadful shocks in Canada, an extent of rocks of a hundred leagues was levelled, presenting to the eye only a flat plain.

The raging sea has also been known to burst with irresistible force its bounds, and to hurl vessels into the very midst of the forests. This has happened several times, particularly in earthquakes taking place in Mexico. In a hurricane at Guadaloupe, on the ninth of September, 1738, a ship, of eight thousand quintals

burden, anchored in a road, was carried more than five thousand feet inland.

Professor Jameson gives the following distribution of one hundred and ninety-three volcanoes in a state of activity :—

Continent of Europe	1
European Islands	12
Continent of Asia	8
Asiatic Isles	58
African Isles	8
Continent of America	87
American Isles	19

193

To these we may add the

Crater of Kiranea, in Hawarah, one of the Sandwich Isles.

Volcano of Joribora, island of Sumbawa.

" Joffa, Friendly Isles.

" Barren Island, one of the Andamans, in Bay of Bengal,

and the submarine volcanoes Nyc, off the coast of Iceland; Sabrena, off St. Michael's, and Graham's Island, not far from the east coast of Sicily.

FRANK FAIRLEIGH;

OR,

SCENES FROM THE LIFE OF A PRIVATE PUPIL.

CHAP. IX.

THE morning was beautiful; it was one of those enjoyable days, which sometimes occur in early spring, and in which nature, seeming to overleap at a bound the barrier between winter and summer, gives us a delightful foretaste of the good things she has in store for us. The clear bright sea, its surface just ruffled by a slight breeze from the south-west, sparkled in the sunshine, and fell in diamond showers from our oars, as we raised them out of the water, while the calm serenity of the deep blue sky above us, appeared indeed a fitting emblem of that heaven, in which "the wicked cease from troubling, and the weary are at rest."

The peaceful beauty of the scene seemed to impress even the restless spirits of which our little party was composed, and, by common consent, we ceased rowing, and suffered the boat to drift with the tide, merely pulling a stroke now and then to keep her head in the right direction. After floating for some twenty minutes or so in the manner I have described, Lawless, who never could remain quiet long, dropped the blade of his oar into the water with a splash that made us all start, exclaiming as he did so, "Well, this may be very sentimental and romantic, and all that sort of thing, but it doesn't strike me as particularly entertaining. Why, you fellows were all asleep, I believe." "Heigho!" exclaimed Oaklands, rousing himself, with a deep sigh, "I was in such a delicious reverie; what a barbarian you are, Lawless; you seem utterly ignorant of the pleasures of the *dolce-far-niente*." "*Dolce-far-devilskin*!" was the reply, in tones of the greatest contempt. "I would not be as lazy as you are, Oaklands, for any money. You are fitter to lounge about in some old woman's drawing-room, than to handle an oar." "Well, I don't know," answered Oaklands, quietly, "but I think I can row as long as you can." "You do, do you?" rejoined Lawless, "it will be odd to me, if you can. I don't think I was stroke-oar in the crack boat at Eton for a year, without knowing how to row a little; what do you say to having a try at once?" "With all my heart," replied Oaklands, divesting himself of his waistcoat, braces, and neckcloth, —which latter article he braced tightly round his waist —an example speedily followed by Lawless. "Now,

you young shavers, pull in your oars, and we'll give you a ride, all free, gratis, for nothing." Mullens and I hastened to comply with Lawless's directions, placing the oars and seating ourselves so as not to interfere with the trim of the boat; while he and Oaklands, each taking a firm grasp of his oar, commenced pulling away in real earnest. They were more evenly matched than may be at first imagined, for Lawless, though much shorter than Oaklands, was very square built, and broad about the shoulders, and his arms, which were unusually long in proportion to his height, presented a remarkable development of muscle, while it was evident from the manner in which he handled his oar, that he was the more practised rower of the two. The boat, urged by their powerful strokes, appeared to fly through the water, while cliff and headland (we were rowing along shore about half a mile from the beach) came in view and disappeared again like scenes in some moving panorama. We must now have proceeded some miles, yet still the rival champions continued their exertions with unabated energy, and a degree of strength that seemed inexhaustible. Greatly interested in the event, I had at first watched the contending parties with anxious attention, but, perceiving that the efforts they were making did not produce any visible effects upon them, and that the struggle was likely to be a protracted one, I took advantage of the opportunity to open a letter from my sister, which I had received just as I was leaving the house. I was sorry to find, on perusing it, that my father had been suffering from an inflammatory attack, brought on by a cold which he had caught in returning from a visit to a sick parishioner, through a pouring rain. A postscript from my mother, however, added, that I need not make myself in the least uneasy, as the apothecary assured her that my father was going on as well as possible, and would probably be quite restored in the course of a week or so. On observing the date of the letter, I found I ought to have received it the day before. Arguing from this (on the "no-news being good-news" system) that I should have heard again if anything had gone wrong, I dismissed the subject from my mind, and was reading Fanny's account of a juvenile party she had been at in the neighbourhood, when my attention was roused by Coleman, who laying his hand on my shoulder said—"Look out, Frank, it won't be long now before we shall see who's best man; the work's beginning to tell." Thus invoked, I raised my eyes, and perceived that a change had come over the aspect of affairs, while I had been engaged with my letter. Oaklands and Lawless were still rowing with the greatest perseverance, but it appeared to me that their strokes were drawn with less and less vigour each succeeding time, while their flushed faces, and heavy breathing, proved that the severe labour they had undergone had not been without its effect. The only visible difference between them was that Lawless, from his superior training, had not, as a jockey would say, "turned a hair," while the perspiration hung in big drops upon the brow of Oaklands, and the knotted, swollen veins of his hands stood out like tightly strained cordage. "Hold hard," shouted Lawless. "I say, Harry," he continued, as soon as they had left off rowing, "how are you getting on?" "I have been cooler in my life," replied Oaklands, wiping his face with his handkerchief. "Well, I think it's about a drawn battle," said Lawless, "though I am free to confess, that if you were in proper training, I should be no match for you, even with the oar." "What made you stop, just then?" inquired Oaklands, "I'm sure I could have kept on for a quarter of an hour longer, if not more." "So could I," replied Lawless, "ay, or for half an hour, if I had been put to it; but I felt the work was beginning to tell, I saw you were getting used up, and I recollected that we should have to row back with the wind against us, which, as the breeze is freshening, will be no such easy matter; so I thought if we went on, till we were both done up, we should be in a regular fix." "It's lucky you remem-

bered it," said Oaklands; "I was so excited, I should have gone on pulling as long as I could have held an oar; we must be some distance from Helmstone by this time. Have you any idea whereabouts we are?" "Let's have a look," rejoined Lawless. "Yes, that tall cliff you see there is the Nag's Head, and in the little bay beyond stands the village of Fisherton. I vote we go ashore there, have some bread and cheese, and a draught of porter at the inn, and then we shall be able to pull back again twice as well."

This proposal seemed to afford general satisfaction; Mullins and I resumed our oars, and, in less than half an hour, we were safely ensconced in the sanded parlour of the "Dolphin," while the pretty bar-maid, upon whom also devolved the duties of waitress, hastened to place before us a smoking dish of eggs and bacon, which we had chosen in preference to red herrings,—the only other dainty the Dolphin had to offer us,—Coleman observing, that "a hard roe" was the only part of a herring worth eating, and we had had that already, as we came along. "I say, my love, have you got any bottled porter?" enquired Lawless. "Yes, sir, and very good it is," replied the smiling damsel. "That's a blessing," observed Coleman, piously. "Bring us up a lot of it, there's a dear," resumed Lawless; "and some pewter pots—porter's twice as good out of its own native pewter." Thus exhorted, the blooming waitress tripped off, and soon returned with a basket containing six bottles of porter. "That's the time of day," said Lawless; "now for a cork-screw, pretty one; here you are, Oaklands." "I must own that is capital, after such hard work as we have been doing," observed Oaklands, as he emptied the pewter pot at a draught. "I say, Mary," asked Coleman, "what's gone of that young man, that used to keep company along with you,—that nice young chap, that had such insinivatin ways with him?" "I'm sure I don't know what you're talking about, sir; I've nothink to say to no young man whatsumever," replied the damsel addressed, shaking her curls coquettishly. "Ah!" sighed Coleman, "if I were but single now." "Why, you never mean to say you've got a wife already, such a very young gentleman as you are?" "Not only that, but three little pledges of connubial felicity, and a fourth expected next week, if it isn't twins," continued Coleman, pathetically. "Well, I never!" exclaimed the bar-maid, surprised, for once, out of her company manners; then, observing a smile, at her expense, going the round of the party, she added, "I see how it is; you are making fun of me, sir; oh, fye, you're a wicked young gentleman, I know you are." "Never mind him, my dear," said Lawless, "but give me another bottle of porter." In converse such as this, the meal, and the half dozen of porter were finished; in addition to which, Lawless chose to have a glass of brandy-and-water and a cigar. Having been rendered unusually hungry by the sea air and the unaccustomed exercise of rowing, I had both eaten and drunk more than I was in the habit of doing, to which cause may be attributed my falling into a doze; an example which, I have every reason to believe, was followed by most of the others. I know not how long my nap had lasted, when I was aroused by hearing Coleman exclaim, "Why, I think it rains! Lawless, wake up! I don't much like the look of the weather." "What's the row?" enquired Lawless, leisurely removing his legs from the table on which they had been resting, and walking to the window, a feat, by the way, he did not perform quite as steadily as usual. "By Jove!" he continued, "the wind's blowing great guns; we must look sharp, and be off—we shall have the sea getting up." Accordingly, the bill was rung for, and paid; Mary received half-a-crown and a kiss, and down we ran to the beach, where difficulties we were little prepared for awaited us.

The wind, which we had observed was rising when we landed, had increased during our stay at the inn, and was now blowing almost a gale from the south-west; whilst the sea, which we had left smooth as a lake, was rolling in, and breaking on the beach, in somewhat

formidable waves. "I tell you what," said Coleman, as soon as he had observed the state of affairs, "I won't attempt to steer in such a sea as that; it requires great skill and judgment, besides a stronger hand than mine, to keep the boat's head right; if I were to let her turn her broadside to one of those waves, it would be a case of 'Found drowned,' with some of us, before long." "What's to be done, then?" enquired Oaklands. "I am sure I can't do it, it's a thing I'm quite ignorant of; all my boating having been on the river." "Let's hire one of those amphibious beggars out there, to steer for us," proposed Lawless, pointing to a group of fishermen who were lounging round an old boat, not far from where we stood, "they're up to all the right dodges, you may depend. Here, my men! which of you will earn half-a-guinea, by steering our boat for us to Helmstone?" "I wouldn't, master, for ten times the money," replied an old weather-beaten boatman, in a tarpaulin hat; "and if you'll take an old man's advice, gentlemen, you'll none of you venture out in that cockle-shell this afternoon; the wind's getting up every minute, and we shall have a rough night of it." "Nonsense," replied Lawless; "I've often been out in worse weather than this. Are you, all of you, frightened by that old woman's croaking?" continued he, turning to the group of men. "He's no old woman," replied a sturdy fellow, in a rough pea-jacket; "he's been a better sailor than ever you'll be, and he's right now too," he added. "It's as much as a man's life is worth to go to sea in that bit of a thing, with the waves running in as they do now,—and with such a set of landlubbers as them for a crew," he muttered, turning away. "Suppose we try and get something to take us home by land," suggested Oaklands; "and leave the boat for some of these good fellows to bring home, as soon as the weather will allow." "You'll have to walk, sir," replied one of them, civilly; "I don't believe there's a cart or horse in the place; they all went inland this morning, with fish, and won't return till to-morrow." "There, you hear that," said Lawless, who had just drunk enough to render him captious and obstinate. "I'm not going to walk to please anybody's fancy; I see how it is,—I did not bid high enough. A couple of guineas for any one who will come with us," added he. "A couple of guineas is not to be got every day," observed a disagreeable looking man, who had not yet spoken; "and it is not much odds to me, whether I sink or swim now; those custom-house sharks," added he, with an oath, "look so close after one, that one can't do a stroke of work that will pay a fellow now-a-days. Money down, and I'm your man, sir," he added, turning to Lawless. "That's the ticket," said Lawless, handing him the money. "I'm glad to see one of you, at least, has got a little pluck about him. Come along." I could see that Oaklands did not at all approve of the plan, evidently considering we were running a foolish risk; but, as nothing short of a direct quarrel with Lawless could have prevented it, his habitual indolence and easy temper prevailed, and he remained silent. I felt much inclined to object, in which case, I had little doubt the majority of the party would have supported me; but a boyish dread, lest my refusal should be attributed to cowardice, prevented my doing so. With the assistance of the bystanders, we contrived to launch our little bark, without further misadventure than a rather heavier sprinkling of salt-water than was agreeable. Rowing in such a sea, however, proved much harder work than I, for one, had any idea of; we made scarcely any way against the waves, and I soon felt sure that it would be utterly impossible for us to reach Helmstone by any exertions we were capable of making. The weather too was getting worse every minute; it rained heavily, and it was with the greatest difficulty we were able to prevent the crests of some of the larger waves from dashing into our boat; in fact, as it was, she was already half full of water, which poured in faster than Coleman (who was the only person not otherwise engaged) could bale it out. "Upon my word, Lawless, it's madness to attempt to go on,"

exclaimed Oaklands; "we are throwing away our lives for nothing." "It certainly looks rather queerish," replied Lawless. "What do you say about it, my man?" he asked of the person whom he had engaged to steer us. "I say," replied the fellow, in a surly tone, "that our only chance is to make for the beach at once, and we shall have better luck than we deserve, if we reach it alive." As he spoke, a larger wave than usual broke against the bow of the boat, flinging in such a body of water, that we felt her stagger under it, and I believed, for a moment, that we were about to sink. This decided the question; the boat's head was put about, with some difficulty, and we were soon straining every nerve to reach the shore. As we neared the beach, we perceived that, even during the short time which had elapsed since we quitted it, the sea had become considerably rougher, and the line of surf now presented anything but an encouraging appearance. As we approached the breakers, the steersman desired us to back with our oars, till he saw a favourable opportunity; and the moment he gave us the signal, to pull in as hard as we were able. After a short pause the signal was given, and we attempted to pull in as he had directed; but, in doing this, we did not act exactly in concert—Lawless taking his stroke too soon, while Mullins did not make his soon enough; consequently we missed the precise moment, the boat turned broadside to the beach, a wave poured over us, and in another instant we were struggling in the water. For my own part, I succeeded in gaining my legs, only to be thrown off them again by the next wave, which hurried me along with it, and flung me on the shingle, when one of the group of fishermen who had witnessed the catastrophe, ran in, and seizing me by the arm, in time to prevent my being washed back again by the under-tow, dragged me out of the reach of the waves.

On recovering my feet, my first impulse was to look round for my companions; I at once perceived Lawless, Mullins, and Oaklands, who were apparently uninjured, though the latter held his hand pressed against his forehead, as if in pain; but Coleman was nowhere to be seen. "Where is Coleman?" exclaimed I. "There is some one clinging to the boat, still," observed a bystander. I looked anxiously in the direction indicated, and perceived the boat floating bottom upwards, just beyond the line of breakers; while, clinging to the keel, was a figure which I instantly recognised to be that of Coleman. "Oh, save him, save him, he will be drowned," cried I, in an agony of fear. "Ten guineas for any one who will get him out," shouted Lawless; but nobody seemed inclined to stir. "Give me a rope," cried I, seizing the end of a coil which one of the boatmen had over his shoulder, and tying it round my waist. "What are you going to do?" asked Lawless. While he spoke a large wave separated Coleman from the boat, and as it poured its huge volume upon the beach, bore him along with it. With the swiftness of thought I sprang forward, and succeeded in throwing my arms round him, ere the next advancing wave dashed over us. And now my foresight in fastening the rope around me, proved, under Providence, the means of saving both our lives. Though thrown to the ground by the force of the water, I contrived to retain my grasp of Coleman, and we were hauled up, and conveyed beyond the reach of the surf, by the strong arms of those on shore, ere another wave could approach to claim its victims.

On recovering my consciousness, (I had been partially stunned by the violence of my last fall,) I found myself lying on the beach, with my head resting on the breast of Oaklands. "My dear, dear Frank, thank God that you are safe!" exclaimed he, pressing me more closely to him. "What of Coleman?" asked I, endeavouring to raise myself. "They are taking him to the inn," was the reply; "I will go and see if I can be of any use, now I know you are unhurt; but I could not leave you till I felt sure of that." "I fancied you seemed in pain just now," said I. "I struck my head against some part of the boat when she capsized," returned Oaklands, "and

the blow stunned me for a minute or two, so that I knew nothing of what was going on till I saw you rush into the water to save Coleman; that roused me effectually, and I helped them to pull you both out. Frank, you have saved his life." "If it is saved," rejoined I; "let us go and see how he is getting on; I think I can walk now, if you will let me lean upon your arm." With the assistance of Oaklands, I contrived to reach the inn without difficulty; indeed, by the time I got there (the walk having served in great measure to restore my circulation), I scarcely felt any ill effects from my late exertions. The inn presented a rare scene of confusion; people were hurrying in and out, the messenger sent for the doctor had just returned, breathless, to say he was not to be found,—the fat landlady, in a state of the greatest excitement, was going about making impracticable suggestions, to which no one paid the slightest attention, while Coleman, still insensible, was lying wrapped in blankets before a blazing fire in the parlour, with the pretty bar-maid sobbing piteously on her knees beside him, as she chafed his temples with some strong essence. "That's the time of day!" exclaimed Lawless, as his eye fell upon a printed card which the landlady had just thrust into his hand, headed, "The directions of the Humane Society for the restoration of persons apparently drowned." "We shall have it now, all right," added he, and then read as follows:—"The first observation we must make, which is most important, is, that rolling the body on a tub"—"Bring a tub," cried the landlady, eagerly, and off started several of the bystanders to follow her injunctions—"is most injurious," continued Lawless, "but holding up by the legs with the head downwards"—(a party of volunteers, commanded by the landlady, rushed forward to obtain possession of Coleman's legs) "is certain death," shouted Lawless, concluding the sentence. While this was going on, I had been rubbing Coleman's hands between my own, in the hope of restoring circulation; and now, to my extreme delight, I perceived a slight pulsation at the wrist; next came a deep sigh, followed by a tremulous motion of the limbs; and, before five minutes were over, he was sufficiently restored to sit up, and recognise those about him. After this his recovery progressed with such rapidity, that ere half an hour had elapsed, he was able to listen with interest to Oaklands's account of the circumstances attending his rescue, when Lawless, hastily entering the room, exclaimed—"Here's a piece of good luck, at all events; there's a post-chaise just stopped, returning to Helmstone, and the boy agrees to take us all for a shilling a head, as soon as he has done watering his horses; how is Freddy getting on?—will he be able to go?" "All right, old fellow," replied Coleman. "Thanks to Fairleigh in the first instance, and a stiff glass of brandy and water in the second, Richard's himself again!" "Well, you've had a near shave for it, this time, however," said Lawless; "there is more truth than I was aware of in the old proverb, 'If you are born to be hanged, you will never be drowned;' though, if it had not been for Frank Fairleigh, you would not have lived to fulfil your destiny." In another ten minutes we were all packed in and about the post-chaise; Coleman, Oaklands, and myself occupying the interior, while Lawless and Mullins rode outside. The promise of an extra half-crown induced the driver to use his best speed. At a quarter before five we were within a stone's throw of home, and if that day at dinner Mrs. Mildman observed the pale looks and jaded appearance of some of the party, I have every reason to believe she has remained up to the present hour in total ignorance as to their cause.

As I was undressing that night, Coleman came into my room, and grasping my hand with his own, shook it warmly, saying, "I could not go to sleep, Frank, without coming to thank you for the noble way in which you risked your own life to save mine to-day. I laughed it off before Lawless and the rest of the fellows, for when I feel deeply, I hate to show it; but indeed,

(and the tears stood in his eyes while he spoke,) indeed I am not ungrateful." "My dear Freddy," returned I, "do not suppose I thought you so for a moment; there, say no more about it; you would have done the same thing for me that I did for you, had our positions been reversed." "I am not so sure of that," was his reply, "I should have wished to do so; but it is not every one who can act with such promptitude and decision in moments of danger." "There is one request I should like to make," said I. "What is it?" replied he, quickly. "Do not forget to thank Him, whose instrument I was, for having so mercifully preserved your life." A silent pressure of the hand was the only answer, and we parted for the night.

Owing, probably, to over-fatigue, it was some little time before I went to sleep. As I lay courting the fickle goddess (or god as the case may be, for mythologically speaking, I believe Somnus was a *he*), I could not help contrasting my present feelings with those which I experienced on the first night of my arrival. Then, overcome by the novelty of my situation, filled with a lively dread of my tutor, bullied and despised by my companions, and separated for what I deemed an interminable period from all who were dear to me, my position was far from an enviable one. Now, how different was the aspect of affairs! With my tutor, who, from an object of dread, had become one of esteem and affection, I had every reason to believe myself a favourite; I was on terms of the closest friendship with those of my companions whose intimacy was best worth cultivating; while with the others I had gained a standing which would effectually prevent their ever venturing seriously to annoy me; and, above all, I had acquired that degree of self-confidence, without which one is alike impotent to choose the good or to refuse the evil. And it was with an honest pride that I reflected, that this improvement in my position was mainly owing to a steady adherence to those principles, which it had been the constant aim of my dear parents to instill into me from my childhood. I fell asleep at last, endeavouring to picture to myself the delights of relating my adventures on my return home, how my mother and sister would shudder over the dangers I had escaped, while my father would applaud the spirit which had carried me through them. The vision was a bright and happy one; would it ever be realized?

To our surprise, we learned the next morning, that Dr. Mildman had arrived by the last coach the previous evening, having fortunately met with Cumberland's uncle at his house of business in town, and delivered his nephew into his safe custody without further loss of time. The breakfast passed over without the doctor making any inquiry how we had amused ourselves during his absence, nor, as may easily be believed, did we volunteer any information on the subject. On returning to the pupils' room, I found a letter, in my sister's hand-writing, lying on the table. With a feeling of dread, for which I could not account, I hastened to peruse it. Alas! the contents only served to realize my worst apprehensions. My father's illness had suddenly assumed a most alarming character, inflammation having attacked the lungs with so much violence, that the most active measures had failed to subdue it, and the physician, whom my mother had summoned on the first appearance of danger, scarcely held out the slightest hope of his recovery. My mother wished me to return home without any loss of time, as my father, before he became delirious, had desired that I might be sent for, expressing himself most anxious to see me; and the letter concluded with a line in my mother's hand-writing, exhorting me to make every exertion to reach home without delay, if I wished to see him alive. For a minute or two, I sat with the letter still open in my hand, as if stunned by the intelligence I had received; then, recollecting that every minute was of importance, I sprang up, saying, "Where's Dr. Mildman? I must see him directly." "My dear

Frank, is anything the matter? you are not ill?" inquired Oaklands, anxiously. "You have received some bad news, I am afraid," said Coleman.

"My father is very ill, dying perhaps," replied I, while the tears which I in vain endeavoured to restrain, trickled down my cheeks. After giving way to my feelings for a minute or two, the necessity for action again flashed across me. "What time is it now?" inquired I, drying my eyes. "Just ten," replied Oaklands, looking at his watch. "There is a coach which starts at the half hour, is there not?" "Yes, the Highflyer, the best drag on the road," returned Lawless; "takes you to town in five hours, and does the thing well, too."—"I must go by that, then," replied I. "What can I do to help you?" asked Coleman. "If you would put a few things into my bag for me, while I speak to the Doctor," rejoined I. "I will go and get a fly for you," said Lawless, "and then I can pick out a nag that will move his pins a bit; that will save you ten minutes, and you have no time to lose." On acquainting Dr. Mildman with the sad intelligence I had received, and the necessity which existed for me to depart immediately, he at once gave me his permission to do so; and, after speaking kindly to me, and showing the deepest sympathy for my distress, he said he would not detain me longer, as I must have preparations to make, but should like to see me the last thing before I started, and wish me good bye.

I found, on reaching my own room, that all was quite ready: Coleman and Thomas (whose honest face wore an expression of genuine commiseration) having exerted themselves to save me all trouble on that head. Nothing, therefore, remained for me to do, but to take leave of my fellow-pupils and Dr. Mildman. After shaking hands with Lawless and Mullins, (the former assuring me, as he did so, that I was certain not to be late, for he had succeeded in securing a trap, with a very spicy little nag in it, which would have me there in no time,) I hastened to take leave of my tutor. After inquiring whether I had sufficient money for my journey, and begging me to write him word how I got home, he shook me kindly by the hand, saying, as he did so, "God bless you, my boy! I trust you may find your father better; but if this should not be the case, remember whose hand it is inflicts the blow, and strive to say, 'Thy will be done.' We shall have you among us again soon, I hope; but should any thing prevent your return, I wish you to know, that I am perfectly satisfied with the progress you have made in your studies; and, in other respects, you have never given me a moment's uneasiness since you first entered my house. Once more, good bye; and remember, if ever you should want a friend, you will find one in Samuel Mildman."

The fly-horse proved itself deserving of Lawless's panegyric, and I arrived at the coach-office in time to secure a comfortable seat outside the Highflyer. After taking an affectionate leave of Oaklands and Coleman, who had accompanied me, I ascended to my place; the coachman mounted his box exactly as the clock chimed the half-hour, the horses sprang forward with a bound, and ere ten minutes had elapsed, Helmstonc lay at least a couple of miles behind us.

I accomplished my journey more quickly than I had deemed possible, and had the melancholy satisfaction of reaching home in time to receive my father's blessing. The powerful remedies to which they had been obliged to have recourse, had produced their effect; the inflammation was subdued; but the struggle had been protracted too long, and his constitution, already enfeebled by a life of constant labour and self-devotion, was unable to rally. Having given me a solemn charge to cherish and protect my mother and sister, he commended us all to the care of Him, who is so emphatically termed "the God of the fatherless and widow;" and then, his only earthly care being ended, he prepared to meet Death, as those alone can do to whom "to die is gain." When the

last beam of the setting sun threw a golden tint around the spire of the little village church, those lips which had so often breathed the words of prayer and praise within its sacred walls were mute for ever, and the gentle spirit which animated them had returned to God who gave it!

But little more remains to be told. My father's income being chiefly derived from his church preferment, and his charities having been conducted upon too liberal a scale to allow of his laying by money, the funds which remained at my mother's disposal after winding up his affairs, though enough to secure us from actual poverty, were not sufficient to allow of my continuing an inmate of an establishment so expensive as that of Dr. Mildman. On being informed of this change of circumstances, the Doctor wrote to my mother, in the kindest manner; speaking of me in terms of praise which I will not repeat, and inquiring what were her future views in regard to me; expressing his earnest desire to assist them to the utmost of his ability. At the same time I received letters from Oaklands and Coleman, full of lamentations that I was not likely to return; and promising, in the warmth of their hearts, that their fathers should assist me in all ways, possible and impossible. Mr. Coleman, senior, in particular, was to do most unheard-of things for me; indeed, Freddy more than hinted, that through his agency, I might consider myself secure of the Attorney Generalship, with the speedy prospect of becoming Chancellor. I also found enclosed a very characteristic note from Lawless; wherein he stated, that if I really was likely to be obliged to earn my own living, he could put me up to a dodge, by which all the disagreeables of having so to do might be avoided. This infallible recipe proved to be a scheme for my turning stage coachman! After citing numerous examples of gentlemen who had done so, (amongst whom the name of a certain baronet stood forth in high pre-eminence,) he wound up by desiring me to give the scheme my serious attention, and, if I agreed to it, to come and spend a month with him when he returned home at Midsummer; by the end of which time he would engage to turn me out as finished a "Waggoner" as ever handled the ribbons. To these letters I despatched suitable replies; thanking the writers for their kindness, but refusing to avail myself of their offers, at all events for the present; and I finished by expressing a hope, that be my fate in life what it might, I should still preserve the regard and esteem of the friends whose affection I prized so highly.

Reader, the "Scenes from the Life of a Private Pupil" are ended. To the writer of these recollections of his boyhood—that happy time in which sorrows and annoyances, however sharply they may be felt for the moment, are as quickly forgotten, while pleasure is enjoyed with a zest our manhood seeks in vain—when life and hope are strong within us, and, as yet untaught by sad experience, we love with full and trusting hearts,—the task of recording these various scenes has been a pleasant one.

Whether the reader will regard his share of the trouble in the same favourable light remains to be proved. It remains for him also to determine, whether the "Private Pupil" has excited his interest sufficiently to make him desirous of learning aught of the after life and adventures of "Frank Fairleigh."

THE ELOPEMENT.¹

(From the German of Musæus.)

ON the small piece of water, named Luckwitz, in Vogtland, which lies on the borders of Thuringia, is situated the Castle of Lauenstein, which was formerly an abode of nuns, who were dispersed in the wars against the Hussites. The domains were in the

course of time given over to a lay possessor as a forfeited fief, and were let by the Count of Orlamund, the proprietor of the land, to a tenant, who built himself a castle from the ruins of the cloister, and either gave his name to, or received it from, the well-earned possessions, and was called the Squire of Hallermund. But he soon learnt that ecclesiastical wealth does not prosper in the hands of the laity; and that even a peaceable robbery of the church will be revenged in one way or another. The bones of the holy nuns, which had already reposed in perfect peace for centuries in the dark vaults of the grave, could not with indifference submit to the desecration of their sanctuary. Once in every seven years did some one of them, rising from her tomb, march around the court-yard, parade through the chambers, open and shut doors, and create a fearful noise and clashing in the church porch, which still remained uninjured. In time the inhabitants became accustomed to the appearance of the ghost, and when the period came for the apparition, the domestics avoided entering the church porch, or quitting their chambers by night.

At the decease of the first possessor, the estate fell to his descendants by lawful wedlock; and there never was a male heir wanting till the time of the Thirty Years' War, at which time bloomed the last shoot of the race of Lauenstein. Squire Sigismund was, for the time in which he lived, a very excellent man, who lived on his lands with a good reputation, did not squander the inheritance which he derived from his frugal fathers, but enjoyed by its aid the pleasures of life. He had (as soon as his predecessor vacated his place for him, and left him the possession of Lauenstein) married according to the custom of his race, and became the happy parent of a fine girl.

Mademoiselle Emily, amid the multiplicity of domestic affairs, was in a great measure left to the cares of trusty mother Nature, and did not lose by this. The invisible artist, who does not willingly endanger her reputation, and usually atones by some *chef d'œuvre* for any mistake which may be attributable to her, had granted to the daughter a more liberal proportion of intellect and of personal charms than to the father; she was pretty, and had good sense. In time, when the charms of the young lady began to bloom, her mother's views were directed to elevating high, through her, the splendour of the nearly extinct family. The lady possessed a secret pride, which did not evince itself in the common affairs of life, unless in her value for their genealogic tree, which she considered as the most honourable decoration of the house. In the whole extent of Vogtland, with the exception of the Russian nobles, she saw no family so rich and noble as that she should desire to see the last blossom of the root of Lauenstein transplanted into it; and, however anxious the young lords in the neighbourhood might be to obtain the lovely prize, the mother had sufficient art to frustrate their designs. She watched the heart of the maiden as carefully as the toll-gatherer watches the turnpike gate, that no contraband goods may pass through; rejected all the well-intentioned speculations of cousins and aunts, who were intent on match-making, and, with mademoiselle, her daughter, carried herself so high that no youth ventured to approach. As long as the heart of a maiden is yet to be moulded, it resembles a boat on a mirrored lake, which readily obeys the steersman, but when the wind rises, and the waves rock, the light skiff is no longer

(1) See Engraving, page 129.

obedient to the helm, but yields to the guidance of winds and waves. The tractable Emily willingly allowed her mother to conduct her in leading-strings on the path of pride; her yet untouched heart was capable of any impression. She awaited some prince or count to worship her charms; and rejected with cold reserve all less high-born paladins who made their court to her. Meanwhile, ere a suitable worshipper presented himself before the Grace of Lauenberg, a circumstance happened, which decidedly frustrated her mother's plans of marriage, and through which all princes and counts of the Roman-catholic German nation would have come too late to strive for the heart of the maiden.

In the troubles of the thirty years' war the army of the brave Wallenstein took up its winter quarters in the neighbourhood of Vogtland. Squire Sigismund received many unbidden guests, who created more confusion in the castle than the ghostly wanderers had formerly done. Although they, indeed, asserted not the rights of possession, like their predecessors, yet they were not to be driven away by any exorcists. The lord of the manor was compelled to play this losing game cheerfully; and, in order to preserve the domineering gentlemen in good humour, and keep them in good order, they were entertained most sumptuously. Banquets and balls succeeded each other without intermission: at the former the lady of the house presided, at the latter mademoiselle. This splendid manner of exercising the rights of hospitality rendered the rude warriors quite complaisant; they honoured the house where they were so well fed; and landlord and guests were mutually content. Among these heroes were many who might have won the heart of the goddess of beauty herself; but one surpassed all others. A young officer, named the handsome Fritz, had the appearance of an armed Cupid, he united with a handsome form a very pleasing deportment, was mild, modest, and agreeable, besides possessing much intellect, and being a very nimble dancer. No man had hitherto made an impression on the heart of Emily; but this youth roused in her maidenly bosom an unknown feeling, which filled her soul with an indescribable emotion. The only thing which surprised her was that the charming Adonis was not called the handsome prince or the handsome count, but merely the handsome Fritz. She occasionally inquired of one or other of his companions in war, on their more intimate acquaintance, the family name of the young man, and his descent; but nobody could enlighten her on the subject. All praised the beautiful Fritz as a brave man, who understood the service, and possessed the most amiable character. However, it did not appear that his genealogy was very clearly to be traced; there were as many versions of it as of the descent and the true position in society of the well-known, and yet mysterious, Count Cagliostro, who was sometimes reputed the offspring of a grand master of Malta, being also his nephew, on the mother's side; sometimes the son of a Neapolitan coachman; sometimes the brother of Zannovich, the pretended prince of Albania; and sometimes had assigned to him, as a calling, the office of perriwig-maker. However, all the conjectures were unanimous in asserting that the handsome Fritz had risen from the ranks to be a captain of horse; and that if fortune yet favoured him, he would advance with hasty steps to the most distinguished posts in the army.

The secret inquiries of the curious Emily were not concealed from him; his friends imagined that they should flatter him with this news, and accompanied it with much pleasing encouragement. He modestly interpreted their surmises as raillery and jest; but in his heart he was glad to learn that the young lady had sought information respecting him, for even the first glance at her had filled him with the ardour which is usually the precursor of love. No language possesses such energy, or is so easily understood, as the feeling of sweet sympathy, by aid of which the progress from first

acquaintance to love usually proceeds, more quickly than from the ranks to command as captain. They did not, it is true, so soon make an open declaration; but both parties knew how to impart their feelings to the other, and they mutually understood each other, their glances met half way, and told what coy love ventures to disclose. The negligent mamma had just, at a wrong time, in consequence of the prevailing confusion, withdrawn the guard from the portals of her daughter's heart; and as soon as this important post was unguarded, the cunning smuggler, Cupid, watched his opportunity to steal in thither unobserved, by twilight. When once he had charge of the affair he gave to the maiden very different counsels from her mamma. He, an acknowledged enemy to all ceremony, from the first robbed the young lady of the prejudice, that birth and rank must be considered in the sweetest of passions, and that lovers must be of corresponding antiquity of birth; thus classing themselves, like the beetles and reptiles in a collection of dead insects. The freezing pride of ancestry melted in her heart, like the fantastical flower-patterns on a frosty pane of glass, when the beams of the delightful sun warmed the atmosphere. Emily abandoned her beloved ancestral-tree, and letters of nobility; and carried her heretical opinion so far, that she nourished the belief that the privileges of birth were, as regards love, the most intolerable yoke which the freedom of man had ever submitted to.

The handsome Fritz adored the maiden; and as he discovered from every incident that fortune favoured him as much in love as in war, he delayed not, on the first opportunity that presented itself, to open to her, without reserve, the state of his heart. She received the avowal of his love with blushes, but not the less with inward pleasure; and their confiding hearts united themselves in the mutual vows of inviolable constancy. They were now happy for the present, and looked not forward to the future. The return of spring recalled the troops to their tents; the army assembled; and the sad moment when the lovers must be parted, now approached. Now they consulted earnestly how they might legally be united in the bonds of love, so that nothing but death could part them. The maiden had disclosed to her lover the opinions of her mother respecting marriage; and it was not to be anticipated that the proud lady would retract a hair's breadth of her beloved system, to favour a match of affection. A hundred plans were formed for overcoming this obstacle, and all were rejected; in each appeared some insurmountable obstacle which caused them to doubt its success. Meanwhile, since the young warrior found that his beloved was resolved to seize any plan which might lead to the fulfilment of her wishes, he proposed to her an elopement; the safest measure which love has ever contrived, by which he has countless times succeeded, and will still succeed, in frustrating the plans of parents, and overcoming their obstinate pride. The maiden considered for a time, and then agreed to it. Now, only one thing was to be considered, how she should escape from the well-walled and well-defended castle, to throw herself into the arms of her anxious lover; for she well knew that the watchfulness of her mother, as soon as Wallenstein's garrison had marched away, would again return to its former occupation—would watch her every step, and not let her escape from her sight. But ingenious love triumphs over every difficulty: the maiden knew that on the day of All Saints, in the following autumn, the time would come, according to tradition, for the return to the castle of the apparition of the ghost of the nun, after an interval of seven years. The fear that all the inhabitants of the castle had of this apparition was also known to her; therefore she conceived the bold idea of undertaking for this time the part of the spirit, causing a nun's habit to be secretly prepared, and escaping in this incognito. The handsome Fritz was delighted at this well-contrived plan, and clapped his hands for joy. Although, at the time

of the Thirty Years' War, it was too early in the day for disbelieving, yet the young hero was a sufficient philosopher to doubt the existence of spirits, or at least to assign to them their proper place without further speculation. After all was arranged, he leapt into his saddle, recommended himself to the protection of love, and set forth at the head of his squadron. The campaign passed favourably for him, although he exposed himself to every danger; it appeared as though Love had listened to his prayers, and taken him under his protection.

Meanwhile Mademoiselle Emily lived between hope and fear; she trembled for the life of her faithful Amadis, and industriously sought news of how it happened in the field with their winter's guests. Every report of a skirmish plunged her in grief and horror, which her mother interpreted as a proof of her kindness of heart, without nourishing the least suspicion. The warrior did not fail from time to time to send news of himself to his beloved, in secret letters, which reached her by the hand of a trusty chambermaid, and also received intelligence from her by the same medium. As soon as the campaign was ended he put everything in readiness for the approaching secret expedition, provided himself with a trusty steed, and looked eagerly in the almanack for the appointed day, when he was to repair to the trysting-place in a pleasure-grove of Lauenstein Castle, in order not to break his engagement.

On All Saints day the maiden, with the assistance of the faithful chambermaid, prepared for the execution of her design, pretended a slight indisposition, betook herself in good time to her chamber, and there transformed herself into the loveliest hobgoblin that ever appeared on earth. The tardy hours of evening lengthened themselves, according to her reckoning, beyond their proper limits, and every instant increased her desire to attempt the adventure. Meanwhile the silent friend of lovers, the pale moon, lighted with her silvery beams the Castle of Lauenberg, in which all the bustle of busy day was now hushed in a solemn stillness. No one was now awake in the castle except the housekeeper, who, yet in the late hour of night, was calculating in difficult figures the kitchen expenses; the chicken-plucker, who had to pick thirty larks for the squire's breakfast; the doorkeeper, who at the same time performed the office of watchman, and cried the hours; and Hector, the faithful watch-dog, who greeted the rising moon with a continued barking.

As the midnight hour sounded, the daring Emily went forth; she had contrived to obtain a master-key which opened all the doors, slipped lightly down the stairs, and through the porch, where she perceived a light from the kitchen. For this reason she jingled a bunch of keys with all her might, slammed the chimney-boards noisily to, and opened the house door and the wicket without resistance; for as soon as the four watchful inmates perceived the unwonted bustle, they imagined it was the arrival of the boisterous nun. The chicken-plucker crept for fear into the kitchen cupboard; the housekeeper into her bed; the watch-dog into his kennel; and the doorkeeper into the straw, where his wife already lay. The maiden reached the open space, and hastened to the little wood, where she fancied she already saw, in the distance, the carriage, with swift horses attached to it, awaiting her. But when she approached nearer it was only a deceitful shadow of a tree. She imagined that, misled by this illusion, she had mistaken the place of rendezvous, and traversed, from end to end, all the paths of the wood; but her knight, and his equipage, were nowhere to be found. Disturbed at this position of things, she knew not what to think. Not to appear at an appointed rendezvous is a bitterly-to-be-atoned crime among lovers; but to remain absent under present circumstances was more than high treason in love. She could not in any way comprehend it. After she had waited in vain for a whole hour, and her heart beat high with anxiety and

cold, she began to weep and lament bitterly. Ah, the faithless man pursues a cruel sport with me! he is in the arms of a rival from whom he cannot tear himself away, and has forgotten my faithful affection! These thoughts suddenly recalled to her recollection her long-forgotten genealogical tree; and she was ashamed of having condescended so far as to love a man without name and without noble sentiments. At the instant that the excess of passion quitted her, reason came to her aid to counsel her how to atone for her error; and this faithful adviser told her to return to the castle, and forget the plight-breaker. She accomplished the first without delay, and arrived safe and sound in her chamber, to the great astonishment of her faithful attendant, to whom she disclosed everything; the second she proposed to accomplish more at leisure, and after further reflection. However, the nameless man was not so guilty as the wrathful Emily imagined. He had not failed in punctually keeping his appointment. His heart was full of transport, and he waited with great impatience to seize the charming prey of love. At the approach of the midnight hour he glided near the castle, and watched for the opening of the wicket. Earlier than he expected, the beloved nun's figure stepped forth. He flew to her from his hiding-place, seized her eagerly in his arms, and said— "I have thee, I hold thee, never will I leave thee; sweet love, thou art mine; sweet love, I am thine; thou mine, I thine, with body and soul." Joyfully did he carry the lovely burden to where his horse stood waiting, and place her beside him on the saddle. No sooner were they seated, than the horse reared and snorted, shook his mane, became restive, and at last galloped furiously over the plain, until a severe shock hurried the rider from his seat, and horse and man rolled over a steep precipice into the abyss below. The tender hero knew not what happened to him, his body was bruised, his skull was fractured, and he lost all consciousness, from the hard fall. When he came to himself, he missed his beloved travelling companion. He passed the remainder of the night in this helpless condition, and was carried in the morning, by some peasants who found him, into the nearest village. His steed had broken his neck, but this troubled him but little. He was in the greatest uneasiness concerning the fate of the lovely Emily; sent people to seek news of her in all highways, but nothing could be learned respecting her. The hour of midnight first dissipated his embarrassment. As the clock struck twelve, the door opened, his lost travelling companion entered, not in the shape of the beautiful Emily, but of the ghostly nun, a frightful wife! The handsome Fritz perceived, with horror, that he had made a great mistake, he felt the sweat of death on his brow, began to sign and bless himself, and to repeat all the pious ejaculations which occurred to him in his fright. The nun was not repelled by these, but advanced to the bed, stroked his glowing cheek with her dry icy hand, and said— "Peace, peace, be at rest, I am thine, and thou art mine, with body and soul." She tormented him thus by her presence for a whole hour by the clock, after which she disappeared. This platonic love-sport was carried on by her every night, and she even followed him to Eichsfeld, where his quarters were.

Here, also, he had no rest nor repose from his ghostly love; he pined and grieved, and quite lost his spirits; so that both men and officers in his regiment perceived his melancholy, and all the honest warriors felt great compassion for him. But the trouble of their brave companion was a riddle to all, for he avoided the disclosure of his unlucky secret. But the handsome Fritz had one confidant among his comrades, an old horse-serjeant, who was reputed an adept in all arts of bleeding; he also possessed, according to report, the lost secret of a charmed life, could summon spirits, and had every day a charmed shot. This skilful warrior besought his friend, with loving importunity, to disclose to him the secret grief which oppressed him. The tortured

martyr to love, who was tired and wearied of life, could not resist, at length, under the seal of secrecy, confessing all. "Brother, is it nothing more than that?" said the ghost-layer, smiling, "thou shalt soon be freed from this torture; follow me to my quarters." Many secret preparations were made, many circles and characters were described on the wall, and, at the command of the master, appeared the midnight ghost, this time at the hour of noon, in a darkened chamber, lighted only by the mournful glimmering of a magic lamp. It was severely punished for its past disorderly conduct and was banished to a hollow willow tree in a solitary valley, with a warning to remain in this lonely Patmos from that hour.

The ghost disappeared; but, at that very moment, there arose a storm and whirlwind which disturbed the whole town. However, there exists an old and pious custom, that when a violent storm of wind arises, twelve deputed citizens mount and ride immediately through the streets in a solemn procession, singing a penitential song to calm the wind.⁽¹⁾ As soon as these booted and well equipped exorcisers were sent out to still the hurricane, her howling voice was silenced, and the ghost was never seen again.

The brave warrior easily perceived that this mummery had been intended as a snare for his poor soul, and was heartily glad that the troublesome spirit had quitted him. He again took the field bravely with the dreaded Wallensteins, and entered Pomerania, where he made three campaigns without news of the charming Emily, and conducted himself so well, that on his return to Bohemia he headed a regiment. He took his way through Vogtland, and when he perceived the castle of Lauenberg in the distance, his heart beat with uneasiness and anxiety respecting the fidelity of his beloved.

He announced himself as a very old friend of the family, without mentioning his name, and gate and door were quickly opened to him, according to the rights of hospitality.

Ah! how horrified was Emily, when he whom she believed unfaithful, the handsome Fritz, entered the apartment. Joy and anger contended for the possession of her gentle soul; she could not resolve to vouchsafe him a friendly glance, and yet this compact with her eyes cost her great resolution. She had been counselling with herself for three years and more, whether she should or should not forget her nameless lover, whom she considered faithless; and in this manner she had not forgotten him for a single moment. His image continually hovered around her, besides which, the god of dreams appeared to patronize him greatly, for all the countless dreams which, since his absence, the maiden had had about him, appeared to be sent on purpose to excuse or defend him. The stately colonel, whose noble salary somewhat abated the careful watchfulness of the mamma, soon found an opportunity to put the apparent coldness of his beloved Emily to the proof. He disclosed to her the frightful adventure of the elopement, and she frankly avowed her sad suspicion that he had broken the vow of fidelity. Both lovers agreed to extend the knowledge of their secret a little farther, and to take mamma into the narrow bounds of their confidence. The good lady was quite as much astonished at the disclosure of the secret attachment of the lovely Emily, as at the account of the "*species facti*" of the elopement. She thought it reasonable that love should repay so severe a trial, but still she found an obstacle, in the nameless man. But when the maiden assured her that it was quite as reasonable to marry a man without a name, as to marry a name without a man, she could not contradict this argument. She, therefore, as there was no count in reserve, and as the secret contract appeared to be mature, granted her parental consent. The handsome Fritz embraced his

charming bride, and the nuptials were happily and peacefully concluded, without interruption from the ghostly nun.

AN ADVENTURE IN THE THREE KINGS DURING THE RIFLE MEETING AT BASLE.

(Concluded.)

My friend had a passion for the coffee-house. He had acquired it in Italy and France. I therefore took leave of my loquacious neighbour, and went out with my correspondent. He treated me in glorious style, and talked about what little business we had to settle.

"*A-propos*," said he at length, "your watches are quite safe with me. But what could have induced you to lose sight of them yourself; or rather, why did not you entrust them to the landlord's keeping? in which case he would have been responsible."

"Why," replied I, "there are a very odd sort of people in our hotel just now; and, if the landlord and his worthy visitors escape unscathed, it will be nothing short of a miracle."

Hercupon I told him the whole affair about Claude Barrault. He shook his head, and thought I ought to inform against the fellow. I was just about laying some of my scruples before him, and clearing my throat to begin, when I noticed my former companion of the table d'hôte, Durand, the Secretary of Police, at my side, who had come quietly in and taken his place close to where we were sitting. He had evidently listened to my tale, for his dark glaring eyes seemed to speak daggers to me, and wholly to deprive me of the power of utterance. In the meanwhile, a boisterous mortal swaggers awkwardly in, bawling out his salutation of "*caro amico, rivedere*," and the like of it. It was the man of Bellinzona. He made a dead set at my friend, and poured into his ears all sorts of little things that he had forgotten to say to him in the morning, over their bargain about the eight hundred dubloons. My friend, too, was "hail fellow well met" with him; for he gave him his arm at once, and walked about with him, talking of this and that, till, holla! and before I can stop them, they are off and away, without either "good-bye," or "God bless you."

Somewhat chagrined at this,—and, true enough, in such a motley whirl of mortals, our heads go round till our best friends are for the moment disregarded by us—I rose from my seat with the intention of leaving the coffee-house; when who should you suppose followed me? the Parisian; and secretly whispered in my ear, "What is all that about Barrault, my good sir?" As I had so far forgotten myself, I told him briefly what I knew; to which he shrewdly replied, "I should make a pretty something, no doubt, if I could lay hold of this atrocious delinquent; but, for the present, I advise you to give no information to the resident police. They have enough to do just now with the Italians, and those mischievous Radicals, and, in such a confused hubbub, they scarcely know which way to turn. However, I will be on the look-out for the rogue. I know him well by sight, and I'll answer for it he shall not escape me."

We were just entering our hotel, when Martin comes up to me, and asks me what I mean to do about leaving. I order him to be ready for the next day, and give him my card, which he is to present to my correspondent in the morning, and fetch away my case of watches. "Quite right, sir," said he, "and do you want nothing more of me to-day? The horses have eaten their corn, the carriage is in order, well washed, and under cover, and the wheels have been greased."

I was trying to recollect whether I had no further orders for my man, when Monsieur Durand begins again.

"You have a carriage of your own?" said he.

I reply in the affirmative.

(1) This Wind procession is observed in the above-mentioned town to this day.

"Oh, let me see your horses; I am a great lover of horses," he continued.

"With pleasure," replied I, in a well-satisfied tone, for I am fond of showing my turn-out, as it happens to be a good one, and my horses no less so. As we were passing the coach-house, I called M. Durand's attention to the carriage. He praised it. "It must have come from Vienna," said he, in a moment.

"You have hit it; you know all about it," said I: "the carriage really was built in Vienna, and it has scarcely its equal for comfort. The nobleman who sold it to me, would gladly have kept it for himself; but his purse was too light. He came fresh from the gambling-tables at Baden:—we know what the world is."

"Gambling, like stealing, is a vice," returned Monsieur Durand. "But your horses, good sir, where are they? I am astonishingly fond of horses, and, moreover, am a member of the Jockey Club in Paris."

Martin opened the stable, where, easily distinguishable from the other horses, stood my gallant greys, slender, yet in good condition; with short, firm pasterns, head and tail both carried high: in fact, real clever Arabs from the breeding-stud of the King of Wurtemberg. To this day, there is neither flaw nor fault in them, except that they neither speak, read, nor write. A pair of out-and-outers they are.

Monsieur clapped his hands in sheer astonishment and ecstasy. He was an extraordinary connoisseur in horses, and praised mine, till Martin, who is like a father to the animals, felt his eyes water again. And, in truth, it did me good to hear him. A man, whose heart is in the right place, cannot endure either his wife, children, horses, or dogs to be slighted. It was not long before Monsieur resumed. "I have long since," said he, "been wishing for such an equipage as this for myself. Our carriages are not substantial, and our horses are good for nothing, and I am not rich enough to send for a coach and horses from England. I am not going by the Strasbourg railway, but am returning to France by way of Lausanne and Neuchâtel, and should be very well pleased to take with me a carriage and horses of my own. Are you not inclined to part with yours, my good sir?"

Good heavens! what will not a tradesman part with if he can get rid of it with profit? At Stettin, at the winter fair, I remember selling my hat off my head, because some one chanced to take a fancy to it. So I said to the Parisian, "For such and such a figure of Napoleons the whole turn-out is at your service." Monsieur Durand considered matters; and, in the meantime, Martin looked at me, shook his head, shrugged his shoulders, and squinted most expressively; I knew very well what he meant; the fool would have liked to live and die with the animals. I paid no heed to his grimaces, and as the Parisian had just made me a much lower offer, I cried out in express defiance of Martin, "I will make an abatement of six Napoleons, and not a single sou further. If this will suit you, well and good." Monsieur Durand again fell to deliberating; and I had my fun in seeing Martin pulling his faces, till the latter stepped up to me,—"What can you be thinking of, master," whispered he in my ear, "to be bargaining away Tartar and Lucy? The Frenchman is unworthy of the beautiful creatures!" Whereupon I gave worthy Martin a fillip.—"What does it matter to you, you booby?" said I. "Are there not plenty of other horses in the world? Or are you inclined to enter into French service with Tartar and Lucy, and see if the gentleman will make you his coachman?—He may, for all I care."

The poor fellow's face glowed like a fire-brand. He hung his head. "That will be my fate, at last," said he, sorrowfully; "I shall be turned off, too! No; I'd rather cart dung my whole life long, or turn coachman with the oxen at the plough!" I was pleased with the fellow, and would gladly have given him my hand, but a master must never show anything like soft-heartedness before his servants, but just act as if everything

was a matter of course, or his underlings will at once have him by the nose. Well, at last, Monsieur Durand made up his mind. "As far as I care," said he, "it shall be a bargain. From this very moment, I make both coach and horses mine, at the price stated. You, coachman and boots, are witnesses."

We shook hands, and I only just settled, as quickly as I could, about a small something for Martin, that the poor sinner might not go away quite empty-handed. After receiving his couple of dollars, which Monsieur Durand produced at once, he stole into a dark corner, and I'll be bound he began to bellow where he stood, and had some little trouble to conceal his tribulation. However, the silly rogues soon forget their sorrows. After Martin, as he afterwards confessed to me, had once more embraced Tartar and Lucy, he came running along after me, while I was on my way with the Parisian to receive my money, and stopping me just at the foot of the stairs—"As both chaise and horses are sold," said he, "I should very much like, if you can spare me, to beg leave to go home and see my mother." (The fellow comes from Grenzach.) The sport hereabouts gives me no pleasure now, and I could not bear to look on while the horses were being taken away."

I at once gave him leave to go; accompanying it with an order that he should be back again by three o'clock the next day, at the very latest, for fear of missing the train. I wanted to go as far as Mühlhauser, and by Schalampi, over the Rhine. He promised faithfully to be to his time, and set off at once. I let him have his way; for his mother is an old woman, and may die any night she takes a fancy to it: so it was quite right of her son to do his best to see her once more. Good sons, mind you, generally make good servants.

On our reaching the coffee-room, Monsieur Durand began looking over his pocket-book, for the purpose of giving me the money, and continued his search an interminably long time. At last he produced a slip of paper. "Do you know that?" said he. It was a letter of credit upon the wealthy house of Forkart, given by Rougemont in Paris, to the amount, I think, of twenty thousand francs. "Yes, to be sure I do," replied I.

"Then I will give you a draught on Forkart," continued he, (as I have not ready cash enough with me,) unless you please to wait till to-morrow; for I have to go to them for money, whether or no."

I, of course, politely assured him that there was no such very great hurry, and that it would be just the same to me if I received my money the next morning. Having settled matters thus, we set off on foot for the rifle-ground; and on our way thither, Monsieur Durand asked me, for the first time, for my name. As it was difficult for him, being a Frenchman, to make it out, I gave him my card and address. Near the Tower of Flags we separated, and agreed to meet again that same evening, in the Café National. There, too, I had appointed to meet my correspondent:

"I was sauntering up and down through thick and thin. It rained pretty fast; and a few paces in advance of me a foreign professor, trying to clear a ditch, happened to leap short, and broke his leg. An immense crowd gathered at the disastrous spot, and I got fairly into the midst of it. All at once I felt some one at my pockets. With no laggard hand I made a clutch behind me, caught hold of a strange hand, held on fast, and looked my prisoner well in the face. I almost thought Claude Barrault was at me; but it was some one else, a pale night-worn looking fellow, a something between a gentleman and a gentleman's servant. The impudent knave; I charged him loudly with stealing, he fell to abusing me; I would not let him go; he kicked and cuffed me. The bystanders imagined we were quarrelling, and dragged us apart. Nothing could be more to the rascal's mind; he slipped away through the crowd like an eel. I felt in my pockets, and missed my handkerchief; a pair of gloves too, and my cigar-case were gone, as also the little silver cigar-holder.

I returned to the town vexed and chagrined. It was just growing dusk. All at once Barrault was at my side; he saluted me and wished me good evening. I kept my pockets close, and gave him a very short answer. I saw nothing but murder and robbery in every corner; thought a good deal about the police, and whether or no I should give the scoundrel beside me into custody.

"You breathe very hard," said I to Mussyer.

"Yes," returned he, "I have been footing it rather fast. I was just falling headlong into the clutches of some one who ought not to know that I am here."

"Monsieur Durand, no doubt," said I indiscreetly.

He darted at me a side glance like lightning. "Do you know Monsieur Durand? How do you—?"

We were standing close to the Café, and knowing that Durand was soon to be there, I artfully said to Barrault, "Come in here with me and I will tell you all about it." But he must have smelt a rat, for he snappishly replied, "I have my reasons for not entering this house. Another time perhaps;" and so saying he went off.

"Wait awhile, wait awhile," grumbled I; "a time of reckoning will come yet," and so saying I went in. Every one knows how people keep appointments. From my earliest boyhood I have always been fool enough to be punctually at the place of rendezvous, and yet ninety-nine times out of a hundred I have been the silly dupe of my friends, and have had to wait for them in vain. This was just the case then in Basle. Where was the smallest trace to be found of my friend and correspondent, or the faintest shadow of M. Police-Secretary Durand? Among all the wet wrappers and ferocious-looking beards, with which the Café National was swarming, I could neither discover the fair smooth face of the man of Basle, nor the trim surtout of my Parisian. At first I was patient; but quarter of an hour after quarter of an hour dribbled away, and my patience was burning away as fast as the wick of the lamp over the billiard-table. At last it went fairly out, and I jogged homewards. In the Three Kings all was as closely packed and noisy as it is in a bee-hive; not one rational word to be heard. I was glad enough to save the tympana of my ears, and take refuge in my room. There I held a grand review of my pocket-book, purse, and watch. But my cigars! What scape-grace was now enjoying them through the little silver holder? What knave was chafing his nose with my real East Indian bandanna? What rascallion fingers were lurking in my goodly gloves? Breathing vengeance I made fast my door and laid my weary limbs to rest; vain hope, alas! I dreamt all night long of house-breakers and cut-throats.

Fortunately day-light soon appeared. In July it usually shows itself betimes. "Away from this bustling Basle to-day," thought I, "where a man can neither make sure of his legs, his life, nor his handkerchief! But, stay a bit,—had I not to pocket the money-first, to take leave of my friend, and to wait for Martin? Accordingly, I determined once more to be patient, and went down to breakfast. As chance would have it, I met the landlord and several of his guests; they were talking promiscuously in an under-tone, and altogether there seemed a great hurry-scurry in the house.

"I hope you have slept well," said the landlord to me.

"Pretty well."

"Do you intend favouring us any longer in Basle?"

"I shall stay till the evening." I was just going to ask for Monsieur Durand's room, when the landlord interrupted me.

"This is a sad piece of business," said he, in an under-tone.

"What piece of business?"

"Zounds! there is a strange rumour afloat in the house."

"Indeed!"

"A desperate fellow has taken up his quarters among us."

"Aha!"

"Do you know about it?"

"I fancy I do; what is it they say about him?"

"Just picture to yourself; the rogue goes out every moment with a fresh coat, and what is more, with a fresh face too."

"Good!"

"At one time he is as smooth as any girl, at another, as bristly as a boar."

"Yes, yes, I know."

"At one time all white and red; at another, brown-faced and pock-marked."

"Yes, yes, I understand you."

"He goes out empty-handed, and comes home loaded, and with well-stuffed pockets."

"To be sure, he steals all he can get at."

"Just so, my good sir; and this dark-brown, pea-green adventurer is your neighbour."

"Exactly so, my neighbour."

"For the security of my house I am going to have his room regularly searched by the police."

"Quite right of you, I am ready to give evidence."

"Excellent! Your neighbour is a cunning file, I fear."

"Not a doubt of it."

"Don't you know who he pretends to be?"

"A manufacturer from Markkirch."

"From Markkirch?"

"Why yes, you know that very well."

"Ah! the miscreant! And he try to pass for a shop-keeper too, in St. Marie-aux-Mines?"

"To be sure he does, you told me.—Hist, here he comes!"

The landlord pointed to the stairs; we were standing at the coffee-room door. Claude Barrault came slowly up.

"That is he," said I.

At the same moment Monsieur Durand appeared, making his way down stairs; a screaming and brawling was heard in the kitchen, and the landlord hurried away to set things at rest. Monsieur Durand saluted me politely, as he passed. "I am just going to Forkart's," said he, "in another hour you will find me here."

"Quite right," said I, "I will wait upon you."

Durand went down stairs, and Barrault up. I followed him with my eyes, and could really see that his pockets—they were those of the pea-coloured coat—were crammed with all sorts of plunder. The fellow was evidently just fresh from a foray, and looking uncommonly well satisfied and saucy. I moved away in search of the landlord, when a waiter followed close on my heels, and striking me roughly on the shoulder; "Man," said he, "the police want you."

"What do the police want with me?"

"You'll hear that soon enough."

I turned round, and sure enough the patrol were standing close to me, together with an individual in fine trim coat, and the individual in the fine trim coat said to me with the greatest possible coolness and composure, "Mr. Matzendorf, I believe, of so and so?"

"At your service."

"Your friend Mr. — has made a deposition at the Town-hall to the effect that you are in quest of one Claude Barrault?"

"Only in quest of him! I have got him, and fast enough too."

"Well, then let it rest with us rather to fix him; he lives in —?"

"He is just this minute come home. Let us after him at once."

The impudent waiter, who had undoubtedly supposed I was going to be clapped up in strait quarters by the police, (for that was what made the scoundrel so brutally familiar) led us, at my request, to my former room.

"Rat-tat-tat!" "Come in." And there was the malefactor, sitting before the glass without his beard, though he still had his wig on; so that we caught him in complete *négligé*. To have seen him lower his crest when he perceived the police.

"Whom are you bringing to me now?" said he, with a terrified air.

"Surrender!" cried I, making a spring at the gun to prevent any chance of a mishap.

"You are our prisoner!" said the whole body of the police.

And now they made a pretty jargon of it. Not a soul could understand a word that was said. Claude Barrault played the refractory to perfection, quite in true French style; but all to no purpose. His chest of drawers was searched, and, true enough, there was nothing there; very few articles in his knapsack; in the dark coat that was hanging on a peg, nothing but a pocket-handkerchief and a slip of paper: but in the pea-green one, there were a couple of bran-new *étuis*, filled with gold-chains, pins, ear-rings, brooches, &c.; all of them set with precious stones. His pocket-book contained a mass of bills of exchange and bank notes; and in his purse were all sorts of gold pieces. The commissary made an inventory of the whole, sealed and locked it up, took with him what he pleased, and sent the delinquent on before to the Town-Hall, under an escort of patrol. Then he bade me follow him to the magistrate, where I made my deposition, stating all I knew about Claude Barrault. The luckless wight himself was sitting in the background, repenting of the thousand insults he had cast in my teeth on my introducing the police into his room.

The case was a long one. At length I was dismissed for the present, with an injunction, however, not to quit Basle. As I passed through the ante-room I saw my landlord, my correspondent, and a host of people, waiting to make their depositions against the thief, who, as they said, had robbed them. Just at the door it occurred to me that I had forgotten to tell the magistrate about Monsieur Durand, who, by the bye, knew Barrault by sight; and I was on the point of returning, when, thought I to myself, "Thank your stars that they have done with you, and make the best of your way home. Time enough to-morrow, since they will not let you leave. At the same time I resolved that my worthy friend and correspondent should have a smart dressing for so efficiently playing the chatter-box, and getting me into this unpleasant dilemma. For I grudged the loss of time still more than the money that I had to get rid of in Basle for bed and board.

And now talking of 'board' reminds me that on my way home I felt the cravings of a most ravenous appetite, which occasioned an extraordinary acceleration of my pace. Thrice happy he who feels hungry just at the right moment, and who is not too merciful to his legs! Without such an appetite, and such alacrity, what would not have befallen me?

Picture to yourselves,—it was the time of the late table-d'hôte in the Three Kings. All the company were at table; the landlord not at home; the landlady, the head-waiter, and his subalterns in the greatest bustle. The porter, already busy with the work of digestion, was leaning with contented vacuity of thought against the door-post; but no, I am wrong—one thought was rife in him, he was speculating on the fee that the gentleman would give him, who was just preparing to get into his carriage and drive off. I approached the vehicle from behind. I was within a hundred paces of it, when, thought I to myself, "To look at it in the rear, that carriage is very much like your own, Matzendorf." All at once I heard a clear and well-known neigh in front of it. "Good heavens, that is Tartar!" thought I, and I darted like lightning towards the vehicle, just as a gentleman was popping out his head, and going to give the porter and hostler their fees. In a moment I seized his hand, "Ha! ha! not so fast, Monsieur Durand," cried I. To be sure there was a fellow on the box who made fine play with his whip on my poor horses, but Lucy and Tartar knew my voice, pricked up their ears, and cared nothing for the Frenchman's *allons, en avant!* or whatever it was.

"What! am I to be cheated?" cried I; "and do you

think to drive off with my coach and horses, without paying for them?" and I rushed, like one possessed, at the door of the carriage, without giving the smallest heed to the bawling and wrangling of the worthy Monsieur Durand. "Don't let the coachman go!" shouted I to the hostler; for that young limb of the devil was leaping like a grasshopper from the box. The hostler, like an honest fellow, laid hands on the rogue. But I should scarcely have managed matters with Durand: he slipped through my fingers like an eel, for the purpose of jumping out of the other door; and heaven knows where he would have been off to, for the porter never stirred an inch the whole time. But, as good fortune would have it, Martin came in just at that moment from Grenzach, and seeing me in hot pursuit of Monsieur Durand, he at once took the hint; and, in short, Monsieur Durand was in his clutches before he had time to say *Adieu*.

The run of the whole provoking affair was the following:

The *soi-disant* Durand had watched an opportunity, when the people of the hotel had their hands full of business, and, with the aid of his scoundrel of an accomplice, had managed to get possession of both coach and horses. The hostler, who had been a witness of our bargain, thought the thing was settled, and soon struck his colours before a piece of effrontery which appeared to him to be a justly-acquired right. So Monsieur Durand had intended to take his leave of me, *à la Française*; but he had reckoned without his host; at least, without taking my hunger and locomotive power into account.

While I was heaping my invectives on the Frenchman in the street,—(a dense crowd, by the bye, soon gathered round us),—and hallooing for the patrol, my eye happened to fall on M. Durand's respectable coachman; and now I shouted louder still, for who should the rogue be, but the very same fellow who had smoked my cigars, used my pocket-handkerchief, and done dishonour to my gloves? The latter articles were found upon him; and in the chaise was a piece of goods that almost threw me into a swoon to look at it. If it was hard enough in the villain to wish to make off with my coach and horses, it was certainly still harder in him to covet my case of watches in the bargain. With the card I had given him, the thorough-paced rascal had sent his helpmate to my friend, and one of the under clerks, a privileged time-killer, in the full scope of his stupidity, had delivered up the case!

At length the city-watch came up, and the most miscellaneous mass of articles were unhoused, in boxes full, from my innocent carriage. All of them were stolen goods; and the magistrate, who got Monsieur Durand into his clutches, hugged him so unkindly, that on the very next day he confessed himself to be Claude Barrault, and a most notorious thief. A pretty scrape I might soon have been in!

As to the man of Markirch, he really did come from Markirch; though he was somewhat more jealous than discreet. All that he had told me was true, even to his very name; and he scarcely could have chosen a more unlucky one. To be sure, he never knew, for a moment, that such a rascal laid claim to it. Having found his beloved true to him, instead of faithless; and having learned that the young damsel was as madly smitten with him as he was with her, he had fairly bought up a couple of jewellers, in order to enhance his attentions to his mistress by a few costly keepsakes; and these handsome presents were the very means of fastening suspicion upon him: just as it often happens in the world, where we are ready to believe all that is bad, and to doubt of what is good. What served to aggravate the misunderstanding was, that his rival's name was Durand!

The hero of Markirch—and really I cannot altogether blame him—talked very loudly, for a time, of taking me by the ears, or sending a bullet through my body. But, whether it was that some of his less mettlesome friends quieted him, that his intended spoke a good word for

me, or that his own good sense got the upper hand of him, and convinced him that he was the very person who had laid the groundwork of this grievous misnomer,—however it may have been, the matter was made up, and ere long we had a hearty laugh at our adventure in the Three Kings, over a bottle of capital Bourdeaux. My correspondent got a double rasping from me, and received it with the utmost meekness. Monsieur Durand, in common with many other light-fingered gentry and errant ladies, had to make their most of Swiss fare for a time, till they were restored to their native soil, where they now live privately, on government pensions, in Brest and Toulon. But honest Lucy, and Tartar with his sagacious neigh, are to this very day in my stable, unmolested by the smallest hankering after France. Martin, having succeeded in retaining his beloved animals, has again recovered his self-possession and confidence; and when he drives me into the country, he is sure never to forget to say to me, with a cunning smile, "But how would it have been, master, if I had just got five minutes later to Basle? It was quite a misgiving at the time, that would not let me feel at ease while I was with my mother; and nothing short of death shall part them two horses and me, if it is all the same to you, master."

POPULAR YEAR-BOOK.

June 24.—Feast of St. John Baptist;

OR, MIDSUMMER DAY.

ST. AUGUSTINE says, that the faithful had received by tradition from the ancients the observance of the nativity of St. John the Baptist, and the Council of Agde, in 506, reckons it the first festival after those of the chief mysteries of our redemption. It is celebrated by the Church of England. On this day the people formerly kept their doors and windows embowered in the branches set up the eve before, upon the belief that these had a virtue in averting thunder, tempest, and "all kinds of noxious physical agencies." In Oxford there was lately a remarkable usage, mentioned by the Rev. W. Jones, of Nayland, in his life of Bishop Horne. He remarks, "a letter of July 25th, 1755, informed me that Mr. Horne, according to an established custom at Magdalen College in Oxford, had begun to preach before the University on the day of St. John the Baptist. For the preaching of which annual sermon, a permanent pulpit of stone is inserted in a corner of the first quadrangle; and so long as the stone pulpit was in use (of which I have been a witness), the quadrangle was furnished round the sides with a large fence of green boughs, that the preaching might more nearly resemble that of John the Baptist in the wilderness; and a pleasant sight it was: but for many years the custom has been discontinued, and the assembly have thought it safer to take shelter under the roof of the chapel."

June 28.—St. Peter's Eve.

This, in the current year, is also the first Sunday after Midsummer Day, upon which, according to ancient custom, the fraternity of Fellowship Porters of the city of London annually repair to the church of St. Mary-at-hill in the morning, where, during the reading of the Psalms, they reverently approach the altar, two and two, on the rails of which are placed two basins, and into these they put their several offerings. They are generally followed by the congregation, and the money offered is distributed among the aged, poor, and "decayed" members of that fraternity. The rites of St. John Baptist's Eve were also observed on this; and Dr. Moresin relates that in Scotland the people used to run about on the mountains, and higher grounds, with lighted torches. Something similar to this was practised on this vigil about a century ago, in Northumberland. The inhabitants carried firebrands about the fields of their respective villages. They made encroachments, on these

occasions, upon the bonfires of the neighbouring towns, of which they forcibly took away some of the ashes. This they called "carrying off the flower of the wake."

June 29.—Feast of St. Peter.

In the Greek and Latin Churches St. Paul is commemorated with St. Peter on this festival. Several of our parish churches, founded before the Reformation, were consecrated under the invocation of these Apostles conjointly, and their several wakes and fairs are annually celebrated accordingly. The feast of SS. Peter and Paul is of the highest antiquity and solemnity. For some unexplained reason the English Church dedicates this day to St. Peter alone; and commemorates St. Paul by his conversion, on the 25th January. The Eton boys formerly had a great bonfire annually, on the east side of the church, on the feast of St. Peter as well as on that of St. John Baptist. In an old account of the lordship of Gisborough, in Cleveland, Yorkshire, it is stated that the fishermen, "upon St. Peter's day, invite their friends and kinsfolk to a festival kept after their fashion, with a free heart and no show of niggardness: that day their boats are dressed curiously for the show; their masts are painted, and certain rites observed amongst them, with sprinkling their prows with good liquor." The illuminations at Rome, on this day, are extremely magnificent.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

TO A LITTLE GIRL, AGED THREE YEARS AND A-HALF.

BY S. M.

DEEP in thy round blue eyes
Asleep thy spirit lies,
Or half-awake, and wanton in its play,
As are the thoughts of those
Who dally with repose,
Dreaming, at noon, the summer hours away.
To thee each sight or sound
Of Life's most common round,
Twilight or morn, green field or waving tree,
Bird, flower, or trembling star,
Food for sweet wonder are,
Choice spectacles, prepared to pleasure thee.
Along Earth's dreary scene,
Thou, fearless and serene,
As in a softer air dost breathe and move;
Each of thy smiles or tears
A potent cause appears
For fresh caresses, and for fonder love.
No despot's court could be
Servile as thine to thee,
Thy casual gestures watching and recording;
No sage or bard divine
Finds audience such as thine,
Thy half-form'd words as priceless treasure hoarding.
We look on thee, and smile;
The saddest hearts awhile
Forget their woes in thy resistless mirth,
As, mid thick clouds we view
One spot of stainless blue,
So shows thy life among the griefs of earth!
We look on thee and weep,
When from its happy sleep
Thy soul to its appointed task shall rise:
Must ruthless Sorrow chase
The brightness from that face,
Must tears become familiar to those eyes?
We look on thee, and fear;
How can we greet thee here,
Thou sinless stranger in a world of shame?
Shall earthly breath or blight
Sully the stainless white
Whereon was written once thy Saviour's name?

Childhood's unconscious heart,
An awful thing thou art!
An ark of peace with ceaseless storms around;
Man—ere thou dare intrude
On that pure solitude,
Put off thy shoes—the place is holy ground!

Well may we gaze on thee
Fresh in thy purity,
By no doubt troubled, by no sin defiled,
And pray—(God spake the word)
“Teach us to love thee, Lord,
Even in the spirit of a little child!”

SONNET: TO THE REDBREAST.

WHEN that the fields put on their gay attire,
Thou silent sitt'st near brake or river's brim,
Whilst the gay thrush sings loud from covert dim;
But when pale Winter lights the social fire,
And meads with slime are spent and ways with mire,
Thou charm'st us with thy soft and solemn hymn,
From thatlement or barn, or hay-stack trim;
And now not seldom tun'st, as if for hire,
Thy thrilling pipe to me, waiting to catch
The pittance due to thy well-warbled song:
Sweet bird, sing on! for oft near lonely hatch,
Like thee, myself have pleased the rustic throng,
And oft for entrance 'neath the peaceful thatch,
Paid the cheap tribute of a simple song.

THE PAINTER'S TRAVELLING-SONG.

(From the German.)

BY J. M.

I.

WHAT on earth can happier be
Than is the painter's life?
When spring-time decks the blooming lea,
He quits the city's strife;
No matter though his purse be tight,
His hand is quick—his eye is bright.

II.

He hears the lark's first notes of glee,
And sees the dawn of day;
What purer joy than this can be
To wander far away,
Where all creation's charms combine
To form a portraiture divine!

III.

In union with the joyous lark,
He sings a higher song,
And well the shifting scenes can mark,
While journeying along:
The rustic on his sketches gaze,
And their rare skill and beauty praise.

IV.

When noon is past 'tis time to dine;—
Politely bowing low,
He asks mine hostess of “The Vine”
To be allowed to shew
His skill, by sketching her sweet face;—
'Tis granted with a blushing grace.

V.

This pays for dinner and for wine;
And should the daughter pass—
The painter's eye can well divine
What brings the tripping lass:—
Her laughing portrait, too, he takes,
And the good “Vine” his quarters makes.

VI.

So through the world the painter hies,
Intent its scenes to seize;
And if his painting you despise,
His song may haply please;
As specimen take this brief strain,
And should he fail, he'll try again.

Miscellaneous.

“I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them.”—*Montaigne*.

He that denies to give alms for fear of being poor, or to entertain a disciple for fear of being suspected of the party, or to own a duty for fear of being put to venture for a crown; he that takes part of the intemperance, because he dares not displease the company, or in any sense fears the fears of the world, and not the fear of God,—this man enters into his portion of fear betimes, but it will not be finished to eternal ages. To fear the censures of men, when God is your judge; to fear their evil, when God is your defence; to fear death, when he is the entrance to life and felicity, is unreasonable and pernicious; but if you will turn your passion into duty, and joy, and security, fear to offend God; to enter voluntarily into temptation; fear the alluring face of lust, and the smooth entertainments of intemperance; fear the anger of God, when you have deserved it; and, when you have recovered from the snare, then infinitely fear to return into that condition, in which, whosoever dwells, is the heir of fear and eternal sorrow.—*Jeremy Taylor*.

It is a common remark, that the advantages enjoyed by a numerous family are pretty nearly compensated by the greater number of misfortunes to which, of course, they are liable. But it has seldom been observed how much more patiently such misfortunes are borne; the superior advantages of community in affliction are fully equal to those experienced in the participation of enjoyment. More topics of consolation are presented, in proportion to the number; there is a generous rivalry in administering to the general consolation, which receives its reward in a more prompt and complete mastery over individual feeling; and, frequently, one rises above the rest, with all the authority of a prophet, to whose guidance all submit, and, in the submission, find employment for that redundant affection, the immediate object of which is now no more.—*Rector of Valeshead*.

It has often struck me as very strange, that, amid all the instruction given to our youth, the grandest, and yet commonest occasion in life, the hour of sorrow, is left totally unprovided for. I should rather say, perhaps, that wrong notions are indirectly instilled upon the subject; at least, I know that it requires a parent's constant care to counteract that admiration which the boy, in his classical reading, imbibes of the heathen examples of fortitude. Such fortitude is assuredly vitally opposed to the true christian spirit. It is the sulky patience which endures what it cannot avoid, the rebellious pride of the reptile which defies and hisses in the very act of being crushed.—*Ibid*.

THE MAIDEN AUNT.

DUNCOMBE PARK.

[COLONEL HARWOOD was the husband of Jane, the next sister of Margaret Forde. Mrs. Harwood brought her lord a son and a daughter within the first three years of their marriage. Ten years afterwards she died in giving birth to a second little girl. The disconsolate widower went to reside in France, both to divert his own grief by change of scene, and to afford his daughters the advantages of education, which that region of indefinite extension, the *Continent*, is in England somewhat vaguely supposed to afford. He did not return till his two eldest children had attained the ages, respectively, of twenty-six and twenty-eight, while Janet, the youngest had just passed her sixteenth birthday.]

CHAP. I.

Dec. 14th.—It was an interesting visit on which I entered to-day, and I felt unusually nervous as my humble one-horse fly drove through the great gates of Duncombe Park, and finally deposited me, my carpet-bag, my trunk, my bandbox, my two baskets, and my seven parcels, beneath the stately portico of the mansion itself. I was ashamed to burthen the dignified footman with all my odds and ends, especially as I saw him raise a wistful look, first to the coach-box and then to the

door, evidently expecting to see my lady's maid in the act of descending; and, when he became convinced that I travelled without any such appendage, I detected a spice of contempt in the elaborate civility with which he took package after package from my hands to deposit them on the hall table. I was afraid lest the yet grander butler, who stood behind, should see my prunella shoes; which I carried in a separate parcel that I might not have to fish them up from the bottom of the bag when making my toilette for dinner; so I thrust them into my spacious pocket in a great hurry, somewhat to the disadvantage of the symmetry of my figure, and affecting a lofty indifference as to the fate of that precious heap of parcels, every one of which I longed to carry up stairs and unfasten with my own hands, I followed my conductor across the marble floor. On the threshold of the drawing-room I was met by my brother-in-law, who took me by both hands, and welcomed me in the kindest possible manner. "My dear Miss Forde," said he, "I can assure you that this is one of the most gratifying moments I have experienced since I left the Continent." Then, giving me his arm, he led me forward and introduced me to his daughters, the elder of whom submitted to my embrace, while the younger cordially returned it. During the five or ten minutes which elapsed before I was conducted to my bedroom to dress, I had time to make a rapid survey of the trio, and compare them with

the faces of thirteen years ago, which still remained vividly impressed on my memory.

My brother-in-law is still a fine-looking man. He has grown somewhat portly, and a tendency to gout in the left foot has caused him to change his former activity of movement for a deliberateness which is not, however, without dignity. He has the same sweet smile, and his voice is even more gentle, his manners more bland than they used to be. Well, people may say what they please, but I never can believe he has so bad a temper as he is reported to have. Surely, if he were really so passionate, I must have seen some specimens of it before now. It is true that many circumstances prevented my having much intercourse with him during my poor sister's lifetime, and that, more than once, when I have seen them together, I have fancied that she seemed afraid of him; yet his deportment to her was ever that of a devoted husband, and it really seems impossible that an expression of countenance so benevolent, and a manner of speaking so unusually mild, should belong to a man of violent temper. He is said moreover, to be proud, and that I believe, although his bearing shows no symptom of it, except, perhaps, a certain elaborateness in his courtesies, which, as Owen used to say, "when you see in a gentleman, you may be sure that he looks down upon you." Perhaps Owen would draw a similar conclusion from his studious gentleness; but Owen is a caustic observer, and, though such persons always pique themselves on their perception of character, I do not find that they are generally so right in the end as those who take a more charitable view of their fellow-creatures. As for myself, I do not know that I can be called a good judge of character, but somehow or other I do manage to be generally on comfortable terms with all the manifold varieties that I encounter; and it has more than once been remarked, that I have a true feminine gift of winning influence over even the obstinate. I hope I am not vain of this, and, if it be true that I do possess such a power, I hope that I may always use it for good. At any rate I am not going to quarrel with my good brother-in-law, or to hunt for defects in his character just at the time when he is giving me so affectionate a reception.

My niece Anna is not so handsome as she promised to be at fifteen; but she has a fine figure and a very sensible countenance. Her manners are a curious contrast to her father's; they are positively abrupt, and, as she never smiles when she speaks, the first impression is certainly not pleasing. I should say she was a little ungracious; but I daresay it is fancy. I am so accustomed to breathe a warm atmosphere of love, that I feel chilled and oppressed without it; but how unreasonable is it to expect that a niece whom I have seen very little of for the first fifteen years of her life, and not at all since, should love me by instinct. I must try to win her affections, and it shall be hard if she baffles me in the attempt.

Janet is a sweet creature; very shy and downcast, but with the brightest little face I ever beheld when she smiles at you. She is very pretty, and very like her mother: tall, slender, and blue-eyed, with her fair young face in a perpetual blush. She glanced so kindly at me through her long eye-lashes, that I could not help taking her hand in mine as we sat side by side, and indeed, I should have ventured on another embrace, if Anna's eyes had not rested upon us at the moment, with a half-surprised expression which deterred me. And where, thought I, is my old friend and favourite Charles? But I concluded he was engaged in some one of those mysterious occupations which always separate young men from their families during the morning hours, even if they are neither students nor sportsmen, and that I should see him at the dinner-table.

"I hope you have not suffered from cold during your journey at this unpropitious season, Miss Forde," observed Colonel Harwood; "Anna, is there a good fire in your aunt's room? We must be careful of our visitor's comforts, you know."

"I have no doubt there is, papa," returned Anna, "White seldom neglects her duties."

"I went in just before I came down stairs, papa," said Janet, "and saw that everything was comfortable for aunt Margaret."

"This is my little housekeeper," said the colonel, putting his hand on Janet's shoulder with a smile. "You will find differences of character in your two nieces. Anna is fond of her books, and Janet studies the details of every-day life. I am no foe to varieties of character—developes rather than change, guide rather than check, that has been my system of education. Faults must of course be cured—and they both have their faults: but they have also their peculiarities, and I am by no means prepared to say that those peculiarities are faults."

During this speech Anna looked cross and Janet awkward, while I felt it impossible to make any answer whatever, except a little absurd laugh, of which I was ashamed because it was so unmeaning. "All very wise and right, my dear brother-in-law," thought I, "but are you not a little, just the very least bit in the world, pompous? And is it not very unpleasant for your daughters to be described before their faces in that manner?" Somehow or other the conversation flagged after that speech of the colonel's.

"Will you not like to dress, Miss Forde—aunt Margaret?" asked Anna after a pause. I acquiesced, and we were quitting the room, when I was checked by hearing my brother-in-law say in his politest tone, "Have you not dropped something, Miss Forde? Here, Janet, take this to your aunt." He stooped, with some difficulty owing to his gouty foot, and lifted my unhappy shoes off the carpet. I was the more annoyed as the parcel had opened, and discovered two or three little *last thoughts* which I had popped in with the shoes just before starting. He collected with the utmost care a pair of black silk mittens, a paper of pins, some boot-laces, and, alas! that it must be confessed, a small box of corn-plaster, all of which he presented to me with an air of complete unconsciousness.

I could scarcely conceal my vexation. Janet could not restrain a burst of girlish laughter; her father turned to her in displeased surprise. The poor child became crimson; but I put my arm round her waist, and drew her out of the room with me, joining the laugh as I did so, for the whole matter was so ludicrous that my annoyance soon gave way to amusement. "Oh aunt!" she began apologetically, when we reached the staircase. "Don't say a word about it, my love," interrupted I; "old maids, you know, are privileged to have oddities, and henceforth I grant you the privilege of laughing at all mine as fast as you find them out. But tell me, where is Charles? I shall see him, shall I not?"

Janet's face became gravity itself, and Anna answered "No, he is not at home."

"Not at home!" repeated I, in dismay, "but he will return before I go, I hope."

"I do not think there is any chance of his being able to do so," replied Anna, shortly. Her manner was so decided, and Janet's eyes had become so tearful since her brother's name was mentioned, that I felt sure there was some mystery behind the scenes, and did not like to say any more. An hour afterwards our little party assembled at dinner. The colonel was the kindest and politest of hosts, but I did not feel very gracious towards him, for I was sure, from Janet's flushed face and timid manner, that she had undergone a lecture on the ill-breeding of laughing at her aunt. Nevertheless, it is evident to me that he is an affectionate father, though, doubtless, somewhat too much of a disciplinarian; both the girls seemed fond though afraid of him, and his manner to the dear little culprit evidently shows that he has forgiven her misdemeanour, after duly reprimanding her for it. I wish with all my heart that he did not think himself such a perfect father, and feel bound to keep up his character on every occasion. Striving after perfection is doubtless right, but constantly trying to

act up to an inward self-consciousness of perfection is a very different and a far less pleasant thing. I must take myself to task about my brother-in-law. I am beginning already to find his company a perpetual little provocation to me, and this is both tiresome and ridiculous. I cannot describe what there is about him which I do not like—he is kind, hospitable, sensible, and gentlemanlike; but there is a sort of elaborateness and self-consciousness about all he does and says, which I greatly wish I had not observed, because it teases me, and perhaps after all it is only fancy. It seems as if he were perpetually saying in his own mind, "Now I am being the courteous host—now I am going to speak as the kind brother—this must be said with an encouraging bow to Miss Forde—now I am showing by my manners that I think women have a full right to express their opinions, but delicately conveying at the same time that they should always express them with modesty. I never forget the well-bred gentleman in the affectionate relation, nor the affectionate relation in the well-bred gentleman." Oh, if you could but forget *yourself*, you would be a very agreeable man! But it is foolish and even ungrateful to think in this manner, and I will put it out of my head if I can.

"We are but a small Christmas party," observed the colonel, "I have not yet been sufficiently long at home to renew my acquaintance with the other members of our family, of whom I have lost sight for so many years. I confess that I am fond of family meetings, and always encourage them. They are *right*, and I generally find that what is right is also agreeable."

"You must have been lonely sometimes, when you were abroad," said I. "I think the seasons at which those happy unions are natural and habitual, must be very desolate when you have no familiar faces to gather around you."

"It was a deprivation, certainly," returned he, "but I do not think we were lonely. I hope we have too many resources in ourselves and in each other to find any situation lonely. I should be almost as sorry to find my children dependent on society, as disdainful of it."

I felt nearly out of patience, but scolded myself for my absurdity, and replied very civilly that I thought he was perfectly right.

"I must look to you," he continued, "for information concerning those with whom I hope, ere long, to become personally intimate. You have just been staying with the Bryants, have you not?"

I acquiesced, and said a few warm words in praise of those dear creatures.

"My girls," proceeded the colonel, "anticipate much pleasure and profit from the society of their cousins. Anna is looking forward to an acquaintance with Katharine, who must I think be nearly her own age. Is it not so, Anna?"

"I really don't know, papa," returned Anna; "I have not the slightest recollection of my cousin Katharine, and I never thought about her age."

"She is five-and-twenty," said I, secretly amused at seeing that the colonel appeared a little disconcerted by this speech. "Do you remember Frederic? He has just been distinguishing himself greatly at college."

"He promised to be clever," remarked the colonel, "though I should have supposed him rather brilliant than solid. He visited us at Nice, during his first college vacation, and I observed, then, a certain tendency to repartee in conversation, a disinclination to the steady pursuit of any discussion, and indeed, in some instances, an apparent incapacity to feel the force of the arguments which were employed against him, which, however natural in so young a man—and I hope I am always ready to make allowances for youth—were more creditable to his wit and imagination than to his judgment."

"He has just taken a double first class," said I, as demurely as I could.

"Indeed!" replied my brother-in-law, "I rejoice to

hear it. And George—he must be growing into a man now—has he not some unfortunate impediment in his speech?"

"He stammers a little," answered I, "but we hope it is improving. It will be a great disadvantage to him if he enters the church."

"A great deal more may be done towards curing or concealing those little natural defects than people are apt to imagine," observed the colonel, complacently; "I speak from experience. If I were so unfortunate as to stammer, I should assume a slow, and, as it were, explanatory mode of speaking, by which the repetition of the word or syllable would generally be avoided, and in which, when such a repetition *did* occur, it would seem rather an intentional emphasis, in character with the manner, than an inevitable defect."

"Do you think stammering could be cured by such a system, papa?" asked Anna.

"I am not prepared to say that it could be cured, my dear," returned her father, "but I believe it might, except in very bad cases, be rendered perfectly inoffensive. In a somewhat analogous case, I have followed a similar plan myself, with complete success. Since I last saw Miss Forde—" (with a bow and a smile to me) "I have been afflicted with a slight tendency to gout, but by adopting a slower manner of moving, which is certainly not unsuited to my advancing years," [another smile,] "I have so effectually concealed it, that I would venture to say, that no person, unacquainted with the circumstance, would ever guess it; and that Miss Forde herself would be puzzled to decide in which foot the malady lay."

By the time he had finished this speech, he had turned to me with an air of modest and triumphant inquiry, and I was once more reduced to my little stupid laugh, for in the first five minutes I had seen as clearly as possible that he had got the gout, that he had it in his left foot, and that he was trying to look as if he had not got it at all. Fortunately his self-complacency on this subject was too secure to be easily alarmed, and he took my short chuckle for a sign of complete approbation. Soon afterwards we rose to quit the dining-room, the Colonel holding the door open for us with profound politeness. As we passed out, he stopped Janet, put his arm round her waist, and kissed her cheek, I suppose, in token of complete reconciliation. After all, he is a good creature, and I like him very much.

Anna apologized for leaving me alone with her sister till tea-time. She is learning German, and her master, who has many engagements in Exeter, which is fourteen miles from Duncombe Park, is able to attend her only at this unusual hour. I was not sorry for the opportunity of improving my acquaintance with my youngest and most attractive niece, so we sat down together on the sofa, and in a very short time she was chattering away with innocent freedom, and with a fluency for which I had scarcely given her credit. "But, tell me," said I, after listening with interest to her glowing description of the last year which they had spent at Rome, when, as she observed, she was beginning to be old enough really to enjoy the wonders, and appreciate the advantages, around her, "tell me something about Charles. Was he with you at Rome?"

"No," she replied, casting down her eyes, while her face was overspread with sadness; "it had all happened before then."

"It!—what?" inquired I, my curiosity now thoroughly roused. "What is the matter about my favourite, Charles?"

"Oh, aunt Margaret, that is just what I wish so much to tell you," returned the little girl; "I have got a letter for you from him," added she, first giving a cautious glance round the room, and then drawing a paper from her pocket, which she hastily put into my hand, "but before you read it, I must tell you a little, or you will not understand it. Charles is married."

"Married!" repeated I, in utter amazement, yet scarcely able to keep from laughing at the absurdity of

the thing—that my heedless nephew should be a husband, and that he should employ his little sister clandestinely to convey a letter on the subject to me, his almost unknown aunt, was really altogether so very astonishing, and so completely puzzling, that the eagerness with which I demanded further information, was no more than might have been expected. Janet informed me, that Charles had become attached to a young French lady at Nice, and that, his father's prejudice against an alliance with a foreigner being absolutely insurmountable, he had married her privately, about four years ago. With all the sanguine ardour of his character, he hoped that the Colonel would pardon him when the thing was irrevocably done, though he never would have permitted him to do it. He was woefully mistaken. "Oh, aunt Margaret," said the innocent narrator, "I never shall forget the evening when it all came out. It was very dreadful. Charles had been away for about a fortnight—he pretended it was to make a little tour—but, in reality, he had gone to be married to Mademoiselle de Millebrun. We were all sitting at tea, when there was a loud ring at the bell, and the next moment the door opened, and in he came. He looked odd and excited, as I afterwards remembered, but at the time I was so pleased to see him return unexpectedly, that I did not notice it, but jumped up to kiss him, while papa said, a little gravely, 'Why, Charles, you have taken us quite by surprise. We have not received any letter,—but I suppose you wrote, to announce that you were coming?' Papa particularly dislikes surprises of any kind."

"I dare say he does," rejoined I, observing that she paused, and I added, in my own mind, "they must break in terribly upon those systematic methods of moving and speaking, which he thinks so clever."

Janet continued:—

"Well, I scarcely know how it all happened, and, indeed, I hardly understood it, even then,—but, after a few incoherent attempts to talk as usual, he broke quite desperately into the subject. 'My dear father,' said he, 'will you forgive me for the first disobedience to your commands of which I have ever been guilty? My—' here he hesitated,—'you know, my—the strength of my affection for Adèle—for Mademoiselle de Millebrun, and,—My father stood up, and his face was terrible with anger—it was quite white, and he drew his lips together as if he were almost afraid of speaking. 'Anna and Janet,' said he, in a very low quick voice, 'go to your own rooms—I do not choose that you should hear this.' Anna got up, and left the room directly, and I stole after her, quite terrified, for, you know, I love Charles so very dearly, and so I could not help lingering a little, and was just going to take his hand, for sometimes, when papa is angry, he lets me coax him, and is quite kind again. But I did not understand how terribly serious he was now, and I met a glance from his eye which frightened me so much, that I dared not stay. Half-an-hour passed—oh, what a half-hour it was! I was by myself, and in the dark—I had a kind of feeling that I would not ring for a candle, lest the servants should find anything out, so I sat down on my bed, and cried, I hardly knew why, and tried to hear the sound of their voices in the room below, but I only heard Charles's voice now and then, and that was a bad sign, for when papa is excessively angry, he always speaks low. Suddenly there was total silence; and, a minute afterwards, I heard a step at my door, and a whisper, 'Janet, are you there?' I ran forwards, and poor Charles clasped me in his arms, and kissed me again and again. I felt his hot tears upon my cheek, and I sobbed, so that I could not speak to him, and he said nothing but 'Good-bye, my own darling! God bless you! good-bye!'—at last he seemed to make a great effort to control himself, and said to me, hurriedly, and in a whisper, as if he was afraid of being interrupted or overheard, 'My dearest Janet, you are not old enough to understand all that has happened,

but thus much, I must tell you. I am married to Mademoiselle de Millebrun—she is now my wife, and she already loves you as a sister—and Anna, too, of course. But my father is very angry about it, and has desired me to go away, and refused to see my wife, or to allow me to see you, my own sisters, again. He says he will never forgive me, and though he did not blame Adèle so much, because she is so very young, only seventeen, he said over and over again, that as long as he lived, I should never set foot within his doors again. I am afraid he will keep this promise only too strictly, and so I have stolen up stairs to say good-bye to you, and to beg you, as you grow older, never to forget this last conversation—never to forget how much I love you, nor that I have told you, that upon my word and honour, your new sister, Adèle, is as innocent as a child, and that you must think of her with affection, and never suffer any body to teach you to think unkindly either of her or of me. Will you promise me this?' You can fancy how I felt, aunt Margaret, and what I answered, as well as I could for my tears. I am not telling you about myself, you know, but about Charles. He then went on to say, that he was afraid of doing wrong in telling such a child as I was to hide anything from my father, but he did not know what to do, he could not bear to go on without hearing from me and writing to me. So he settled this plan. We have an old nurse who has lived with us ever since papa married, and who is so fond of Charles that she would cut off her hand to do him a pleasure. Twice a-year Charles was to write to me under cover to her, and I was to answer his letter, and trust to her to get it taken secretly to the post—"

"It was not right, my love," interposed I; "he should not have done it. I pity him very very much—but, indeed, it was wrong."

"It is more my fault than his," returned Janet, blushing with earnestness. "In the second letter that Charles sent me he told me that he felt he had done wrong, that his conscience was uneasy on the subject, and that, great as was the sacrifice, he must give up hearing from me. But I could not bear it, so I persisted in writing to him just the same, and, you know, he could not help answering my letters."

"Well, well," said I, inwardly feeling that in poor Charles the boy was truly father to the man, and that he had grown up the same impetuous, warm-hearted creature, governed by impulse rather than principle, that he was at fourteen,— "Well, well, Janet, go on with your story."

"There is not much more to tell," she answered, "Charles made me fetch Anna to wish him good-bye—"

"Oh!" said I;—"And Anna—is she very fond of Charles? Why did he not go to her instead of to you?"

"Because," replied Janet, with a little embarrassment, "he knew Anna would never have agreed to write to him against papa's wishes—besides, Anna and Charles—I don't know—they used not to be so very fond of each other—they used sometimes to quarrel. But Anna was very sorry indeed, and cried a great deal, both that night and the next morning. I often thought she was vexed, too, that Charles did not go first to her, for she never would speak upon the subject at all, but if ever I mentioned it, she bade me 'never mind,' and said, 'I was too young to be able to understand anything about it.'"

"Does she not know that you write to Charles, then?" asked I, in some surprise.

"Oh, no, no! I dare not tell her; she would think it wrong, and then she would tell papa directly."

"And has she heard nothing of her brother, then, for four years?" cried I, unable to suppress my wonder.

"Yes; she has heard of him now and then, through a third person," answered Janet; "Charles and his wife settled at Boulogne—they are very very poor, and he wanted to live as cheaply as possible, but, I believe, he

has found the place dearer than he expected. Now, we have a friend near Boulogne, with whom Anna corresponds, and this lady always writes word how Charles is; from her, too, papa and Anna heard of the births of his two children. Anna always gives the letters to papa, but he never makes any comment upon them."

"And Colonel Harwood has never shown any signs of relenting? Four years!—It is a long time to be angry with a son."

"Why, I am coming to that," said Janet; "it is the strangest part of all. Anna's friend, who wishes well to Charles, has more than once written to say how very poor he is—how much distressed in his circumstances. He has tried to support himself by giving lessons in English, Latin, and drawing, in which he is a proficient; but he got very few pupils, and now he has three persons besides himself to maintain, and he grows poorer and poorer. At first, he could not bear that Adèle should work too, but he has been obliged to give up his objection, and she embroiders, and teaches music, but still they earn very little."

"Has Adèle no relations?" interrupted I.

"No, none," said Janet. "Her family was well-nigh extirpated at the time of the Revolution. Her mother was its only living representative besides herself, and she died a year after Adèle's marriage. I believe her fortune, which is very very small, is all they have to live upon except their earnings."

"And his father can bear to know this!" exclaimed I.

(To be continued.)

THE HISTORY OF GARDENING.

"Oh! flowers,

My early visitation, and my last
At even, which I had bred up with tender hand
From the first opening bud, and gave ye names;
Who now shall rear ye to the sun, or rank
Your tribes, and water from the ambrosial fount?"

MILTON.

Thus has our Poet painted Eve as the earliest gardener;—and well may we imagine her among the flowers of the newly decorated world, "herself a fairer flower." A modern artist has sculptured Eve at the fountain, surveying with wonder and admiration the beauty with which her Maker had gifted her; we might picture her afterwards among her flowers, while the thought crosses her mind,—“Shall I also fade and be renewed again?” She might then seek Adam, and, while her trembling hand showers at his feet the fading rose leaves, she might ask, “Is all beauty thus doomed to wither?” Her partner guesses not the chain of her thoughts; he has not gazed at the fountain; it is not mere beauty that he admires in her; and, while he tenderly replies to her question, he applies it to the vegetable world only. “Yes, this rose which fades in the sunset will be succeeded by the young bud which opens her beauty to the morning beam; to that we shall transfer the admiration of which this faded one is no longer worthy.” What a pang to the heart of Eve in these words! Love shall remain though beauty fade, but it shall be transferred; can it be so with her? She feels that she is not as the flowers of the field; deep thoughts enter her mind, bearing with them the first glimpse of that hereafter, the belief in which, although vague and formless, has been held by man in all ages.

Sir Thomas Browne suggests that the love of nature and of gardening was perpetuated through the descendants of our first parents to Noah, the first planter of the renewed world; from which point it may not be

uninteresting to trace the history of ornamental gardening and planting to the present day, when our most successful efforts appear to realize Milton's picture of Eden, rather than Sir Thomas Browne's interpretation of the word, an “enclosed field.”

Abraham planted a grove in Beersheba; Moses gives precise directions for the management of the vine; Solomon was wise in the knowledge of plants. The gardens of Babylon were, doubtless, wonders of grandeur in that country, naturally so bare of trees; they were a tribute of love from Nebuchadnezzar to his Median Queen, who pined for the groves of her native land. Sir C. Rich found one tree among the ruins; an evergreen resembling the *lignum vita*, and not indigenous there. This the Mahometans revere, saying that Ali tied his horse to it at the battle of Hilleh. Babylon became a park for those kings of Persia who succeeded to its ruins after the destruction of the Parthian empire, to keep their wild beasts in. The Persians had gardens from the time of their first king, Mahabad; and Cyrus considered them indispensable appendages of his residences. Sir Thomas Browne, in his “Garden of Cyrus,” says, “that monarch planted his vines and trees in straight lines, parallel, or crossing each other, in imitation of soldiers led to battle,” and that the custom was the same in India; according to Figueroa, who was ambassador from the court of Spain to that of Persia, 1617, the royal gardens at Shiraz had this uniformity in modern times. Homer's description of the gardens of Alcinoüs is well known; in speaking of those of Laertes, he says,

“The squadron'd vineyards well thy art declare,
The olive green, blue fig, and pendant pear.”

Did the peaceful art of planting indeed imitate the royal game of war? These lines of Homer show that the fruits mentioned were then common in Greece, though neither the olive nor pear were indigenous there. Vertumnus may be a wholly fabulous personage; if so, we have the stronger reason to conclude that the arts of planting, pruning, and grafting, were practised at a very early period. Hebe, the wife of Bacchus, may be merely the personification of an attribute too refined for the apprehension of the multitude; but the tradition that she taught her subjects the method of transplanting trees, and of forming flower beds, shows the remote antiquity of these arts. The Greeks were great lovers of nature; that they early understood the management of the olive is known by their legend of Minerva, probably the Neith of Egypt. The “fair clustering” narcissus, and the “gold gleaming” crocus were reckoned among the glories of Attica; the latter flower was, probably, brought from Ionia with the violet, which was so carefully cultivated as to be brought in profusion to the Athenian markets when snow was lying on the ground; roses also were in great favour. Plutarch describes the garden of Academus in his life of Cimon, its planter.

The wealthy and luxurious Romans seem to have followed the fashion of earlier nations in laying out their gardens, which were walks between clipped trees bordered by aromatic herbs and flowers, and ornamented by fountains and alcoves, very much in the style which was prevalent in England during the reign of William the Third. The immense towers, artificial sheets of water, and as artificial mountains, which we read of in the gardens of Lucullus, Nero, and others, could not, of course, be imitated by the common people; hence, perhaps, a Roman garden was usually merely a place for the cultivation of such fruits, herbs, and flowers, as were required for domestic purposes. Virgil says, that, had he written of Horticulture, he would not have forgotten the narcissus, the acanthus, the ivy, the myrtle, or the rose gardens of Præstum. Cæsar left his gardens to the Roman people, and they were further beautified by Augustus.

Towards the end of the first century the prevailing taste was to have *clipped box* among myrtles and other plants; cypress trees thus transformed appear in the

paintings found at Herculaneum. In the account of his Tuscan villa, after describing the Hippodrome, which was surrounded by trees, Pliny thus speaks of his garden:—

"Having passed through these several winding alleys, you enter a straight walk, which breaks out into a variety of others, divided off by box hedges. In one place you have a little meadow; in another the box is cut into a thousand different forms; sometimes into letters expressing the name of the master, sometimes that of the artificer." He then describes a bench "from which water gushes into a stone cistern; and a marble basin of water which serves for a table, the larger supper dishes being placed round the margin, while the smaller ones swim about in the form of little vessels and water-fowl." This is fanciful enough, and less displeasing than the clipped trees. The rose was the favourite shrub with the Romans, and its early flowers were in such request for garlands as to be procured from Egypt, where the warmer climate produced them earlier, till the Roman gardeners found a method of forcing them by plates of talc placed over the bushes, and watering with warm water. Perhaps the roses of Egypt were particularly fine; Cleopatra is said to have paid upwards of 200*l.* for roses to decorate one supper. The Romans under Augustus carried their passion for flowers to such a degree, that it was found necessary to restrain it by sumptuary laws.

Having thus very briefly attempted to give a sketch of gardening up to the period of the greatest grandeur of Rome, we must pass over her decline and fall. The barbarian "came down like a wolf on the fold;" the arts of peace were extinguished; the domain of the noble was pillaged, the hut of the peasant destroyed. It was the third great disruption in the history of the world; the Cushite dispersion, the scattering abroad of the Jewish nation, and now the breaking up of the largest empire of antiquity. Soon a new power arose from the wreck of luxury and riches; ecclesiastical establishments, humble at first, grew by degrees to wealth and power but little inferior to those of the Roman emperors; men withdrew from the world to deserts which they rendered fertile, and to solitudes which they peopled with the humbler works of God. Sovereigns bestowed upon them lands and serfs, in return for prayers and indulgences; the convent flourished if the castle was destroyed; the shaven head walked the land in safety, while the crested helmet was brought low by treachery or assault. The monastery's sheltered bound was the only spot which war spared and rapine respected; the monks, gathered together in holy idleness from distant climes, brought with them the herbs, by aid of which they had been accustomed to perform the duty of healers of the sick; and the royal example of Mithridates, the first to cultivate medical plants, was unwittingly followed by many who had scarcely heard his royal name. The frequent pilgrimages which the monks undertook added to their store of useful herbs; and we may well imagine that the mendicant friars would proudly offer such treasures, in return for the necessities which they were forbidden by their rule to provide for themselves. At the same time, ornamental gardening was not likely to flourish; for though each secluded brother might delight in the trim-border and verdant turf of his place of recreation, all would avoid any display of elegance or wealth which could tempt the sacrilegious hand of his feudal neighbour. We read of vineyards and orchards in England under the Saxons, but know nothing of gardens. Charlemagne revived gardening in France, by commanding the formation of gardens throughout his dominions, and carefully selecting such plants as were most useful for diet and medicine, which he enjoined should be properly cultivated. Hence the art would probably be introduced into Britain with the Norman Conqueror, as William is called; and we find that Henry the First had a park at Woodstock. Extensive ruins, occupying nearly six acres, have been recently dug up on the Duke of Marlborough's estates, showing that a magnificent Roman villa had formerly

stood there, which, probably, our Henry appropriated to himself. During this period there are no distinct traces of the existence of gardens; the fever of monk-errantry (if we may coin a word) spread over Europe, and monarchs joined with Peter the Hermit in leading the infatuated flock to Palestine. There were deeper causes at work than the desire of rescuing the Holy Sepulchre, though the multitude knew them not; but good came forth of evil—many an useful herb and many a fragrant flower do we owe to the Crusades. One monk brought a single root of the saffron crocus in the hollow of his staff, which he gave to his monastery; it increased and spread, till it afforded an important article to the dyer. The earliest chartularies of abbies and monasteries speak of gardens and orchards, and probably our best fruits were brought into the island during the reign of the Norman and Plantagenet lines. With respect to private gardens, Fitz Stephen states that the citizens of London, in the reign of Henry the Second, had gardens to their villas, large, beautiful, and planted with trees. In the reign of Edward the First the cultivation of the garden was extended to the more curious and delicate plants. The young hero of royal romance, James the First of Scotland, in his poem of "The King's Quair," describes the garden of Windsor Castle, as thick set with trees, alleys of hawthorn hedges, and an arbour at each corner with "the sharpe, green, swete, juniper." Privacy, or perhaps safety, seems to have been the first object; and in these early times, when to venture beyond the walls which encompassed a baronial castle, would have been an act of temerity in the ladies of the domain, the garden appropriated to their use was defended by walls, as well for safety as for shelter; the space was not large, and there could be no great variety of surface or prospect; vegetables, fruits, and flowers were intermingled, and perhaps the former of these were the objects of most careful cultivation. Beyond the castle walls lay the *chase*, an important part of the feudal domain; here the lord and his retinue followed that amusement which was second only to the occupation of war in its excitement of the animal spirits; but of which the females rarely partook, hawking being their more frequent pastime.

During the following century the wars of the Roses devastated the land; brother fought against brother, father against son; trade was ruined, and the light of the arts was quenched in blood. Towards the end of the fifteenth century, Leland mentions *topiary-work*, that is, the cutting of trees into shapes, as much in fashion; the great Earl of Northumberland, whose household consisted of one hundred and sixty persons, "had but one gardener, who attended hourly in the garden, for setting of herbs and clipping of knots, and sweeping the said garden clean." In the reign of Henry the Eighth, the royal gardens of Nonsuch were planted with shady walks, fountains, clipped trees, and pyramids; these ornaments prevailed till the time of Kent. The Reformation brought its benefits and its evils to the art of gardening; the hand of the spoiler came to the convent, its garden was broken up and demolished, or passed to some favourite who cared little beyond the revenues it produced. But its treasures were disseminated abroad; and to this arbitrary act of Henry, we perhaps owe the general culture of many of those vegetables which were supposed to be brought from Holland in his reign, but which may have existed for centuries in the monastic establishments. During the reign of Elizabeth, an Italian, calling himself Melissus, published a volume of Latin poems in English; in one of them, "On the Royal Garden," a labyrinth is described, and the Queen is mentioned as fond of flowers. James the First improved the gardens at Theobalds, which had been made by Lord Burleigh; and Mandelst, writing in 1640, describes them as a large square, the walls covered with *fillery* (trellis work), and a beautiful *jet d'eau* in the centre; he also mentions *espaliers*. The gardens of this time corresponded in style with the mansion.

Square box windows profusely ornamented, looked out upon terraces decorated with arms, statues, and balustrades; and the prevalent taste seems to have been a combination of the grand and the ornamental. "The tricks of water-works to wet the unwary, and parterres embroidered in patterns like a petticoat," were but the childish endeavours of false taste. Lord Orford truly says, "the compass and square were of more use in plantations than the nurseryman."

Lord Bacon has given us his idea of a noble garden; one feature is, "in the very middle a fair mount, with three ascents and alleys, enough for four to walk abreast, which I would have to be perfect circles, without any bulwarks or embossments; and the whole mount to be thirty feet high, and some fine banqueting house, with some chimnies neatly cast, and without too much glass." He also describes "fair columns upon frames of carpenters' work," to be cut in "juniper, or other garden stuff," but he does not like *images* cut in like manner: nor knots with "divers coloured earths—they be but toys." Lord Bacon was not the first English writer on gardening; Arnold's Chronicle, 1521, treats of the planting and grafting of fruits; and Tusser gives some "approved lessons on hops and gardening," 1537. The "Gardener's Labyrinth" was also published in the reign of Elizabeth; it contains plates of "Knotts and mazes, cunningly handled, for the beautifying of gardens."

Charles the First brought over Tradescant, a Dutchman, to be his kitchen gardener, and appointed Parkinson, the author of "Paradisus Terrestris," a work on Horticulture and flower gardens, to be his *Herbarist*, or royal botanist, a place created for him. Cromwell promoted agriculture more than gardening; that is, he saw the state of desolation to which civil war with its attendant miseries had reduced the land, and, the ancient nobility being impoverished or exiled, he found that his best policy lay in encouraging the yeomanry and gentry to re-cultivate the devastated lands. Cromwell did much both for the external and internal resources of the country; he pensioned Hartlib, a Lithuanian, who had studied in Flanders, and who first recommended to notice "the two grand secrets of Flemish husbandry," that of letting farms on improving leases, and cultivating green crops. Hartlib was the friend of Milton, and the poet dedicated his Essay on Education to him. The pension which Cromwell had given was lost under Charles the Second, and Hartlib died in poverty. This writer says, "some old men recollect the first gardener who came into Surrey to plant vegetables."

Charles the Second planted the lime trees and dug the canal in St. James's Park, where he had birds kept in cages, whence the name Bird-cage Walk; he had also the Mall paved with cockle shells for the game of mail; and stocked the canal with water-fowl, which he fed himself. Rose, the gardener to Lord Essex, who had passed some time in Holland, then the best school of horticulture, and had also studied under Quintiney, at Paris, was appointed royal gardener by Charles, who likewise sent for Le Notre, purposely to plant St. James's and Greenwich parks. When Quintiney came to England to visit Evelyn, the king offered him a pension to reside here; but he declined it. Quintiney had been educated for the church; but having a decided preference for gardening, he turned his whole attention that way. The entire direction of the royal gardens of France was given to him; and when he died in 1701, at Paris, Louis XIV. assured his widow that "he was an equal sufferer with herself." Evelyn translated Quintiney's work "On Orange Trees," and his "Complete Gardener," and wrote his own "Kalendarium Hortense," in 1664. His last work on gardening, the "Acetaria," was not published till 1699. Evelyn also patronised many useful works on horticulture; among others, the translation of Arnaud d'Audilly's "Essay on Fruit Trees," an excellent practical work, and remarkable as being the first to censure the fashionable absurdity of clipping trees into the form of animals, &c. Lord Capel also

was an eminent encourager of gardening; having brought over with him from France many new fruits, he planted them at Kew. Lord W. Russell laid out the garden in Bloomsbury Square, and planted the acacias there, at this time. The following is a description of an Italian garden of this period, in Evelyn's words.

"The gardens are delicious, and full of fountains. In the grove sits Pan feeding his flock, the water making a melodious sound through his pipe; the club of Hercules yields a shower of water falling into a great shell in which there is a woman riding on the backs of dolphins. In another grotto is Vulcan and his family, the walls richly composed of corals, shells, copper and marble figures, with the hunting of several beasts, moving by the force of water. Here, having been well washed for our curiosity, we went down a large walk, at the sides whereof several slender streams of water gush out of pipes concealed underneath, that interchangeably fall into each other's channels, making a lofty and perfect arch, so that a man on horseback may ride under it, and not receive one drop of wet. This canopy or arch of water I thought one of the most surprising magnificences I had ever seen, and very refreshing in the heat of summer. At the end of this very long walk stands a woman in white marble, in position of a laundress wringing water out of a piece of linen, very naturally formed, into a vast laver, the work and invention of M. Angelo Buonarrotti."

Thus our English style was not more absurd than that of the continent, of which, perhaps, it was a copy; for Charles the Second was not only of foreign education, but his personal habits were foreign, his tastes were foreign,—and, it may be feared, his vices were foreign. Grandeur of design was strangely combined with littleness of execution, in the style of gardening prevalent during his reign and that of his successor. Charles had not the pecuniary resources of Louis the Fourteenth, or, perhaps, he would have imitated that monarch's creation at Versailles, which cost 200,000,000*l.* Mr. Barrington conjectures that hot-houses and ice-houses were first introduced in the reign of Charles the Second; but the account of the installation dinner, at Windsor, April, 1667, at which there were cherries, strawberries, and ice-creams, does not prove any of those to be newly-found luxuries; indeed, Switzer, a contemporary writer, mentions the above fruits as having been forced by dung-heat from time immemorial, by the London gardeners; and Lord Bacon plainly speaks of "housing our natives to forward them, as we house our exotics to protect them."

Luke and Field, gardeners to the Duke of Bedford; Cooke, gardener to Lord Essex; London, and Wise, were the practical gardeners of this time; the two latter had the first considerable nursery garden at Brompton, and laid out many gardens in the country—Blenheim, Cannons, Exton, and Longleat, in England, and Hatton House, near Edinburgh.

The short reign of James II. probably produced no alteration in the royal gardens; and we have no account of private improvements. The nation was otherwise occupied; shaken to its centre, and preparing for a second fearful struggle, we need but to open Burnet's history to see that there was ample groundwork laid for a tremendous national convulsion. But England was spared this; and we owe much of our domestic improvement, as well as our political stability to William and Mary. In their reign gates and rails of elaborate iron-work were introduced, as at Hampton Court; where the four urns in the front of the palace were perhaps the first ornaments of the kind in England, though common in Italy much earlier. Mary resided much at Hampton Court, and appointed Plukenet her herbarist, with a salary of 200*l.* per annum. In this reign botanists were sent to explore the Indies for plants. London, whom we have already mentioned, was superintendent of the royal gardens. Queen Anne was otherwise engaged than in gardening; but she completed the grounds at Kensington, which

were begun by William, under the direction of Wise. It is believed that George the First rather improved his garden at Herenhausen than those of any of his English palaces. But a new era of gardening arose in this reign with Philip Miller, curator of the Botanic garden at Chelsea, and author of the *Gardener's Dictionary*. He improved the culture of fruits, and from his time horticulture made great progress. Hitherto, green houses had not been roofed with glass; this improvement was introduced for the purpose of forcing fruits; and the great number of foreign plants annually brought hither rendered it necessary for gardeners to learn their structure and habits, in order to bring them to perfection; thus a spirit of improvement on scientific principles was generated.

In the succeeding reign Richmond gardens were much improved by Bridgman, who banished verdant sculpture, and even introduced glades and small forests between his walks, which, however, were still in the Dutch style. He broke away the brick walls which had hitherto encompassed the pleasure ground, and substituted the sunk fence. The garden at Houghton was one of the first specimens of the new taste; and Sir R. Walpole also much improved the gardens of Richmond Lodge, of which park he was ranger. The Queen being much pleased with his alterations, asked him how much it would cost to enclose St. James's Park, and make it as beautiful as Richmond? "Only three crowns, madam," was the minister's reply.

Our next improver is Kent, of whom Lord Orford says, "he leaped the fence, and found that all nature was a garden." Kent perceived that the formal, terraced, and yew-clipped garden assorted but ill with the park, now brought, by rasure of the walls, into the same view; and he endeavoured to make them agree, by giving to the park some of the refinement of the garden, and to the latter some of the simplicity of the country. Kent also ejected statues from the garden, but he crowded it with obelisks and temples. To Kent succeeded Browne, who formed the noble lake at Blenheim, which refreshes the eye the more from its contrast to the formal mansion. A lake is required there, and the depth and shadow of some parts of it add to the effect its vastness produces. The proper management of water seems to have been a great difficulty, even after the clipped hedge and high wall had been levelled. An anecdote told by Daines Barrington shows how difficult it was to overcome the prejudices in favour of straight canals and square ponds. Queen Caroline formed the water in Hyde Park by laying together several ponds, and it was called Serpentine because it was the first piece of ornamental water which was not perfectly straight. There is often much incongruity in the character of water; as a general rule, perhaps, we may observe that a natural river agrees best with an old mansion, and a lake with one of a more modern date; but it has been too much the custom to consider merely the nature of the ground, and where this was convenient to enlarge the river, it was done without regard to the character of the domain. Thus we have seen a large shallow lake which was literally fordable, where the natural river would have given a character of grandeur, now entirely lost.

We have carried our sketch of gardening down to the reign of George the Third. Since that period, so much has been done by wealth and taste towards rendering the parks of Britain living pictures of Milton's Paradise, and so universally has the love of nature been testified in the adornment of the baronial mansion, and the improvement of the suburban villa, that it is needless to pursue the subject farther. At the present moment there appears to be an effort towards admitting the artisan to a more free participation in the beauties of the park of his superior than used to be allowed; we trust the example will be followed, being certain that the feelings thus called forth are, in general cases, not those of envy, but of admiration and gratitude.

F. C. B.

OLD RECORDS OF NEW ROADS.

No. I.

TO ALL WRITERS AND READERS.

As the avowed purpose of railroads is to shorten all communications, I must only thus briefly return thanks to the many different authors, alive or dead, from whose works the following reminiscences are compiled.

A MODERN poet says:—

"Of time, there's no denying,
One half in how-d'ye-doing goes,
And t'other in good-bye'ing."

And certainly this may equally be said of railway travelling. Indeed, we can compare it to nothing but the flight of time, unless it be to the ubiquity of the far-famed bird of Sir B—— R——, that he averred was in two places at once.

The next train on the South-Western Railway is to convey me from London to Southampton in fewer hours than our ancestors took days to perform the same journey; for, though it is true that George the Third once went from Kew to Portsmouth in seven hours, the exploit was considered so wonderful at the time of its performance, that it was duly chronicled for the astonishment of posterity. Now the journey may be performed in one-third of the time. Nor can we suppose that improvements are yet at an end, or that the next generation will not despise the inventions of to-day, as we now condemn the customs of our forefathers.

It is well known, that though a species of coach was first introduced into England in the reign of Queen Elizabeth, yet her Majesty usually performed her progresses on horseback, and it was not till the reign of her successor that private coaches came into general use amongst the nobility. In the 22nd year of King James, (1625,) hackney coaches were set up in London, which stood ready at the inns, to be called as wanted; and apparently they must have speedily come into fashion, for one of the many ill-advised proclamations made by Charles the First in 1635, was one forbidding "the general and promiscuous use of hackney-coaches in London and Westminster or their suburbs, being not only a great disturbance to his Majesty, his dearest consort the queen, the nobility, and others of place and degree, in their passage through the streets,—but the streets themselves were so pestered, and pavement broke up, that the common passage is hereby hindered, and the prices of hay and corn exceedingly dear. Wherefore it is commanded and forbid that no hired coaches should be used in London, &c., except they be to travel three miles out of the same; and also that no person shall go in a coach in the said streets, except the owners of the coach shall constantly keep up favourable horses for our service when required."

In this proclamation allusion is made to a few public coaches that had then recently been established by some private individuals who agreed to convey passengers from one town to another, in large cumbrous vehicles without springs, that were so designated. But their mis-called expeditions were always performed with caution and solemnity; the horses being seldom, if ever, allowed to indulge in a trot. Regular stage-coaches were not established till the reign of George the Second, (1744,) and at first there were no more than six kept constantly at work in all England; but, small as that number was, and slow as their rate of travelling now appears, this change of conveyance made a considerable alteration in the habits of the middle ranks, for a writer of that period observes:—

"These stage-coaches make gentlemen come to London on very small occasions, which otherwise they would not do but upon urgent necessity; nay, the convenience of the passage makes their wives often come up, who, rather than come such long journeys on horseback, would stay at home; here, when they come to town, they must

presently be in the mode—get fine clothes—go to plays and treats, and by these means get such a habit of idleness and love of pleasure, that they are uneasy ever after."

Notwithstanding these prudent observations of Mr. John Cresset, of the Charter House, stage-coaches increased in popularity, and came into general use in the beginning of George the Third's reign, (1762.) Their rate of travelling then also improved, as the journey from London to Oxford was usually performed in three days, though it still took four to bring the "long Salisbury" to the capital. Passengers usually made their wills before undertaking a journey, and pistols and eatables were considered as indispensable as any other description of luggage. Even so late as eighty years ago the privileges of persons who confided the custody of their lives and properties to the proprietors of stage coaches, seemed to have been but little understood; for a cause was then tried (1770) in the Court of Common Pleas on the complaint of certain passengers travelling by one of these stages who refused to dine at a "hedge alehouse," as the coachman wished to compel them to do; and, on the contrary, went to an inn at Epsom, where they desired him to call for them, as he must pass the house. Instead of doing so he drove by at full speed, and left them to find their way to London as they could; for which conduct the jury fined the proprietor of the coach in twenty pounds damages.

Nor does it appear that there were then any restrictions as to the number of passengers or weight of baggage, for the Annual Register for 1770 mentions there having been thirty-four people in and on the Hertford stage, when, on the 6th September, in that year, it broke down from being overloaded. One man was killed on the spot, two women broke their legs, and very few of the whole number escaped severe injuries.

Whilst the personal inconveniences of travelling were thus slowly ameliorating, talent and science were beginning to be directed towards improvement in the transportation of merchandize. So early as the first year of Charles II., a Mr. Beaumont gave, at Newcastle-upon-Tyne, a series of experiments on the exploration of coal-mines and the conveyance of their contents by carriages of a new construction. These experiments failed, and as is usually the case, the projector was ruined. But it is, nevertheless, acknowledged that this Mr. Beaumont was the originator of railroads. He was of the same family as Francis Beaumont, the poet who wrote in conjunction with Mr. Fletcher, in that reign. The experimentalist above alluded to appears to have been Joseph Beaumont, who was born at Hadleigh, in Suffolk, in 1615, and educated at Peter's House, Cambridge, where he obtained a fellowship, of which he was deprived for his loyalty, during the civil war. Soon after the Restoration he recovered his preferments, was made chaplain in ordinary to the King, master of Jesus College, Cambridge, and subsequently removed to Peter's House, where he died (1696) at the advanced age of 84.

Previous to his death, something similar to the railroad now used (1676) were applied to the conveyance of coals, as, within thirty years after the lectures at Newcastle, there were laid wooden rails in parallel lines from the mouth of several coalpits in the vicinity of the river Tyne, which were projected to it, and on them were placed carriages, with rollers adapted to the rails, by which means one horse could draw five chaldrons of coals without difficulty.

It does not appear that any improvements were made in these railroads for many years, although they were in general use through all the mining districts. But about a century after their invention, (1760,) iron plates were first used to cover them, at Colebrookdale in Shropshire, (where also the first iron bridge was tried,) and in a short time the wooden rails were superseded first by wrought and then by cast-iron ones. Finally, these rail, or tram-roads were laid on inclined planes, and windlasses and pulleys were placed

at the upper end of them to draw the coal carriages backwards and forwards without the aid of horses.

Here invention paused. These contrivances were universally applauded and generally adopted. Derbyshire and Leicestershire set the example, and so rapid was their extension that, in the year 1811, there were no less than one hundred and fifty miles of iron railroads in full operation, in the comparatively small district of South Wales alone.

The obvious advantage of this method of conveyance suggested the idea of substituting iron railroads for the roads in general use, and in 1800, Doctor Anderson published his "Recreations in Agriculture," which contained a plan for their adoption throughout the whole country. He proposed that iron railways should be carried along the sides of the existing turnpike roads, and even gave minute directions for their formation, with bridges, viaducts, short-tunnels, and most of the other arrangements now in use, with the exception of the motive power, which was then unthought of, the design of these railroads being only to ease the draught of horses, not as a substitute for their employment.

Meantime a power, then in embryo, was awakening into life, to which no limit can even yet be assigned. The application of steam to the aid of mechanism forms an era in the history of mankind. Its giant force, chained by the omnipotence of man, gives man a sovereignty over nature, that wants but immortality to raise him above this sphere. Nor is the flexibility of steam less wonderful than its force, for it has been well compared to the trunk of an elephant, that can pick up a pin or rend an oak with equal facility.

The power of steam has by many been supposed to be one of the wonderful discoveries made by Archimedes, who flourished about two hundred and fifty years before Christ, and so effectually benefited the Greeks in their memorable contest with the Romans at the siege of Syracuse. Amongst the moderns, Muschenbroeck, a German, was amongst the first who wrote on the theory of steam; and Otto Guericke, of Hamburg, invented the air pump about the time that Lord Worcester gave to the world the first notice of a steam-engine, contained in his "Century of Inventions" published in the beginning of the reign of Charles II. Though even he is supposed to have taken the idea of it from the ravings of a madman, then confined in a lunatic asylum at Paris for having asserted that he could make what are now denominated steam-boats.

This Lord Worcester, (who has sometimes been confounded with his ancestor, John Earl of Worcester, the translator of "Cicero," in the reign of Edward IV.) the author of the "Century," was one of the most extraordinary characters mentioned in history. Hume depreciates his political talents, which, nevertheless, procured for him from Charles I. a patent appointing him generalissimo of three armies, and admiral; giving him power to raise money by selling his Majesty's woods, ward-shires, customs and prerogatives; and as if these extraordinary powers were insufficient, further delegating to him authority to create by blank patents titles of nobility from the rank of marquis to a baronet. Of his mechanical genius Lord Orford speaks in terms of the utmost contempt, and calls his "Century" "an amazing piece of folly," and yet this scantling of inventions, contained in embryo many of those which now form the boast and wonder of modern philosophy, among which that of the steam-engine stands pre-eminent.

This leviathan of mechanism, the importance of which was so little understood, even by the inventor, soon attracted the attention of the learned of all countries. England, however, still kept the lead, and in the sixth year after Charles the Second's restoration, a Captain Savory obtained a patent for his improvement on Lord Worcester's steam-engine.

Thus, whilst civil strife disturbed the Commonwealth, and immorality and licentiousness disgraced the court, literature and the arts were supported both by the prac-

tice and patronage of the nobility; and it is a curious fact, that some of the most valuable discoveries in science have been made, not when peace gave leisure for meditation and research, but at those periods when the greatest convulsions agitated the political world. Perhaps it may be accounted for in a similarity of cause, which, producing general mental excitement, gave equal impetus to each different branch of talent by which individuals are distinguished.

Whilst Alexander the Great was extending his conquests over the principal part of the then habitable world, he was attended in his march to victory by a train of philosophers and artists that formed a galaxy of intellectual light. His copyist, Bonaparte, rendered his dynasty as remarkable for the successful impulse given by him to science and literature, as for his own abortive attempts to gain universal sovereignty. And in like manner, many useful discoveries were made during the turbulent times preceding the restoration of Charles the Second, at which period the Royal Society of England took its rise.

During the height of the civil wars, (1645,) and about four years previous to the date of Mr. Beaumont's lectures, already mentioned, a certain number of learned men agreed to hold private meetings, first in London and afterwards at Oxford, for the purpose of investigating subjects of natural knowledge during the suspension of academical pursuits, occasioned by the distracted state of the country. Lord Worcester does not appear to have been of the number, as at that time he was actively engaged in the royal cause. But many other men of celebrity were members, amongst whom are the names of Boyle, Loden, Ward, and Wilkins, the latter of whom, though brother-in-law to Oliver Cromwell, was afterwards made Bishop of Chester.

At first they styled themselves the philosophic college, but at the Restoration they were incorporated as "The Royal Society." William Lord Brouncker was their first president, and some of his writings on mathematical subjects are still preserved in the Philosophical Transactions. He was succeeded in the chair by Sir Isaac Newton, and to this day the society has maintained its celebrity.

One of the many foreigners who sought admittance into the Royal Society of England, was a Frenchman, by name Papin, who, about the time Captain Savory obtained his patent for a steam-engine, (1665,) invented a digester, and made many experiments on the elastic power of steam. After he left England, and settled as professor of mathematics at Marspurgh, he even went so far as to apply it to mechanics, under the patronage of Charles, Landgrave of Hesse, in consequence of which, the French, to this day, give Papin credit for the invention of the steam-engine. Another competitor for that honour is Newcomen—a contemporary both of Papin and of Savory. But, however the invention of the steam-engine may be a subject of dispute, no doubt exists that the perfection of this extraordinary machine is entirely owing to the perseverance and ability of James Watt.

This highly talented man was the son of a tradesman at Greenock, where he was born in the beginning of the reign of George II. (1736.) He soon became a mathematical instrument maker; and at the age of twenty-one (1757) he was appointed in that capacity to the University of Glasgow, with apartments in the College, where he resided six years, when he married and established himself in a shop in that city (1764), and there he first made his wonderful improvements of the steam-engine.

From that time he devoted himself to the profession of civil engineer. He laid out many of the canals in the north of England, and invented a necrometer, and also a machine for drawing in perspective. In 1774 he removed from Glasgow to Soho, near Birmingham, where he entered into partnership with Mr. Boulton for the construction of steam-engines, which they conjointly carried to the highest perfection. Many European

potentates sent them complimentary testimonies to their abilities, amongst which those of Catherine II., Empress of Russia, were pre-eminent. Mr. Watt also invented the polygraphic machine, for copying paintings and manuscripts. He was elected a member of the Royal Societies both of London and Edinburgh, and created doctor of laws by the University of Glasgow; and thus, having enjoyed the singular good fortune of seeing his talents and discoveries justly appreciated during his lifetime, he died, August 28th, 1819, universally respected, at the patriarchal age of eighty-three.

The improvements of the steam-engine, thus perfected by Watt, suddenly produced almost incredible effects in the commercial world. Not only were manufactures essentially benefited, but the transportation of merchandise was proportionably accelerated. About thirteen years after the establishment of the Soho manufactory, (1787,) Mr. Miller, of Dalswinton, published a project for a steam-boat; and about the same time, Symington, a workman in his employment, exhibited a model of a steam-engine applied to propel a carriage. But this idea seemed to lie dormant till, in 1802, Mr. Edgeworth wrote an essay, suggesting that several stationary steam-engines should be placed at given distances on railways, for the purpose of drawing carriages along them by means of circulating chains.

A variety of attempts were made simultaneously to construct steam carriages to travel on turnpike roads, and different patents granted to individuals for their successive improvements; and at last (1815) Mr. George Stephenson obtained one for a locomotive, evidently above all its competitors, and from that time the progress towards perfection was rapid. Six years afterwards (1821) an act passed for making the first of the modern railways from Darlington to Stockton, which was opened in four years (1825), under Mr. Stephenson's direction, though his locomotives were not employed on it till the following year—the railway carriages, each containing twenty-six passengers, being at first drawn by one horse at the rate of ten miles an hour (1826). That year another act was passed for incorporating the Manchester and Liverpool Railway Company; but, though Mr. Stephenson was their engineer, the locomotives were still considered a visionary speculation, till, at the end of three years (1829), four different engines were tried together, the united advantages of railroads and locomotives were fairly established, and the railroad, as now used, was opened to the public, 15th September, 1830.

But whilst these competitions were going on, and locomotives on rails, and locomotives on turnpikes, were in full rivalry, the subject was brought before Parliament, and the concentrated wisdom of the nation was for some time occupied in ascertaining how many footfalls of a horse are made in an hour—as a data from whence to calculate the injury which locomotives would do to his Majesty's highways, if propelled on them, instead of on railroads. Nor is this the only instance of learned bodies directing their attention to the subject of horse-shoes; for, in the third volume of the *Archæologia*, is a learned dissertation on the antiquity of their use.

Without entering into the question as to whether the Emperor Nero's mules were really shod with gold, and those of his wife Poppæa were shod with silver, or whether both were contented to use shoes made of a kind of bronze, tinted and gilt, it is sufficient for the present purpose to know that here, in England, they began to shoe horses soon after the Norman Conquest. William I. gave to Simon St. Lizl, a noble Norman, the town of Northampton, then valued at £40 a-year, to provide shoes for his horses; and Henry de Ferres, or Ferrers, who came in with the Conqueror, took his name from his employment of shoeing—not that he was himself a shoer of horses, a *farrier*, but as appointed to direct or superintend that business; and

when, after the Crusades, it became the custom for families to take coat-armour hereditarily, a charge of six horse-shoes sable, on a field argent, was adopted as the cognizance of that noble house—as at this day, the highest military dignity in all European armies, is designated by the French word for farrier, *marechale*.

How long these useful articles, yeilded horse-shoes, may be retained in common use, already seems problematical—as, if the use and popularity of railways increase in any degree proportionate to their recent progress in public favour, the day may come when antiquaries may grasp at old horse-shoes with more avidity than they are now seized upon by the credulous in Ireland, who nail them up in their cabins as preservatives from witchcraft. Already railway travelling seems to have superseded all other modes; and is this matter of surprise, when we consider the extraordinary advantages which they offer to the transport of merchandize?

The railway from Liverpool to Manchester is only thirty-three miles long; yet the amount of saving to the Manchester manufacturers, in the carriage by it of cotton alone, is estimated at £20,000 annually. Nor is this by any means incredible. Not long ago an individual went by this railroad from Liverpool to Manchester, where he purchased 150 tons of cotton, which he, in the same way, took back with him. Having immediately disposed of them, and more being required, he repeated his journey, and actually delivered the same evening his second cargo, of equal quantity, having travelled 132 miles in four different journeys, and bought, sold, and carried 300 tons of goods in twelve hours.

The facilities thus afforded to a comparatively humble individual strangely contrast with the impediments of travelling from which even our sovereigns suffered only two centuries ago (1661); for in the reign of Charles II. that monarch intended to have made a progress through the country, beginning at Worcester, but “that the want of ancient purveyance prevented him.” This “purveyance” consisted of certain rights of the crown, which, to modern calculation, seemed to deprive the subject of any disposal of his personal property. At the restoration, Charles II. commuted these rights for certain compositions. But a clause, in a subsequent act of parliament, expressed that, as the want of carriages would be very inconvenient to the king in his progresses and removals, the chief officer of His Majesty’s carriages was empowered to provide carts for his Majesty’s use, and all persons refusing to serve were made liable to a penalty. No horses or carriages were to travel more than a day’s journey, nor without pay of ready money, the rate being “to be set down by two justices of peace.”

And yet, as we have already seen—the discovery of the steam-engine had then been actually made, though the world was not then ready for its adoption for any practical benefit. At this time the Parliamentary Commissioners’ report states, that the extent of railroads in England on which locomotives are now impelled by steam-engines, is 2264 miles, and plans for projected railroads are now lodged with the Board of Trade to the amount of eight thousand additional miles. Such is the computation of to-day; but to-morrow may set all enumeration at defiance, for the changes in every thing that take place almost hourly in this age of velocity, seem to baffle all attempt to describe them. Hydra railroads rise in all directions; the projects of last month are superseded in this; and in this inundation of speculation and changes, the mind is thrown back into antiquity as on the only subject that is not evanescent. For we must not pause even on the wonders that have already been effected. Doctor Lardner calculates that “the circumference of the earth being 25,000 miles, if it were begirt by an iron railway, one ton weight would be drawn round it in six weeks by the mechanical power that resides in the third part of a ton of coals;” and yet he adds, “the state of physical science at the

present moment justifies the expectation that we are on the eve of mechanical discovery more important than any which has yet appeared. Philosophy already directs her finger at sources of inexhaustible power in the phenomena of electricity and magnetism. The steam-engine itself, with the gigantic powers conferred on it by the immortal Watt, will dwindle into insignificance in comparison with the hidden powers of nature still to be revealed.” Is not this proposition startling?—And yet is it as incredible as the locomotives and express-trains would have appeared to our great-grand-fathers?

Nevertheless, I repeat, there is nothing that we can compare to railway travelling. The uncouthly rapidity which annihilates time and space, and which thought itself alone exceeds; the awful speed, over which we, individually, have no control, whilst we voluntarily suspend all personal mobility or free agency; all these are so foreign to the habits of every-day life, that in being appended to a locomotive, we seem to change our state of existence; or rather, we submit to a figurative death, in which we at once plunge into futurity, whilst yet the past is clinging round us. Neighbours of one hour may the next be separated by uncounted distance;—new companions, new regions, are suddenly presented to our view—and we can scarcely breathe in our new position ere expectation merges in reality—and hope or fear—reflection or calculation, are, with the journey itself, at an end.

Rousseau somewhere observes on travelling, “that a man should begin by observing his fellow-creatures, and then if he has time he may take notice of inanimate objects.”—*If he has time!*—Why, before the most practised physiognomist has taken an inventory of the features of his fellow-passengers in a railway first-class carriage, there are no longer other inanimate objects left for him to notice. The various landscapes on his route have already flitted past him like the scenes of a magic-lantern. Places interesting to the historian or the antiquary are already beyond his ken; he has been borne past them—he knows not how—and at the end of his flight he may congratulate himself, if he ascertain that instead of being carried *under*, he has at least been whirled *over* the ground which tourists of the last century have made pilgrimages to visit.

Is there no remedy for this, almost the only disadvantage of railway travelling? Must we submit to this diminution of what constitutes the chief pleasure of rambling to those who journey for amusement or instruction? Rousseau said “that to derive benefit from travelling, it is not sufficient to ride post through the country, but that there are many people who will learn still less from travelling than from books;” and surely this observation proves an axiom, when we remember the number of people of tender optics and irritable nerves who are at this day afraid even to look out of the window of an express train. Cannot the visions conjured by memory, of the days that are gone, supply, in some degree, the objects thus withdrawn from the eye? Yes—I will anticipate my journey by a tour round my book-shelves, and make, at my leisure, a catalogue *raisonné* of what we ought to be familiar with, even in that enchanted locomotive—

“Where nothing is, and all things *seem*,”

although, in doing so, I verify the description of an antiquary, drawn by the author of *Hudibras*, two hundred years ago, as one “whose days were spent and gone long before he came into the world;” and as “all his contemplations look backward on the days of old, his brains are turned with them as if he walked backwards.”

POPULAR YEAR-BOOK.

July.

THIS is the seventh month of the year. It was originally the fifth in the Roman Kalendar, and accordingly named *Quintilis*, to denote that numerical position, till Mark Antony denominated it July in honour of his illustrious friend and patron, Caius Cesar, whose surname was Julius. "This month," says Brady, "he selected for such honorary distinction, when the sun was generally most potent, the more effectually to denote that Julius was the emperor of the world, and therefore the appropriate leader of one half of the year."

July was anciently dedicated to Jupiter. The Saxons called it *hen-monat*, or foliage month; also, *hey-monat*, "because therein they usually mowed, and made their hay-harvest:" and *maed-monat*, from the meads being then in their bloom. It is represented as a strong, robust man, (eating cherries, or other red fruit,) with a swarthy sun-burnt face and hands; clothed in a jacket of a light yellow colour, wearing on his head a garland of centaury and thyme; bearing a scythe on his shoulder, and attended by a lion, in token that the sun enters that constellation on the twenty-third of this month. Spenser's delineation of July is perhaps more poetical than the above. It is as follows:—

"Then came hot July, boiling like to fire,
That all his garments he had cast away;
Upon a lion raging yet with ire
He boldly rode, and made him to obey:
(It was the beast that whilom did foray
The Nemean forest, till the Amphitritonide
Him slew, and with his hide did he array:)
Behind his back a scythe, and by his side,
Under his belt he bore a sickle circling wide."

July is the hottest month of the twelve. The direct influence of the sun, indeed, is continually diminishing after the summer solstice; but the earth and air have been so thoroughly heated, that the warmth which they retain more than compensates, for a time, the diminution of the solar rays. There is a sense of sultriness and of quiet all over nature. The birds, with but a few exceptions, are silent. The little brooks are dried up. The ground is chapped with parching. The shadows of the trees are particularly grateful, heavy, and still. The oaks, which are freshest because latest in leaf, "form noble clumpy canopies, looking, as you lie under them, of a strong and emulous green against the blue sky." The traveller delights to cut across the country through the fields and leafy lanes, where, nevertheless, the flints sparkle with heat. The cattle seek the shade or plunge in the pools and streams.

"On the grassy banks
Some ruminating lie, while others stand
Half in the flood, and often bending sip
The circling surface. In the middle droops
The strong laborious ox, of honest front,
Which incomposed he shakes; and from his sides,
The troublous insect lashes with his tail,
Returning still."

The excessive heat causes such an evaporation from the surface of the earth and water, that, after some continuance of dry weather, large heavy clouds are formed, which at length let fall their collected moisture in extremely copious showers. These summer storms frequently beat down the full-grown corn, and deluge the country with sudden floods, and are often accompanied by thunder and lightning.

Swallows, swifts, and martens, now generally flock together, preparatory to their migration, and towards the end of the month the cuckoo departs. Those birds sing only which breed late. The young of the earlier broods begin to warble in a soft tone. The quail calls. Young partridges are found among the corn. Poultry moult, or change their feathers; but smaller birds, as linnets, &c., do not lose their plumage so soon; but all renew it

before winter, when they are in their finest and warmest clothing. Many fish are in season, and the salmon is caught in numbers in Scotland and the north of England. Mackerel abound, and about the middle of July pilchards appear in shoals off the coasts of Cornwall.

More insects are seen in this month than in any other part of the year. Gnats, flies, beetles, frogs, and other reptiles, swarm in houses, gardens, and fields. The trees are full of fern-chaffers, and the fern-owl, or goat-sucker, may often be descried in the evening, wheeling round, and darting among the branches in search of them. Bees now drive away or kill the drones; and male and female ants are expelled from their nests by the workers. The females lay their eggs in the ground—these are hatched before winter, when the mother dies, and the other ants become torpid.

The hay harvest is generally ended in this month. Flax and hemp are pulled. The stalks of both are full of tough fibres or strings, which, separated and prepared in a particular manner, become fit for spinning into thread. Of flax, linen is made, from the finest cambric to the coarsest canvass. Hemp is chiefly used for coarse cloth, such as strong sheeting and sacking, but it is sometimes wrought to considerable fineness, and also twisted into ropes and cables. The rye is yellow and almost ready for the sickle. The wheat and barley are of a dull green, from their swelling ears being alone visible as they bow before every breeze that blows over them. The oats are rapidly ripening, "and quiver, each individual grain on its light stem, as they hang like rain-drops in the air." Gooseberries, raspberries, strawberries, currants, and cherries are in perfection. The flowers of June lose their beauty, shrivel, and fade; but many plants do not bloom till July, particularly the aromatic, the succulent, or thick-leaved, several of the aquatic, and of those in which many florets are collected into one head, as thistle, sow-thistle, hawk-weed, &c. The additional trees and shrubs in blossom are bramble, button-wood, itcas, cistuses, climbers, and broom. On the high downs "all the little mole-hills are purple with the flowers of the wild thyme, which exhales its rich aromatic odour as it is pressed by the feet." The great water-lily floats on the surface of the stream "like some fairy vessel at anchor, and spreading wide upon the water its pointed petals, offers its whole heart to the enamoured sun." The hemlock, wild clematis, centaury, (with its elegant cluster of small, pink, star-like flowers,) pimpernel, cockel, blue-bell, and convolvuses, beautify the fields and hedges. Nasturtiums, pinks, hollyhocks, lilies, sun-flowers, china-asters, lupines, columbines, veronicas, tuberoses, yellow roses, French marygolds, lavateras, London-pride, mignonette, &c., enliven the gardens. The farmer is principally occupied in gathering the productions of the earth into his garners; "dairy-cares" continue; field-peas are gathered for market; hops and trees pruned; turnips and potatoes hoed; grass must be mown; bulbous-rooted flowers, that have almost done with their leaves, should be taken up, and deposited in shallow wooden boxes. Mignonette should be transplanted into small pots, carnations be well attended to and supported, and auriculas kept clean from dead leaves and weeds, and frequently watered.

In the Alban Kalendar, July had thirty-six days. Romulus reduced it to thirty-one; Numa to thirty; but Julius Cesar restored the day of which Numa had deprived it, which it has ever since retained.

July 1.—In the statistical account of Scotland, we read that "St. Serf was considered as the tutelar saint of the parish of Culcross, Orkney," in honour of whom there was an annual procession on his day, viz. first of July, early in the morning of which, all the inhabitants, men and women, young and old, assembled and carried green branches through the town, decking the public places with flowers, and spent the rest of the day in festivity." We are informed that the procession is still continued.

July 3. This, according to the Almanack, is the first of the Canicular, or Dog-Days. The ancient me-

thod of calculating them was from the heliacal rising of Sirius, the brightest star in the constellation called Canis Major; or when that star first appeared, after having been hid by the solar beams. "If such rule," says Brady, "were still adhered to, the Dog-Days would not take place in our latitude until near the end of August, and would consequently last until the end of September; but if, as is contended, these days are calculated to begin from the period when the sun comes in conjunction with Sirius, and to last while its luminous rays obscure that star, their commencement and termination [on the 11th of August] are correctly placed in the Almanacks of the present period; though we must, of course, no longer agree with the ancients, that the Dog-Days are those commencing from the heliacal rising of Sirius, or when he first disengages himself from the rays of the sun, as hath, almost generally, heretofore been understood, but must date their beginning and duration from the cosmical rising of Sirius, or, in other words, when it rises with the sun." When the ancients could first behold Sirius with the naked eye, they usually sacrificed a brown dog to appease its rage; considering that this star was the cause of the hot sultry weather, usually attendant on its appearance; and that, on the morning of its first rising, the sea boiled, wine turned sour, dogs grew mad, and all other creatures became languid; and man afflicted, among other diseases, with burning fevers, hysterics, and phrenesies. At Argos, a festival was held during the Dog-Days, called *Cynophantes*, from four Greek words, signifying, "from killing dogs;" it having been the practice to destroy every canine animal that was met with. The exaggerated effects of the rising of Sirius are now, however, known to be groundless; and the intenser heat usually felt during the Dog-Days, has been more philosophically accounted for.

The fourth of July is the Saturday before Old Midsummer Day, in the current year. On this Saturday, an ancient and remarkable custom was formerly observed at Puxton, Somersetshire, in reference to the allotment of two large pieces of common land, called East and West Dolemoors, which lie in the parishes of Congresbury, Week St. Lawrence, and Puxton. The several proprietors of the estates having any right in those moors, or their tenants, were summoned at a certain hour in the morning, by the ringing of one of the bells of Puxton church, to repair to the sacred edifice, in order to see the chain kept for the purpose of laying out Dolemoors, measured. The proper length of such chain was ascertained by fixing one end of it at the foot of the chancel arch, and extending it through the middle of the nave, to the foot of the arch of the west door under the tower, at each of which places marks were cut in the stones for that purpose. The chain was only eighteen yards in length, and, consequently, four yards shorter than the regular land-measuring chain. After the above ceremony had been properly performed, the parties repaired to the commons. Twenty-four apples were previously prepared, bearing the following marks, viz. five marks called "Pole-axes," four ditto "Crosses," two ditto "Dung-forks, or Dung-pikes," one ditto called "Four Oxen and a Mare," one ditto "Two Pits," one ditto "Three Pits," one ditto "Four Pits," one ditto "Five Pits," one ditto "Seven Pits," one "Horn," one "Hare's Tail," one "Duck's Nest," one "Oven," one "Shell," one "Evil," and one "Hand-reel." Each of the moors was divided into several portions, called furlongs, which were indicated by strong oak posts, placed at regular distances from each other, which posts were constantly kept up. After the apples were properly prepared, they were put into a hat, or bag; and certain persons, chosen for that purpose, began to measure with the chain before mentioned, and proceeded till they had measured off one acre of ground; at the end of which, the boy who carried the hat, or bag, took out one of the apples, and the mark which such apple bore, was immediately cut in the turf with a large

knife, which was somewhat in the shape of a scimeter, with its edge reversed. In this manner they proceeded, till the whole of the commons were laid out, and each proprietor knowing the mark and furlong which belonged to his estate, he took possession of his allotment, or allotments, accordingly, for the ensuing year. An adjournment then took place to the house of one of the overseers, when a certain number of acres, reserved for the payment of expenses, and called the "out-let, or out-drift," were let by inch of candle. During the time of letting, the whole party, (except the bidders,) were to keep silence, under the penalty of a shilling. When any one wished to bid, he named the price he would give, and immediately deposited a shilling on the table, where the candle stood. The next who bid also named his price, and deposited his shilling in like manner, and the first bidder was then to take up his shilling. The business of letting thus proceeded till the candle was burnt out, and the last bidder, prior to that event, was declared the tenant of the out-let, or out-drift, for the ensuing year.

Two overseers were annually elected from the proprietors, or their tenants. A quantity of strong ale, or brown stout, was allowed for the feast, or "revel;" also bread, butter, and cheese, pipes, and tobacco. Any reputable person, whose curiosity, or casual business, led him to Puxton on that day, was at liberty to share in the festivities; but he was expected, at his departure, to deposit one shilling with the overseer, by way of forfeit for his intrusion. The day was generally spent in sociality and mirth of a boisterous character; and it rarely happened but that some of the junior part of the company, under the influence of strong drink, engaged in pugilistic contests.

In the year 1779, an unsuccessful attempt was made to procure an Act of Parliament for allotting these moors, in perpetuity. The land, however, was enclosed and allotted in 1811; and the ancient mode of dividing it, and, consequently, "the revel," from that time discontinued.

ELLISE.¹

(FROM THE DANISH OF ANDERSEN.)

THERE was once upon a time a young woman so kind and sweet tempered that every person loved her. Among the rest, there was an old witch who lived near where she dwelt, and with whom she was a great favourite. One day this old witch told her she had a nice present to give her. "See," she said, "here is a barley-corn, which, however, is by no means of the same sort as those which grow in the farmer's field, or those we give to the fowls. Now you must plant this in a flower-pot, and then take care and see what happens."

"Thank you a thousand times," said the young woman. And, thereupon, she went straight home, and planted the barley-corn the witch had given her, in a flower-pot. Immediately there grew out of it a large handsome flower, but its leaves were all shut close as if they were buds.

"That is a most beautiful flower!" said the woman, while she bent down to kiss its red and yellow leaves; but scarcely had her lips pressed the flower, than it gave forth a loud sound and opened its cup. And now the woman was able to see that it was a regular tulip, and in the midst of the cup, down at the bottom, there sat a small and most lovely little maiden; her height was about one

(1) See Illustration, p. 145.

inch, and on that account the woman named her Ellise.

She made the little thing a cradle out of a walnut-shell, gave her a blue violet-leaf for a mattress, and a rose-leaf for a coverlid. In this cradle, Ellise slept at night time, and during the day she played upon the table. The woman had set a plate filled with water upon the table, which she surrounded with flowers, and the flower-stalks all rested on the edge of the water; on the water floated a large tulip-leaf, and upon the tulip-leaf sat the little Ellise, and sailed from one side of the plate to the other; and for this she used two white horse-hairs for oars. The whole effect was very charming, and Ellise could sing too, but with such a delicate little voice as we have never heard here.

One night as she lay in her bed, an ugly toad hopped in to her through the broken window pane. It was a large and very hideous toad; and it sprang at once upon the table, where Ellise lay asleep under the rose-leaf.

"That would be now a nice little wife for my son," said the toad, and seized, as she said it, the walnut-shell in her mouth, and hopped with it out through the window into the garden again.

Through the garden flowed a broad stream, but its banks were marshy, and among the marshes lived the toad and her son. Ha! how hideous the son was too; exactly like his mother he was, and all that he could say, when he saw the sweet little maiden in the walnut-shell, was "Koax! koax! breckke-ke!"

"Don't talk so loud," said the old one to him, "else you'll awake her, and then she might easily run away from us, for she is lighter than swans'-down. We will set her upon a large plant in the stream; that will be a whole island for her, and then she cannot run away from us; while we, down in the mud, will build the house for you two to live in."

In the stream there were innumerable large plants, which all seemed as if they floated on the water; the most distant one was, at the same time, the largest, and thither swam the old toad and set down the walnut-shell, with the little maiden upon it.

Early on the following morning the little Ellise awoke, and when she looked about her and saw where she was, that her new dwelling place was surrounded on all sides by water, and that there remained no possible way for her to reach land again, she began to weep most bitterly.

Meanwhile the old toad sat in the mud and adorned the building with reeds and yellow flowers, that it might be quite grand for her future daughter-in-law, and then, in company with her hideous son, swam to the little leaf-island where Ellise lay.

She now wanted to fetch her pretty little bed, that it might at once be placed in the new chamber, before Ellise herself was brought there. The old toad bent herself cautiously before her in the water, while she presented her son in these words,— "You see here my son who is to be your husband, and you two shall live together charmingly down in the mud."

"Koax! koax! breckke-ke!" was all that the bridegroom could find to say.

And, therewith, they both seized upon the beautiful little bed, and swam away with it; while Ellise sat alone upon the leaf and cried very much, for she did not like at all to live with the frightful toad,

much less have her odious son for her husband. Now the little fishes which swam about under the water, had seen the toad, and heard, moreover, perfectly well all that she said; they, therefore, raised their heads above water, that they might have a look at the beautiful little creature. No sooner had they seen her, than they were, one and all, quite moved by her beauty; and it seemed to them very hard, that such a sweet maiden should become the prey of an ugly toad. They assembled themselves, therefore, round about the green stalk from which grew the leaf whereon Ellise sat, and gnawed it with their teeth until it came in two, and then away floated Ellise and the leaf far, far away, where the toad could come no more.

And so sailed the little maiden by towns and villages, and when the birds upon the trees beheld her, they sang out—"Oh, what a lovely young girl!" But away, away floated the leaf always further and further. Ellise made quite a foreign journey upon it.

For some time a small white butterfly had hovered over her, and at last he set himself down on her leaf, because he was very much pleased with Ellise, and she too was very glad of the visit, for now the toad could not come near her, and the country through which she travelled was so beautiful. The sun shone so bright upon the water that it glittered like gold. And now the idea occurred to her to loosen her girdle, bind one end of it to the butterfly, the other on to the leaf; she did this and then she flew on much faster, and saw much more of the world than she would have done.

But, at last, there came by a cock-chaffer, who seized her with his long claws round her slender waist, and flew away with her to a tree, while on swam the leaf, and the butterfly was obliged to follow, for he could not come loose, so fast and firm had Ellise bound him.

Ah! how terrified was poor Ellise when the cock-chaffer carried her off to the tree. But her sorrow over the little butterfly was quite as great, for she knew he must certainly perish, unless by some good accident, he should chance to free himself from the green leaf. But all this made no impression upon the cock-chaffer, who set her upon a large leaf, gave her some honey to eat, and told her she was very charming, although not a bit like a chaffer. And now appeared all the other cock-chafers who dwelt upon this tree, who waited upon Ellise, and examined her from top to toe; while the young lady-chafers turned up their feelers and said, "She has only two legs! how very wretched that looks!" and added they, "she has no feelers whatever, and is as thin in the body as a human being! Ah! it's really hideous!" and all the young lady-cock-chafers cried out, "Ah! it's perfectly hideous!" And yet Ellise was so charming! and so felt the cock-chaffer; but at last, because all the lady-chafers thought her ugly he began to think so too, and resolved he would have nothing more to do with her; "she might go," he said, "wherever she liked," and with these words he flew with her to the ground, and set her upon a daisy. And now the poor little thing wept bitterly, to find herself so hideous, that not even a cock-chaffer would have any thing to do with her. But, notwithstanding this decisive opinion of the young lady-cock-chafers, Ellise was the loveliest, most elegant little creature in the world, as delicate and beautiful as a young rose-leaf.

The whole summer through the poor little maiden lived alone in the great forest; and she wove her-

self a bed out of fine grass, and hung it up to rock beneath a creeper, that it might not be blown away by the wind and rain; she plucked herself sweets out of the flowers, for food; and drank of the fresh dew, that fell every morning upon the grass. And so the summer and the autumn passed away. All the birds which had sung so sweetly to Ellise, left her and went away, the trees lost all their green, the flowers withered, and the great creeper which, until now, had been her shelter, shrivelled away to a bare yellow stalk. The poor little thing shivered with cold, for her clothes were now worn out, and her form was so tender and delicate that she certainly would perish with cold. It began also to snow, and every flake which touched her, was to her what a great heapfull would be to us, for her whole body was only one inch long.

Close beside the forest in which Ellise lay, there was a corn-field, but the corn had long since been reaped, and now, only the dry stubble rose above the earth; yet, for Ellise was this a great forest, and hither she came. So she reached the house of a field-mouse, which was formed of a little hole under the stubble. Here dwelt the field-mouse warm and comfortable, with her store-room full of food for the winter, and near at hand a pretty kitchen and eating-room. Poor Ellise stepped up to the door and begged for a little grain of barley, for she had tasted nothing for the whole day.

"You poor little wretch!" said the field-mouse, who was very kind hearted, "come in to my warm room and eat something." And when now she was much pleased with Ellise, she added, "you may if you like spend the winter here with me; but you must keep my house clean and neat, and tell me stories, for I am very fond of hearing stories."

Ellise did as the field-mouse wished, and, as a reward for her trouble, was made comfortable with her.

"Now we shall have a visit," said the field-mouse to her one day. "My neighbour is accustomed to pay me a visit every week. He is much richer than I am, for he has several beautiful rooms, and wears the most costly velvet coat. Now if you could only have him for your husband, you would be nicely provided for, but he does not see very sharply, that's one thing. Only you must tell him all the best stories you can think of."

But Ellise would hear nothing of it, for she could not endure the neighbour, for he was nothing more or less than a mole. He came, as was expected, to pay his respects to the field-mouse, and wore his handsome velvet coat as usual. The field-mouse said he was very rich, and very well informed, and that his house was twenty times larger than hers. Well informed he might be, but he could not endure the sunshine, or the flowers, and spoke contemptuously of both one and the other, although he had never seen either. Ellise was obliged to sing before him, and she sang the two songs.—"Chafers fly! the sun is shining!" and "The priest goes to the field." Then the mole became very much in love with her because of her beautiful voice, but he took good care not to show it, for he was a cautious sensible fellow.

Very lately he had made a long passage from his dwelling to that of his neighbour, and he gave permission to Ellise and the field-mouse to go in it, as often as they pleased; yet he begged of them not to be startled at the dead bird which lay at the entrance. It was certainly a bird lately dead, for

all the feathers were still upon him, it seemed to have been frozen exactly there where the mole had made the entrance of his passage.

(To be continued.)

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

It would seem as if a traditionary sense of Paradise and its delights, had, with the mass of our instincts, accompanied the transmission of the flesh from sire to son. Man is naturally fond of a garden, and, to a Christian it possesses a sacredness which throws a holiness over all its operations. In a garden, the first man was born, there he tasted (and no where else) purely innocent joy; and in a garden, too, was undergone the agony of Him that restored that bliss; there also was buried the Restorer; and there, in his own glorious person, announced the resurrection of the dead.—*Rectory of Valehead*.

The qualities which form the good soldier and the good priest, are much more nearly allied than the world is commonly disposed to think. One is in the flesh what the other is in the spirit; and the vigilance, the fortitude, the seizure of opportunities, the adaptation to circumstances, the winning of men's hearts, and the tongue of persuasion, which all will agree to be necessary to the perfect priest, few will assuredly deny to be as necessary to the accomplished soldier.—I learnt my best weapons in the house of peace. I thus became acquainted with the human heart; I could enter into the thoughts and feelings of rude uneducated men. I was acquainted with numberless little attentions and ways of winning good will, which it is too late to learn after the attainment of manhood, when the observation is not sufficiently curious or minute so as to discern them, nor temper flexible enough to employ. Thus I was instructed to deal with inferiors with kindness, and yet with dignity; and the men placed under my command, soon discovering my sympathy, were zealous to gratify me with the strictest obedience.—The soldier, no less than the man of peace, will do well to seek first the kingdom of God and his righteousness.—*Ibid*.

On the evening after this visit, (to the King of Persia,) my excellent friend whom I have before mentioned as preferring a shot at a duck to a view of the ruins of Persepolis, said he would like to be King of Persia. Knowing that inordinate ambition had no place in his mind, I asked him what he would do if he attained that station? "Run away with my crown," was the prompt answer. We had a hearty laugh at the genuine simplicity of this expression. It is, perhaps, the first time sovereignty was ever desired for such a purpose; but considering all that attends, in Persia, the wearing of the article he wished for, it would perhaps be the best mode of converting to real advantage so dangerous and precarious a possession.—*Sketches of Persia*.

CHERAGH ALI KHAN, when we were at Shiraz, dilated on our habits as much more cleanly than our Christian brethren of the north. "They delight in nothing," said he, "but strong liquor and hog's flesh; and, would you believe it," addressing himself to the Elchee, "they are so fond of the vile animal on which they live, that they actually tie their hair in a form which resembles its tail!" The Elchee looked as if incredulous of this last usage, though it was to my knowledge not more than a twelvemonth since his own head had been shorn of the ornament held in such abomination.—*Ibid*.

COLERIDGE'S HOUSE.

Poetry.

REFLECTIONS ON HAVING LEFT A PLACE OF RETIREMENT.

Low was our pretty cot: our tallest rose
Peep'd at the chamber-window. We could hear
At silent noon, and eve, and early morn,
The sea's faint murmur. In the open air
Our myrtles blossom'd; and across the porch
Thick jasmynes twined; the little landscape round
Was green and woody, and refresh'd the eye.
It was a spot which you might aptly call
The Valley of Seclusion! Once I saw
(Hallowing his sabbath-day by quietness)
A wealthy son of commerce saunter by,
Bristow's citizen: Methought it calld'd
His thirst of idle gold, and made him muse
With wiser feelings; for he paused and look'd
With a pleas'd sadness, and gazed all around,
Then eyed our cottage, and gazed round again,
And sigh'd, and said, it was a blessed place,
And we were bless'd. Oft with patient ear,
Long-listening to the viewless skylark's note,
(Viewless, or haply for a moment seen
Gleaming on sunny wing,) in whisper'd tones
I've said to the beloved, "Such, sweet girl!
The inobtrusive song of happiness—
Uncarthy minstrelsy! then only heard
When the soul seeks to hear; when all is hush'd,
And the heart listens."

But the time, when first
From that low dell, steep up the stony mount,
I climb'd, with perilous toil, and reach'd the top,
O what a goodly scene: Here the bleak mount,
The bare bleak mountain speckled thin with sheep;
Grey clouds, that shadowing spot the sunny fields;
And river, now with bushy rocks o'erbrow'd,
Now winding bright and full, with naked banks;
And seats, and lawns, the abbey, and the wood,
And cots, and hamlets, and faint city spire;
The channel there, the islands and white sails,
Dim coasts, and cloud-like hills, and shoreless ocean.
It seem'd like Omnipresence! God, methought,
Had built him there a temple; the whole world
Seem'd imaged in its vast circumference.
No wish profaned my overwhelmed heart.
Blest hour! It was a luxury—to be!
Ah, quiet dell! dear cot! and mount sublime!
I was constrain'd to quit you. Was it right,
While my unnumber'd brethren toil'd and bled,
That I should dream away the trusted hours
On rose-leaf beds, pamp'ring the coward heart
With feelings all too delicate for use?
Sweet is the tear that from some Howard's eye
Drops on the cheek of one he lifts from earth;

And he, that works me good with unmoved face,
Does it but half: he chills me while he aids,
My Benefactor, not my Brother Man!
Yet even this, this cold beneficence,
Seizes my praise, when I reflect on those,
The sluggard pity's vision-weaving tribe!
Who sigh for wretchedness, yet shun the wretched,
Nursing in some delicious solitude
Their slothful loves and dainty sympathies:
I therefore go, and join head, heart, and hand,
Active and firm, to fight the bloodless fight
Of science, freedom, and the truth in Christ.
Yet oft when, after honourable toil,
Rests the tired mind, and waking loves to dream,
My spirit shall revisit thee, dear cot!
Thy jasmine and thy window-peeping rose,
And myrtles fearless of the mild sea-air.
And I shall sigh fond wishes—sweet abode!
Ah—had none greater! And that all had such,
It might be so—but the time is not yet.
Speed it, O Father! Let thy kingdom come!

S. T. Coleridge.

"THE SUICIDE."

A DREARY and a dismal day,
A night as drear succeeds,
The stars shine forth with feeble ray,
And home each rustic speeds;—
But see! what female shivers in the gale?
Her face is wan with care and deadly pale.
Time's finger has not traced those lines
That mark her death-cold brow;
Some secret anguish undermines
Her frame, and bids it bow.
Her tresses, prematurely turn'd to grey,
Are suffer'd now to wander as they may.
And lo! upon her shrunken breast
A helpless infant lies;
Its arms close round its mother prest,
It neither sleeps nor cries.
Its eyes on hers all stedfastly are bent,
And seem almost to pierce her dread intent.
Now where a stream flows strong and deep,
Her falt'ring steps she turns,—
Each star seems brighter watch to keep,
With brighter radiance burns.
The moon, her misty shroud now laid aside,
Glides, like a ghost, to watch the Suicide.
The stars, reflected in the stream,
With ghastlier light are shown;
And each a fiery eye does seem,
That glares on her alone.
Her baby seeks her face in mute appeal,
But there Despair has set his iron seal.
And now she gives her babe a kiss,—
Now falters forth a prayer;
Now bends her o'er the dark abyss,—
Throws back her flowing hair;
One look to heaven—then plunges in the tide,
Her infant's murderer and a Suicide!

NARRATIVE OF AN EXPEDITION TO THE SUMMIT OF POPOCAPETETH, A VOLCANO OF PERU, IN 1834.

THE Valley of Mexico, one of the most picturesque sites in the world, is bounded on the east-south-east by a chain of mountains, from which rise two volcanoes, known under the Indian names of Iztaccihuatl and Popocatepeth. The tops of them, eternally covered with snow, are from sixteen to eighteen thousand feet above the level of the sea. The first, the nearest to Mexico, presents a crest irregularly indented, which extends from the north-west to the south-east. The second is a complete cone. It is somewhat like Etna, but its base rests not, like that of the latter, on a level plain. The Popocatepeth is situated on the edge of the great

plateau of the Cordilleras. On one side, towards the north-west, the forests of fir-trees which wholly enwrap it terminate at the foot of the valley, and the last trees mingle with the fields of corn, maize, and other European plants growing at that height; but towards the south-east the forests continue longer. They change in kind at every step, and soon wholly disappear, to give place to the sugar-cane, the cactus, and all the rich and peculiar vegetation of the tropics. A traveller, setting out from the volcanic sands, a little above the limits of vegetation, and descending in a direct line into the valley of Cuantla-Anulpas, would, in a few hours, pass through every climate, and might gather every plant growing between the equator and the poles.

From this situation it necessarily results that the

snows which are found on the south-east, must, in the given circumstances, be influenced by the exhalations of hot air which are continually arising from the valley of Cuantla, and so it is in effect. These snows melt partially in the dry season, and whilst the north of the volcanic cone is constantly covered with snow and ice, even to the very last fir, the lava and porphyry of the south are almost laid bare, even to the very top of the volcano.

It is, then, on this side that a passage must be sought in any attempt to reach the summit of this mountain, the most elevated of the northern continent of America, and this was the course pursued by Baron Gros, secretary to the French Legation at Mexico, who, in the year 1834, had the courage to undertake this perilous enterprise, accompanied in his bold project by M. de Gerolt, Consul-General of Prussia, and Mr. Egerton, an English painter. We will give the account in the Baron's own words:—

"I had made a similar attempt last year, but with very different results. My first attempt had been unsuccessful, but this year many circumstances concurred to favour us. We were provided with barometers, with a compass, with some thermometers, with a good telescope and hygrometer. I had had a tent constructed, under covert of which we might brave the storm. We had axes, saws, ropes, and poles with iron spikes, indispensable in an expedition of this kind; mine was fifteen feet in length; I determined that it should remain behind us on the top of the volcano, as the staff of a flag of triumph; but I said nothing of this to my travelling companions. We might fail in our enterprise, and I did not like to 'sell the bear-skin before I had killed the bear.'

"We set out, and arrived at Ozumbas at three o'clock in the evening. We sent to summon the same persons who had served us as guides the last year. They were Indians of the village of Atlanta, which is situated at the very foot of Popocatepetl. We laid in provisions for four days, and the next morning at seven o'clock we commenced climbing the mountain with our mules and our horses. At one o'clock we had reached the Vaqueria, or Rancho of Gacapepelo, quite like a Swiss chalet, serving for shelter to a numerous herd of cows, and the last inhabited spot on the mountain. At three we had arrived at the limits of vegetation, which we reached by almost beaten tracts, having had occasion to use our axes in one place only. To any one acquainted with the Alps, I need not say one word of these stupendous forests of oaks, of fir, and of larch, which must be traversed; they are alike in both hemispheres, save that at the foot of this mountain are to be found numerous flocks of guacamayas, large green parrots with red heads, which are to be met with neither at Chamouni, nor at Salleneches. There are also in the forests a small species of lion, jaguars, wolves, stags, roes, and a great quantity of wild cats, but we did not see a single one of all these animals.

"In proportion as we ascended into the wood, the firs became less frequent, and of smaller size. Near the sands they are all more or less stunted; and all their branches bend down to earth as if they sought lower down air less rarefied. After these last firs, of which the greater part are half decayed, are only to be found some bushes of a kind of gooseberry-tree, with a black fruit; then, at intervals, tufts of yellowish moss growing in semi-circles, amidst the fragments of pumice-stone, lava, and basalt; at length all vegetation wholly ceases. Then we began to feel that we were no longer in a region in which it was possible to live. Our respiration was impeded; a kind of depression not without charms seized upon us; in truth I can scarcely define the impression we experienced as we entered these deserts.

"From the moment the wood is left behind, nothing is to be seen up to the third part of the volcanic cone, but an immense extent of violet-coloured sand, so fine in some places that the wind ruffles the surface of it

with the perfect regularity of a ripple on the waters. Blocks of red porphyry are scattered up and down, and break the monotony of the spectacle. The top of the undulations formed by the sand is covered over by an immense quantity of little yellowish pumice-stones, which the winds appear to have gathered there in heaps; and along these sands run in furrows, till they are lost in the forest, some scorise of volcanic rocks descending from the masses of porphyry and black lava, which form the top of the mountain. The most elevated part of the volcano is entirely covered with snow, and this snow seems the more purely white, that the horizon along which it lies is of a blue so deep as almost to be black. Some traces of wolves and jaguars are visible upon the sands skirting the wood.

"After having admired for some time this singular spectacle we re-entered the forest, and I had the tent erected. We had suffered much from cold during the night.

"On the 29th, at three o'clock in the morning, favoured by a bright moonlight, we were on our way, warmly clothed, our face and eyes protected by green spectacles, and gauze of the same colour wrapped about our heads; my flag served me for a girdle. We were seven in number. Each of us carried a small bag, containing some bread and a bottle of sugared water. The Indians were loaded with our instruments and some provisions. We walked after one another, our iron-spiked sticks in our hands, and taking care to follow exactly the foot-tracks of the first guide, in order to be sure of firm footing. We proceeded very slowly, and were under the necessity of stopping at every fifteen paces to take breath. The bottle of sugared-water was of the greatest possible use to me; obliged to keep my mouth wide open in order to breathe, my throat used to clog to a degree that was quite painful, and some sips of water taken every five minutes alone prevented the pain from being insupportable. We were obliged to take a side-path, and to wind along it. The acclivity was so steep that it would have been alike difficult and dangerous to attempt to ascend in a direct line.

"At nine o'clock we had reached the celebrated Pico del Isaib; beyond which we were not able to get the last year. This Peak is a mass of trachyte reddish rocks, which are found on one of the concretes which come down from the summit. Its perpendicular height is eighty or one hundred feet by a diameter of fifty. It terminates in a point, and can be distinctly seen from Mexico. Our guides had with difficulty been prevailed upon to come so far, but nothing could induce them to continue their journey. The way to the Peak had been long and toilsome, but not at all dangerous. The oppression I felt was less great than I had anticipated, and my pulse was only up to 120. We had courage and determined purpose; time enough before us, and above our heads a sky transparent in its clearness.

"It formed part of our plan to stop at the Pico del Isaib, and then to repair our exhausted strength by taking a slight breakfast. I knew that at such an elevation we must be careful to eat very sparingly, and not to drink any spirituous liquor; for the nervous system is excited to a degree scarcely conceivable. We therefore took only a little bread, part of the breast of a chicken, and some water just tinged with red wine; and after an hour's rest at the foot of Pico, we once more set out on our ascent.

"After having passed the Isaib, we came on the left to a mass of rocks, exfoliating like slate. They rise perpendicularly to a hundred and fifty feet in height. The summit is covered with snow, and long stalactites of ice fill every fissure. There was no advancing on that side. On the right is a rather deep ravine, which at a distance we had taken for the remains of a crater. It extends in a direct line from the top of the volcano to the first firs, and is intersected by

basalt, lava and porphyry; and, in some parts, crossed through its whole breadth by walls of perpendicular rocks, and great heaps of snow: but we saw at a glance that we might, by taking a little circuit, ascend by it to the summit of the volcano. We got down, therefore, into the ravine, and, while keeping one another in view, took each a different path. M. de Gerolt took the middle, I took the left, the nearest to the wall of rocks; and Mr. Egerton went between us both. I thought at first that my path was the best, but I soon discovered my mistake; twenty times I was near breaking my neck, and, were I ever to undertake the same expedition, I would take the bottom of the ravine.

"When we could get upon the snow we proceeded with much more ease. It was now furrowed by the wind, and still more by the heat of the sun, precisely resembling a field newly ploughed. And as the furrows were parallel with the horizon, they served us as so many steps. In the sand and upon the rocks there was real danger; and the least heedlessness or awkwardness might have been fatal.

"At noon, we had wound round, and attained the summit of those perpendicular rocks before mentioned; but our strength was beginning to fail, and at every ten paces we were obliged to make a long stop to breathe, and to recover the effects of the too-quickened circulation of the blood. Though in the midst of snows, we experienced the sensation of cold only when we were drinking, or when we touched the metal of our instruments. It was necessary to cry very loud in order to be heard at a distance of twenty paces. Indeed the air at that height was so rarefied, that I tried in vain to whistle, and Mr. Egerton had the greatest difficulty in extracting any sounds from a horn he had brought with him.

"At half-past two M. de Gerolt was on the highest point of the volcano. He began to jump with joy, and made a sign to me, that there was a gulf at his feet. At thirty-seven minutes past two I had reached the summit, and found myself on the most elevated brink of the crater. Once there, all fatigue vanished; the breathing was again free; new life seemed to be imparted by the absorbing spectacle before me; I felt an enthusiasm, an excitement, scarcely to be conceived; and I jumped in my turn, to encourage Mr. Egerton, who had still to make his way over some bad passes. The crater is an immense gulf, almost circular, having a deep depression on the north side, and some spiracles on the south. It might be about a league in circumference, and nine hundred or a thousand feet in perpendicular depth. The walls of the gulf were peaked. They distinctly present three large horizontal strata, intersected perpendicularly and almost at equal distances by black and greyish lines. The bottom is a funnel formed by successive convulsions, still occurring almost daily. The inside edge, from the surface to about fifteen or twenty feet lower, is a mass of red, black, or whitish very thin strata, upon which rest the blocks of volcanic rocks yet destined to fall into the crater. Its walls are yellowish, and present at the first glance the appearance of a lime-stone quarry. The bottom, and the inclined plane of the funnel are covered with an immense quantity of blocks of sulphur perfectly pure. From this abyss are emitted, whirling round with the force of a whirlwind, masses of white exhalations, which disperse when they attain half the height of the inside of the crater. Some apertures in the declivity of the funnel project these also, as do likewise seven large fissures which are between the strata forming the edge of the crater; but these last vapours do not rise higher than fifteen or twenty feet.

"The apertures at bottom are circular, and surrounded by a large zone of pure sulphur. Doubtless these exhalations, which are disengaged with such force, carry with them a great quantity of sublimate of sulphur, a part of which is deposited on the stones and on the sides of the abyss. The disengagement of the sulphureous acid gas is so considerable, that we were greatly incom-

moded by it at the top of the volcano. We were not able to get at a piece of the whitish substance adhering to the side walls of the volcano. M. de Gerolt, who tried to bring away a specimen, had nearly paid dear for his imprudence. He had gone down to a little inclined plane, which was in one of the fissures of the crater; but the sand giving way under his feet, he was sliding rapidly into the abyss, when he happily succeeded in arresting his progress by his stick.

"The outward edge of the crater is entirely devoid of snow, but in the inside, where the sun has no power, a considerable number of stalactites of ice are found hanging down to where the third stratum begins. The summit of the volcano is a small platform of fifteen or twenty feet in diameter, where the same violet-coloured sand is found, which is in such abundance at the base of the cone, and the heat of which is sensible to the touch. It may well be conceived how imposing such a spectacle must have been. Those masses of lava, of porphyry, and of red and black scoræ; those vortices of exhalations; those stalactites, the sulphur, the snow, in short, all that singular admixture of frost and fire, found at an elevation of eighteen thousand feet, had wonderfully excited us. We were nearly worn out; I experienced a violent headache, and great fullness of blood about the temples; my pulse was up to 145, though, after a little rest, I did not feel much more oppressed than at the Pico del Isaib. We were all dreadfully pale, our lips were lividly blue, and our eyes sunk in their sockets, so that when we were resting ourselves on the rocks, with our arms thrown over our heads, or when we were lying stretched upon the sand, with closed eyes and mouth wide open, and without our masks, in order that we might breathe more freely, we resembled corpses, and, though I was aware of the real state of the case, I did not the less experience a disagreeable feeling, when my eye happened to fall upon any of my travelling companions.

"It is related in every history of the conquest of Mexico, that Don Diego Ordaz, one of the captains of Fernando Cortes, went to the volcano to procure sulphur for making powder. Perhaps there might have been then, on the declivity of the mountain, some fissures where it was deposited, as is still the case in Italy. I do not believe it possible to reach that which is to be found in the crater, and it is probable that in the time of Cortes, the volcano was in greater activity than it now is. The pure sulphur deposited at the bottom of the funnel is there in millions of quintals; the atmosphere is infested with its exhalations, and I have no doubt that it would be impossible to let one-self down two hundred feet into the gulf, without being asphyxiated by the sulphureous vapours. Now, as this depth would be but one fourth of the distance necessary to be passed through, in order to arrive at the yellow masses carpeting the bottom, supposing even that free respiration was possible, still to reach even the inclined plane nearest to the top, ropes of an immense length would be required, and how are they to be conveyed to the summit of the volcano, which it is so difficult to arrive at without any incumbrance, and where the slightest weight becomes an insupportable burden? I think, therefore, that if Diego Ordaz had collected sulphur on Popocatepet, it could only have been a little above the volcanic sands, and not in the crater.

"At half-past three we had completed our survey, and planted my standard on the most elevated point of the volcano; at four o'clock we had reached, on our way down, the great ravine of the Pico del Isaib, where we found our guides awaiting us. We made signs to them to go to the tent, and we continued to descend by a different route from that which we had taken in our ascent. At six o'clock, we were in our tent, but too much fatigued, and, still more, too much excited to sleep soundly. While awake, I could speak, I could think only of the crater, and, when I happened to fall asleep, I fancied myself still there, the oppression was again felt, and starting I awoke.

"The next day, the 30th of April, at 7 o'clock, we struck our tent, and at two o'clock p.m. we were at Ozumba. I placed, in the yard of the house in which we lodged, a good telescope fixed in the direction of the volcano, and for two days the yard was filled with curious spectators, who came to gaze upon our flag as it floated on high."

Baron Gros was not the only one who ascended to the summit of this volcano, though many attempts have failed from different causes. Some travellers, when arrived at a certain height, have been seized with a violent throwing up of blood, which has obliged them to desist from the enterprise. In 1825 and 1830, some Englishmen reached the crater. Mr. William Glenny is mentioned as the first who surmounted every obstacle.

How wonderfully do these phenomena exhibit the power of God! and, were it not for our dim-sightedness, we might also doubtless discover in them the goodness as well as the wisdom of the beneficent and almighty hand, which has so bountifully provided for the well-being of his creatures, and is not less mindful of his gracious purpose that all things should work together for good, even when the volcano is spreading terror and devastation around. But even now enough is known to lead us to conclude that, however fearful these eruptions are, the mischief occasioned is nothing in comparison to the advantage they are of, on the whole, to our globe. The bosom of the earth being full of fire, a vent is absolutely necessary by which the force of the dreadful element is broken and weakened. And though the countries where the subterraneous fires collect in greatest quantities, are subject to earthquakes, these would be still more violent if these volcanoes did not exist. But, even if all these phenomena were obscure and unintelligible to us, surely it becomes beings such as we are, who acknowledge ourselves to be the creatures of Infinite Wisdom and Infinite Love, to deal with those pages which we cannot decipher of that book of nature, on which, in so many countless places, are marked, in characters so plain that "he that runs may read," the rich goodness of its Author, in the spirit of him of old, who returned a volume which he had borrowed from a friend, saying—"There are many things in it I do not understand, but those which I do understand, are so excellent, that I am sure, to know all, would only give me fresh cause for believing the author worthy of still deeper veneration."

THE MAIDEN AUNT.

DUNCOMBE PARK.

CHAP. II.

JANET proceeded with her story,—"The last letter from Anna's friend arrived about five weeks ago, and gave a most melancholy account of them. They had been then several months without any pupils at all, and the lady said she believed they would come to England to seek employment, if it were not that they had been compelled to run in debt at Boulogne, and, not being able to pay their debts, of course they could not leave the place. Papa gave this letter back to Anna, as he had done all the others, without saying a word. But two days afterwards nurse told me that among the letters sent to the post that morning, had been one directed in papa's hand-writing to Mrs. Charles Harwood, to the care of Madame Viéville, Grande Rue, Boulogne. I was surprised that he wrote to Adèle and not to Charles; however I felt very happy, and thought it was all going to turn out well at last. I thought so still more, when, a fortnight afterwards, as we rose to leave the dining-room, papa told us, in his shortest manner, that Mrs. Charles Harwood and her children were coming to spend the Christmas with us. I could have jumped for joy, and in my ecstasy I could not help saying, 'Oh!

papa,—and Charles!' He knit his brow and said, 'Understand, both of you, that this is a subject on which I do not choose to be spoken to. You are to hear what I say, and make no answer.' Of course I dared not reply, but still I felt quite confident and very happy, till last Thursday, when nurse gave me a packet from Charles containing that note for you. There was also a letter for me, in which he told me that papa had written very shortly to Adèle, saying that he wished herself and her two children to spend the Christmas with him. Poor Charles was in ecstasies—he thought this was certainly the first step to a reconciliation—he made Adèle answer the cold brief invitation in the most grateful terms, and he himself wrote a long letter full of thanks, expressions of affection and repentance, and entreaties for forgiveness. This letter was immediately returned unopened. It was enclosed to Adèle, and in the cover were written these few lines:—

"Madam,—I shall be happy to receive yourself and your children as soon after the 17th of December as you can make it convenient to come to me. I return you unread a letter which never should have been written, and which never could have been sent, had you not made the great mistake of supposing that I could not distinguish between the misled and the misleader—between mere weakness and positive sin. You have never yet had any duty towards me to fulfil, and therefore you have transgressed none.—I remain, Madam, your sincere well-wisher,
EVERARD HARWOOD."

"Oh, what harsh harsh words!" cried poor Janet, interrupted by her own tears.

After a moment's pause she resumed her tale,—

"Charles told me that, in spite of these bitter words which have made him very miserable, he cannot give up all hope; he thinks still that papa *must* be intending to relent, and therefore he has decided that Adèle and the children shall certainly come. He desires me to tell you the whole history before you read his letter to you, and—but now, dear aunt Margaret, please read the letter."

I opened the paper, as she desired, and read as follows:—

"My dear kind aunt Peggy,—"

"Poor Charles!" said I, involuntarily stopping to wipe my eyes. I began again,—

"My dear kind aunt Peggy,—For well do I remember your kindness to me when I was a boy, and I should indeed be most ungrateful if I could forget the thousand and one treats and presents with which you used to brighten my school-days. It is the recollection of all this which makes me hope to find a friend in you now, and if you have not quite forgotten the affection which I know you used to bear me, (and I think it would be a hard matter for you to leave off loving any one,) you will not refuse to help me now that Janet has told you my sad story, and you know how unhappy I am."

"But how, *how* can I possibly help him?" asked I, interrupting myself again.

"Read on, and you will see!" cried Janet, whose face was full of joyful hope. I continued to read,—

"I will not take up your time by defences or apologies for my conduct. I was to blame,—I was wrong,—I don't seek to deny it, either to myself or to others. But I am severely punished, when I see the sweetest wife that ever brought happiness to a man's heart and home, and two innocent babes, actually suffering from want. Of my own personal affliction from the displeasure of a father whom I must ever revere, and the cessation of intercourse with sisters whom I love most tenderly, I will say little. Perhaps I deserved it. But has not my punishment lasted long enough? Now, my dear aunt Peggy," (the boy must know by instinct how that name wins its way to my heart,) "will you use your influence in my behalf? My father has the highest opinion of you. I have heard him say repeatedly that there is no person to whom he would so willingly confide the education of his daughters as to yourself. He has like-

wise a warmer feeling towards you, remembering that you were the favourite sister of my poor mother. I cannot help imagining that he is now just in the state of mind only to require to have the matter reasonably put before him to induce him to yield. I cannot but hope that a few arguments and a little persuasion from you would win my cause. Will you refuse to make the attempt? No, I am quite sure you will not; and the idea of your consent sends a feeling of happiness through my heart, to which it has been very long a stranger. God bless you, my dear aunt Peggy, and prosper you in the effort which I am sure you will make for me. I need not commend my Adèle to your kindness,—you will love her the moment you see her. And as to the piccaninnies, I know you love all babies, and I don't think you will like my little son and heir the less because he is reckoned the image of his unlucky father. Perhaps you will say I should write 'blameable' for 'unlucky,' and perhaps you are right—however, amid all my faults and misfortunes, I have still pleasure in signing myself, Your affectionate and grateful nephew,

CHARLES HARWOOD.

I put down the letter, and there was Janet's beaming face at my side. She clasped her arms about my neck, half-sobbing, and saying, "Oh dear aunt Margaret, you say yes, don't you? you will try for poor Charles, I'm sure you will." What could I do but kiss her, and promise to do my best? yet never did maiden aunt feel more bewildered than I did in the new position I had thus involuntarily assumed. In the first place I was a little afraid of my brother-in-law at all times; and, in the present instance, I felt by no means sure that he would not resent my interference, as quite uncalled for and impertinent. But then both Janet and Charles seemed so secure of my influence with him; and then, thought I, suppose I *should* succeed, suppose I *should* reconcile son and father, of what happiness should I be the cause, and what a delightful remembrance would it be for me, to the end of my life! Owen says, that to appeal to me about my usefulness, or my influence with others, is attacking me on my weak side. And certainly, when I leave a house, I *do* like to be able to say to myself that I have done some good in it. How could there be a better opportunity of doing good than this? I am getting sanguine, and my hopes outweigh my fears.

I am the more inclined to be confident because I cannot but agree with Charles that the invitation to Adèle, cold and ungracious as it is, must be considered as a sign that the colonel intends to relent. If he has no such intention, why did he not send them a remittance, instead of that unaccountable invitation? Poor dear Charles! Who could have fancied that he remembered me so well and so kindly? He was always a favourite of mine, but I little thought that the trifling kindnesses of so many years ago would make so deep an impression. How he must have suffered! and my sweet little Janet too,—what a singular mixture of prudence and feeling has she shown for so young a girl! The prudence has been taught her by fear, which, as I have often observed, will teach a sorrowful kind of caution, very painful to witness, even to a little child. But Anna,—there is a mystery in her. She must have a cold heart, I am afraid; perhaps her affections have never been encouraged to expand, for I suspect Janet is the favourite both with brother and father. As to Colonel Harwood, the more I reflect on his character the more hopeful I feel, though I was at first so much cast down. His temper, though roused to one violent ebullition by such defiance of authority, is evidently under control, and would certainly never show itself towards me, of whom he has so high an opinion. But I must go to work very carefully, and manage to introduce the subject at the right time, and in the right manner. Everything depends upon that. Some people in my situation would go blundering straightforward to the point they wished to attain, and spoil their work by their clumsy method of doing it. But

I fancy I have rather an aptness for the sort of thing, and, with the help of a little woman's wit, I do not despair of succeeding.

I am writing this account of my first day at Duncombe Park, in my bedroom, before going to rest, and I have so lost the thread of my story in meditating on the grand effort which I am to make to-morrow, that I had nearly forgotten to say how the evening passed off. There is not much to record. Anna joined us at the tea-table, and I tried to win my way through her reserve by talking to her of the German poets, with whom I supposed she was beginning to make acquaintance. But she seems more occupied with the grammatical structure of the language than with its literary stores, and she has a school-method of classing the "stars" which somewhat amused me. She puts Schiller above Uhland because he is less easy to comprehend, while Göthe stands highest of all, not by reason of his marvellous genius, but, "because he is so very difficult." The exquisite "Hermann and Dorothea," is however an exception among his works, and was contemptuously dismissed with the observation, "Oh, that is quite easy, I read that when I was only a beginner." This manner of judging was new to me as applied to literature, though I have remarked that it is common enough with reference to the fine arts; the accomplished pianist who utterly despises Mozart, and takes a cool superior tone about Beethoven, will speak with rapture of Thalberg or Doehler, and with a reverent awe of Chapin, proportioned to the difficulty of unravelling the involved mazes of his time, and decyphering the mysterious double sharps and triple flats, wherewith he is pleased to diversify the monotonous simplicity of musical notation. He is a politic man doubtless. Who cares for plain C? It is a note of no importance or dignity whatever. But call it D double flat, and immediately it is invested with a character of grandeur and originality which it might have sought to attain by any other means, in vain. The doctor who tells you to drink camomile tea three times a day, has no title to your respect,—no claim upon your faith. He might have won both if he had but had the sense to call for a sheet of paper, and write—*Decoctio florar: camomil: ter diem.*

After tea, my brother-in-law who had watched my conversation with Anna with evident satisfaction, (I kept it up the more diligently because I am of course anxious to encourage the high estimation in which I find that he holds me, and because I observed that he was pleased to see that I was likely to assist his daughters in their studies,) drew his chair forward and addressed me in his blandest and most cordial manner. "I like," said he, "to encourage and keep up all the old-fashioned customs connected with this season of the year. I am no enemy to merry-making in proper place and time, and among the other innocent amusements with which our grandfathers and grandmothers were accustomed to while away the long winter evenings, I, for one, see no objection to a good game of cards." His voice assumed a tone half inquiring, half congratulatory, as he closed this speech, and slightly rubbing his hands together he looked pointedly at me, as much as to say, "Here's a tolerant, benevolent, cheerful, benignant brother-in-law and father of a family for you." The plain English of these words and looks of deferential self-approval, was, that Colonel Harwood chose, on every winter's evening, to play whist for two mortal hours, and that I was expected to supply the place of the Dumbie who ordinarily held the fourth hand in the rubber. I positively detest cards, and am generally in the habit of making all sorts of mistakes, even in the simplest games; this evening, however, in pursuance of my plan of establishing myself in my brother-in-law's good graces, and maintaining him in that good opinion of me which he has chosen to adopt, I assumed my place at the table very amiably, and gave my whole attention to the matter in hand. And as,

happily for me, I was Janet's partner, my want of skill passed unnoticed, for the colonel was too well pleased to win, to depreciate the abilities of his antagonists, and we parted for the night, the best possible friends. And now, before I lay my head on my pillow, one more look upon those skies of dark clear frosty blue, on which every star stands out like a hewn projection of glittering diamond. Oh, perpetual reproof of the littleness of man! Is it not marvellous that he has walked beneath you for five thousand years, and has not yet received the placidity of your greatness into his soul? Would it not seem as though one glance upon the majesty of the midnight heavens were enough so to subdue, calm, and humble the spirit of a mortal, that all strifes, envyings, and jealousies, all vanity and all meanness should depart from it, never to return, giving place to noble shame, and assured though reverent hope?—Surely he who should ask his bitterest foe to forgive him, amid the silent magnificence of night, could never be repulsed!—Poor Charles! My last thought before I sleep is of you,—my last prayer is for the reconciliation of the father and son, and a voice within assures me that it shall not remain unanswered.

December 15th.—What a simpleton have I been! I could beat myself for very vexation! My ridiculous vanity has been at the bottom of it all—I am ashamed to look back at the pages of my journal and see how I had worked myself up into believing that I was appointed to heal the wounds, and soothe the differences, of this family. It is astonishing that I could so deceive myself. And now I have done harm instead of good; and I wish my tongue had been cut out before it exposed itself and me by such uncalled for absurdity. Well, it is fit that I should narrate all the particulars of my unhappy failure, as a punishment for the past, and a lesson for the future. I found no opportunity in the course of the morning for introducing the important subject. I had weighed the matter well in my mind, and decided that the presence of my nieces would be an obstacle to my success, and that I must choose some occasion when I should be alone with their father for making the attempt. This view I founded upon my supposed comprehension of the colonel's character, and I pumed myself not a little upon the penetration wherewith I imagined that I had estimated his various peculiarities, and the skill wherewith I believed myself to be suiting, allowing for, and taking advantage of them. Poor silly aunt Peggy! you are fit for nothing but worsted-work, letter-writing, and small talk! It seems to me, now, as though Charles and Janet were mad to give me such a commission—but theirs are young heads—what is to be said of the discretion of their mature confidante and agent?

To proceed, however,—I passed the whole day in studying to please and oblige my brother-in-law. At breakfast he amused himself by giving me, in a style at once elevated and colloquial, sublime and familiar, a sketch of the habits and pursuits of himself and his household. Had not every tone and gesture so completely expressed "this is the picture of a rational and happy family!" I believe I should have responded to his description by that very remark; but this incessant modest consciousness, and candid confession of great merit, effectually checks all disposition to admire. I found that he considered it part of his duty as a father, to exercise a certain sort of superintendence over the education of his children; at present, he was engaged in reading Italian with Anna, and giving Janet lessons in history. After all, he is really a well-read and accomplished man, and I have no right to ridicule him. His system of historical instruction seems to be a particular hobby; all his information is imparted by means of tables, which he draws up, and which Janet has to study till she is thoroughly mistress of the dates and succession of incidents for the period under consideration. It is then her business to compile from books, with which he supplies her, an abridged account of all

the events noted in the table, according to the order of their occurrence. The colonel is exactly the kind of man to reduce all knowledge to a matter of tables, systems, and abridgements. Nothing that exceeds the limits of a book of reference appears to him worthy of acquisition; and I could fancy him giving a "Tabular view of the characters in Shakespeare's plays, forming a key to a condensed edition of his works, in which all the similes are omitted, and every phrase, scene, or allusion, which has no direct reference to the evolution of the story, carefully expunged." In the plenitude of my amiability on this unlucky day, I offered him my assistance in drawing up the parallel tables of the histories of France, England, Spain, and Italy, during the first half of the thirteenth century, on which he was then employed. He seemed greatly pleased at the idea; and I worked for a couple of hours under his direction. When the tea-things were removed in the evening, it appeared that poor Anna was suffering from so violent a head-ache, that she was unable to take her place at the whist-table, and the colonel, with a vivacity which surprised me, proposed that he and I should adjourn to his study, and finish the business of the morning—a suggestion in which I, of course, readily acquiesced. He seemed quite eager about it; it is amusing how rapidly the pruness and pompousness of a man will evaporate under the influence of a real, downright hobby—for all men have their hobbies, even the prim and the pompous. He lighted a candle himself, and conducted me to his sanctum, moving, however, with the staid dignity which his gout rendered necessary, and which, on the present occasion, seemed more burdensome to him than usual. We there spent half-an-hour in hunting for authorities, after which we were to return to the drawing-room, to work upon the materials we had obtained. But, alas, my head was full of poor Charles, and my own enterprising determination! Instead of being an assistance to him, I was the greatest possible drawback; I turned over the leaves of a kind of dream, gave every date wrong, fitted the personages of one country into the history of another, violently compelling them to assume the costume of a third, and winding up my description with an abridged account of the arts, manufactures, and literature, of a fourth. The colonel is not a bright man, and his confusion was boundless.—"What is your authority," asked he at last, with much politeness, as he held my rough sketch in his hand, "what is your authority for attributing the social state of Spain in the thirteenth century, to the effect of the Norman invasion in the twelfth? You have mentioned it several times, and here, I see, you name 'the Conqueror,' but without designating more particularly the leader of this Norman invasion."

"You have got the sketch of England," cried I, in some perturbation. "No indeed," he returned, showing me the word *Spain*, in large letters, at the head of the unlucky sheet. "Will you have the goodness to let me look at the volume from which you have drawn up this little account."

In a kind of bewilderment, I handed him Adam's Roman Antiquities, which happened to stand next Rapin, and he spent at least five minutes in hunting through the index with knitted brows, and a face of increasing surprise, before it occurred to him to look at the title. Then his patience did seem a little disturbed, and I even thought I heard him mutter to himself the words, "Confound the Roman Antiquities!" However, he speedily recovered his usual courtesy, and proposed that we should return to the drawing-room, adding with a smile, that he thought I had had work enough for one day. He rose as he spoke, and I felt desperate. It is clear, that I could not have chosen a worse moment for my experiment than this, but some spirit of evil judgment possessed me, and I plunged into the dilemma headforemost, without pausing to consider.

"I wished to speak to you, Colonel Harwood," said I,

getting extremely hot, and feeling, at the instant, as if I were pronouncing my own sentence of transportation for life.

Standing still in his progress towards the door, he turned towards me with an air of polite interrogation. He said nothing, and I was compelled to proceed, though I felt that it was an abrupt and unpromising beginning.

"I have a great favour to ask—or rather, it is not a favour to me, but to your dear girls—your dear children I should say, and even to yourself." His brow visibly darkened, but, by this time, I had warmed with my subject, and went on fluently. "Ah my dear brother, it is so grievous that there should be a disunion in your family—now at this joyful time of year, when as you say yourself, all those who love each other ought to draw the bonds of their affection more closely, and feel that the one great cause for common thankfulness and common humiliation should heal all wounds and reconcile all differences: do not be angry with me for imploring you to forgive poor Charles, and take your son back to your heart again. He is sincerely penitent—that I know—and surely he has suffered long enough, and bitterly enough. If his dear mother were alive, how earnestly would she join my entreaty—for her sake, if for no other reason, grant him your forgiveness, and let us celebrate this Christmas by a happy meeting of the whole happy family."

While I spoke, the expression of my brother-in-law's countenance had changed from boundless astonishment to extreme indignation, and it was only the strong effort which he made to restrain his passion and behave with becoming calmness, which prevented him from bursting in upon me, ere I had concluded. As it was, he did hear me to the end, though I am quite certain, that from the moment in which he became aware of the purport of my speech, he neither listened nor heeded, but was solely employed in subduing his wrath, so as to be able to cut the matter short at once with due dignity, but at the same time with a proper degree of politeness and composure. It was in this spirit that he answered—

"You must pardon me my good lady, but this interference in family matters is scarcely well judged. I should be very sorry to speak harshly to you, and I am quite sure that you have the best possible intentions. After I have once put it clearly before you, that I am the sole judge of my own conduct, and that your position as a greatly esteemed sister, does not exactly entitle you to direct or advise me in the management of my family, I feel sure that your own good sense will show you that you have been in error, and that delicacy and propriety will induce you to avoid mentioning the subject to me again. Let us therefore forget the last five minutes, and return to our former friendly intercourse as if they had not occurred."

He thought he had done it to perfection. The mixture of authority, gentleness, and resolution, could not have been better contrived to overwhelm me with shame, and reduce me to silence. But, as he uttered the last gracious words, and was advancing with a slight and dignified wave of the hand to quit the room, that spiteful little demon who seemed ever on the watch to convert his sublimity into absurdity, caused him to stumble against a footstool, and, in order to save himself from falling, he was obliged to sit down with extreme suddenness on a chair which happened to stand near. As he did so, however, he maintained an air of unconsciousness, though his face flushed a little, and he looked boldly at me, as much as to say, "Will you presume to think for a moment that I did not intend to sit down in this chair?" And now, what can I say for myself? At my age, under my circumstances, with my whole heart full of interest for poor Charles, and indignation against his father, was it not inexcusable that I was unable to restrain my sense of the ludicrousness of this little incident? I could not restrain it, and I laughed aloud, though his eyes were full upon me. No offence could be greater than this. Actually pale with

passion, he turned from me, saying in a suppressed tone of voice, "This levity, madam, is wholly unaccountable, unless I am to suppose it a premeditated insult." He struck his hand vehemently and angrily upon his writing-desk as he spoke, and the historical tables flew upwards with a great flap, and put out the candle. The scene was now complete—or rather it attained perfection in the next minute, when my stately and furious brother-in-law, finding himself in the dark, and at an equally great distance from the door and the ball, was literally obliged to solicit the aid of my arm to return to the drawing-room, having twice struck his gouty foot against some obnoxious chair or table, in his attempt to complete the transit unassisted. "Will you have the goodness to give me your arm as far as the hall?" said he, in a short, snappish, sulky tone of voice, as unlike as possible to his usual dignified suavity. I hastened to comply, and happy was it for me, that he could not see my face, for, as we cautiously traversed the study floor, and I felt the pressure of his arm upon mine, and knew all the while that he was absolutely boiling over with rage against me, it was all I could do to keep from laughing in his face a second time. Anna's headache was a great comfort to us during the awkward hour and a-half which passed ere we separated for the night. It was a sufficient reason for the profound silence which prevailed. The sufferer lay on the sofa and never spoke; Janet and I sat side by side, engaged with our embroidery, and occasionally conversing in suppressed tones, and my poor brother-in-law leaned back in his easy chair, and pretended to read. Never was a man so thoroughly confounded and thrown out of his usual mode of action as he was that evening. I suppose such a thing had never occurred to him in his life before, nor had the faintest vision of the possibility of such a thing ever crossed his mind. And he really was quite at a loss, and did not know how to behave under it. This too was one of the most annoying facts of his position to him. Under all circumstances that had hitherto befallen him, he had preserved his conscious and elaborate dignity unruffled—whether he were acting the gracious host, the kind father, the stately master, or the severe disciplinarian, he had been decided, self-contemplative, and self-satisfied in all. The bursts of passion to which he had occasionally given way, had frightened those with whom he had to deal, and left him sole master of the field, with his foes flying on every hand. But he now found himself in the situation of the Chinese general, (pardon the anachronism!) who painted his soldier's faces, and made them clatter shovels and tongs together in order to scare the English—the English did not run away, they stood still and laughed—and the baffled general, not knowing how to make his mode of attack more awful, tore his pigtail for very vexation. My poor brother-in-law! How guilty I felt as I stole from time to time a peep at his flushed and troubled countenance, and perceived clearly that he was quite incapable of attending to the newspaper which he held in his hand, but that his angry and bewildered mind was employed in recapitulating to itself my heinous offences, and musing over the possibility of inflicting adequate punishment. I wished him good night like a culprit, and from the brusque, and (to use an unclassical but most expressive word) grumpy manner in which he replied, I knew that he had not yet recovered himself. I wonder on what line of conduct he will determine. I should not be much surprised at receiving notice to quit to-morrow morning. And now to bed—but scarcely, I am afraid, to sleep. The Colonel cannot be more provoked with me than I am with myself, and the recollection of Charles and Adèle banishes all disposition to slumber, and seems to put me into a fever.

BARN OWL.

NATURAL HISTORY OF BIRDS.—No. III.

Birds of Prey, concluded.

THE OWLS AND BUTCHER BIRDS.

THE STRIGIDÆ OR OWLS.

"What means the whooping owl, that nightly sits
In the dark hollows of the shadowy wood;
Scaring from sleep the sylvan neighbourhood;
Or strangely by the moonlit casement flits;
And by old ruins, moans and laughs by fits,
Mocking the solemn hour in changeful mood
As he, old gentleman, had lost his wits?
Is evil boding in his speech, or good?
Poor fowl, thou hast no omens. We ourselves
Are fancy's fools, interpreting thy notes:—
Perchance thou'rt watchman to the merry elves,
Bidding them don betimes their leafy coats,
Ere dawn should catch them on the brook's bright shelves,
And prick them homeward with the sunny notes."

Sonnet, from Blackwood.

THE gentle closing of a summer's day, and the approach of the "sweet hour of twilight," suggest thoughts of holy quiet and beautiful images of peace. The hard and rugged world-life has then passed; we hear only the departing echoes of its thousand distractions, and yield our souls to the influence of that soft ideal music, which, rising from leafy solitudes and ancient rivers, stirs the heart with deep harmonies. At such a time we think not of strife; all nature seems hushing herself to a rich repose; whilst, one by one, those mysterious sentinels, the silent stars, look from their distant towers upon the still earth. The nightingale's trill of "linked sweetness long drawn out," deepens, by its musical contrast, the repose in earth and air. But are *all* things now sinking to rest? Is peace the sole empress of the evening hour and of the silent night? Poetry may utter her full creed, and tell us all is hushed, but let us look into the region of facts, and lo! night is not wholly peaceful. On the wild desert the lion stealthily moves; in deep jungles, the tiger's dilated eye flashes through the darkness: nor is the stillness of the night air unbroken; then the owl moves with a strange silence through the air, in search of prey, startling with its ghastly aspect the peasant passing, with hurried steps, the churchyard.

As animals which appear during the day are exposed to the attacks of the diurnal birds of prey, eagles, vultures, and hawks, so those which come abroad in the night are assailed by the owls. Thus the agency of predacious birds, in restraining the too great increase of animal life, is not only exercised throughout a wide geographical space, but also during the hours of light and darkness. When the eagle retires to his mountain home, the owl sweeps from the forest, and steals, spirit-like, over the silent plain.

The owls are, perhaps, of all birds, the most peculiar

in appearance. The solemn look and bewigged head; the noiseless flight and nightly hunt; the ruined towers and solitary woods where most make their homes, combine to invest these birds with a species of mystery. The world, to say the truth, does not much like the owl; sees something suspicious about him, and would rather be quit of his company. He has, somehow, got a bad name, and very few will risk their credit by saying much in his favour. How the owl got into this unfortunate scrape, is difficult to understand. He has a suspicious liking, an ugly *penchant*, for dark places; loves to meditate among the tombs; keeps himself at home all day, as if scorning the occupations of all honest daylight birds; he never joins in bird-festivities, and seems always brooding over foul conspiracies against the state, or—against the sparrows in the neighbouring hedge. Then his voice is, to say the best, rather suspicious; it sounds far too ghostlike to be pleasant to rustic ears; as for Dame Hedgeton, she never remembers a death which the villanous owl did not predict.

The owl's antiquarian and sepulchral tastes have certainly been his ruin; and we fear it will be long before he obtains a respectable character amongst the peasantry. Superstition, or in other words, an ignorant imagination, has always ascribed something unearthly to the owl. In the farmer ill, approaching, it may be, his last hour, a light is of course kept in his room during the night; the white owl, whilst hunting, sees the distant gleam, and flying towards the window, utters his peculiar scream of surprise. In an instant all is terror within the house; the death-screach has been sounded, thinks the nurse, and all believe the sick man has received his solemn warning. Should he recover, the owl does not get the benefit; and should the farmer die, a servant or a son will watch, with loaded gun, for the next appearance of the unlucky bird.

Our popular ballads contribute to promote this feeling against one of the most interesting of birds. Is a maiden described pondering on the state of her dying lover? the opportunity is a good one for pelting the owl.

"Thus homeward as she hopeless went,
The churchyard path along,
The blast grew cold, the dark owl scream'd
Her lover's funeral song."

The only foundation for all this superstition, is, of course, in the mind of man; the habits of the owl may suggest melancholy associations, but these are sources of the richest poetry in cultivated men; it is ignorance alone that transforms such feelings into the terrible. The owl has also been considered a stupid bird, as if the imputation of witchery were not sufficient to upset his character. How is the charge of stupidity proved? Does not the bird sit moping uninterested by all the beauty and sprightliness of the day? exclaims an objector. Certainly most of the owls do sit all day at ease, and why not? day is not their working time, therefore they do not labour; but stop till evening approaches, then mark the skill with which the owl beats the fields in search of prey, watch the fire of its dilated eye, the sudden dart upon the mouse, the quantity of food conveyed to the nest in an hour, and from all these facts construct an argument, if you can, demonstrating the stupidity of the owl. Why did the Athenians consecrate this bird to Minerva? Because of its stupidity? Truly, Minerva must have relished the compliment.

These birds are not *wholly* nocturnal; that is, their flight is not confined to the hours of perfect night. Some make short flights during cloudy days, and most come abroad in the grey twilight, prolonging their chase through the greater part of moonlight nights. They are therefore more properly birds of *twilight* than of night; some species hunt in the thickest darkness, but this is not a characteristic of the whole family.

The *Strigidæ* are widely distributed over the whole earth, extending from America to Java, and from the Arctic regions to the Equator. Some species approach

the eagle in size, whilst others measure but a few inches from head to tail. But amidst all this variety of aspect and habitation, the owl preserves the same habits, attracting, in every land, peculiar attention. The whole family is divided into two divisions, the *long-horned* and *short-horned* owls; or, as some call them, the *long-eared* and *short-eared* owls. These *horns* or *ears* are simply feathers projecting from the bird's head, which have, at a little distance, the appearance of horns. In some of the species these feathers are numerous and long, forming a thick bunch; in others, the ear consists of one feather only.

We shall now proceed to notice some of the more interesting species of owls both British and foreign.

1. *The White or Barn Owl*, (*Strix Flammea*.) This species is the most common in England, and being found in every part of the country, its habits are better known than those of the more uncommon owls. It is more partial to mankind than the other species, forming its nest near barns, church towers, ruined buildings, and old trees near human habitations. The owl may be familiarized by kindness to dwell in the vicinity of man. The enthusiastic naturalist Waterton induced some to settle close to his house, and formed quite a thriving colony around him, in spite of the prediction of his housekeeper, that, "evil and owls dwell together." Frequently they would even enter Waterton's room, and indulge themselves with a peep into the mysteries of his furniture. So much did their various habits interest him, that he regarded the barn owl as one of the most attractive of British birds, calling it the "pretty ariel wanderer." He thus was not only ready, but eager to clear its character from the aspersions of the ignorant and cruel. The capacity of this bird for domestication was strongly proved by the Ornithologist Montagu. He reared, with all possible attention, three birds, a barn owl, a sparrowhawk, and a ringdove. For six months he attended to the birds with all possible care, and then set each at liberty; the owl alone returned, thus proving the strong attachment of which this bird is capable. The name of *barn owl* is of course given from its selection of such localities, where every wise farmer will protect it.

One owl will keep under the mice more effectually than half a dozen cats, and the farmer's dame, whose stores are injured by these busy animals, should by all means endeavour to induce an owl to settle near the mouse colony: a surprising diminution in their numbers will be the result. It is peculiarly interesting to watch the owl beating for food in the evening twilight. It is then seen, with a slow and noiseless motion, to pass from spot to spot over the field; at last it darts down; then rising, returns to the nest with the prey which we may be sure it has secured. Again we see it beating along, and again it is down, then back to the nest as before. Each of those pounces has been fatal to some mouse enjoying his evening walk; and thus a pair of owls may be observed night after night pursuing their hunting. Sometimes the barn owl is seen in the daytime seizing upon a mouse or small bird, but this is not often the case. The eyes of this species seem particularly fitted for the night; no barn, however dark, can conceal the mouse from the watchful owl, which sitting on a beam, marks the smallest moving object on the ground.

It is a curious fact that the barn owl will sometimes dart upon a fish as it swims near the surface. Some have doubted this, but the testimony of such an observer as Waterton is not to be distrusted. He saw this kind of owl plunge fairly into the water, near the spot whence he was watching their movements, and bring up its funny prey. Mice are the favourite food of the white owl, and this renders the bringing up the young, by a naturalist, rather difficult, as they require to be continually supplied with these animals. The quantity devoured in a single summer by the white owl must be enormous; one mouse being captured by a pair of owls every five

minutes during their foraging time in the evening. Hence the advantage of owls in a corn-growing district is obvious.

Gilbert White thus describes the evening hunts of these birds:—"About an hour before sunset (for then the mice begin to run) they sally forth in quest of prey, and hunt all round the hedges of meadows and small enclosures for them, which seem to be their only food. In this irregular country we can stand upon an eminence, and see them beat the fields like a setting dog, and often drop down in the grass or corn. I have minuted these birds with my watch for an hour together, and have found that they return to the nest, the one or the other of them, about once in five minutes." An owl's nest may be easily found by quantities of little round pellets lying under it. These pellets are the indigestible portions of food, which the owl casts up through its mouth; a peculiarity common to the whole family. Some of these pellets are often found to contain the indigestible remnants of half a dozen mice.

The barn owl is the true "screech-owl," and does not *hoot*; though Sir W. Jardine says it does hoot sometimes. The hooting of the white owl must, however, be one of those rare events which happen once in fifty years, for the closest observer has not detected such an occurrence. The *scream* of this owl is, however, distinct enough, and not over pleasant; especially when heard by a nervous or superstitious person in some lonely spot at fall of evening. The eggs are of a dirty white or cream colour, as, indeed, are the eggs of all owls; for though the different species have a great variety of colour and plumage, the eggs of all have nearly the same appearance. The reader who is unable to obtain a sight of the eggs of these and other birds, may see them well coloured in Mr. Hewitson's British Oology.

2. *The Tawny Owl, or Brown Owl*, (*Strix Stridula*.) This British species is the true *hooting owl*, the *white*, which we have just described, being the true *screech owl*. The brown owl is not so common as the white, from which it differs much in its habits. It is not so partial to the neighbourhood of men, seeking a home in deep woods and solitary places, where it finds the reclusiveness which it loves. When woods are cut down, and a tract of country laid open to the works of man, the hooting owl retires to more secluded spots. Gamekeepers are also its fierce foes, and destroy it without mercy, deeming it destructive to game, for which the brown owl evinces a predilection. Notwithstanding their love of solitude, they may be induced to settle near human dwellings, when certain trees are temptingly prepared for their reception. They love hollows in ash trees, and some naturalists have drawn numbers of these owls around them by piercing holes in certain of these trees. The sound of this bird's voice has a strong resemblance to human tones. Waterton thus describes its peculiar hoot; and, though he may fail to give a clear idea of the sound, we here transcribe his words: "Were you to pronounce the letter O in a loud and very clear tone of voice, and then, after a short pause, repeat the same letter in a drawing, tremulous accent, you would have a tolerably just notion of the hooting of the owl." Such a sound issuing from the depth of gloomy woods, or the vicinity of burial places, may naturally suggest superstitious notions to the timid or the rustic mind. This owl is an excellent mouser, but does not limit its diet to suppers of mouse-flesh; the luxury of birds' flesh and leverets has some considerable attraction for the brown owl, who is a more miscellaneous feeder than his lighter coloured brother.

3. *Short-horned Owl*, (*Strix Brachyotus*.) is another British species, though not common in the southern part of England. The white and brown owls are without horns, but this species has these appendages, which, however, are not always perceived by those who obtain a sight of the bird, as they are only raised when it is alarmed or excited. You may often meet with this owl on the Scottish moors, or the heaths of northern England,

and mark its short flights, without perceiving the least appearance of horns; but if the bird is alarmed by your approach, the feathers are instantly raised, the eyes glance rapidly round, and the whole appearance is that of a most pugnacious and determined little warrior. It is called in some parts of England the *Woodcock Owl*, from its arriving at the same time with that bird.

From the peculiar shape of its head, the term *Mouse hawk* is sometimes applied to this owl, especially in the regions round Hudson's Bay, where it is found in large numbers. It is a singular and most interesting sight to meet with a large flock of these owls quietly resting in some sheltered field, whence upon the least alarm, they take flight, each with his horn raised, as if in defiance of the foe. Very few species of the owl family are met with in large parties, whereas these are sometimes seen in groups of twenty or thirty. The short-eared owl is found in all countries between America and Siberia, but breeds in the high northern latitudes, especially in Norway and the Orkneys.

4. *The Great Horned Owl*.—This owl approaches some of the eagles in size, measuring twenty inches in length. It is rarely found in England, but abounds in some of the deep forests and dismal swamps of America, where its wild cry often startles the hunter, or terrifies the Indian benighted in the sombre woods. It often frequents burial-grounds, and Wilson, the far-famed ornithologist, describes the fright into which a party of superstitious Scottish highlanders were thrown by the wailing cry of this owl. The men had remained, for the night, near an Indian burial-ground in a lonely region, and had demolished some of the wood-work near the tombs, to make a fire. After supper they were preparing to lie down to rest, when, from the silence of the graves, came such prolonged melancholy wailings, that sleep was effectually banished from the whole party for that night. The highlanders, being ignorant of the habits of this owl, ascribed the doleful cries to the ghosts of departed Indians. The sounds sometimes resemble the words "Waugh O! Waugh O!" at others have a startling similarity to the half-stifled screams of a suffocating person. Audubon, in his magnificent work on the birds of America, thus describes these nocturnal outcries: "Sometimes he utters a shriek so horrid that the woods echo its dismal sounds; now it seems as if you heard the barking of a cur-dog; again the notes are so rough and mingled together, that they might be mistaken for the last gurgling of a murdered person." Pleasant companions, the English reader will suppose, these birds must be for the timid traveller!

There are seasons when the great horned owl appears in a more pleasing character. Often, when the canoe is sweeping across some silent lake, and the paddles flash in the bright moonlight, is the form of this owl seen skimming with majestic motion the tranquil waters, and delighting the observer with its magnificent eagle-like circles. With what quietness are these evolutions performed! were the eyes closed, this majestic bird would pass over the boatmen without discovering his presence by a sound from those velvet wings. It may here be remarked that the wings of owls, and especially those which fly more in the night, are so constructed that scarcely any sound can proceed from their motion. The wing feathers terminate in fine hair-like points; hence their passage through the air is almost noiseless,—so much so, that the shadow of the bird on the ground has sometimes been the first indication of its presence. Such silence in flying was necessary for birds destined to pursue their prey in the still hours of the night, when the slightest sounds would be sufficient to give notice of their approach, and warn the victim of the coming danger. The Indian priests are said by Wilson to wear a stuffed owl of this species on their heads for a crest, or on their arms for a badge, probably in consequence of some supernatural powers ascribed to the bird by the natives.

5. *The Snowy Owl (Strix Nyctea)*—is another remark-

able member of the Strigidae family, not often seen in England, but ranked amongst the British species, as it breeds in the Orkney Isles. The name, taken from the colour of the bird, also corresponds with its favourite localities, which are in the coldest regions of the North, Greenland, Lapland, Hudson's Bay, and places in similar latitudes. The plumage of the snowy owl is beautifully adapted to its Arctic homes, being so exquisitely fine and close that little inconvenience can result to the bird from the cold of the severest winter. The legs are hidden by a mass of streaming plumage, serving for a most excellent dread-nought. The colour, resembling that of snow, enables the bird to hunt in the day, without being seen until close upon its prey. Sometimes the Laplander, or Beaver-hunter, is startled by perceiving the wide and silently flapping wings of the snowy owl crossing his path within a few yards, so nearly may it approach, ere the eye can distinguish the moving body from the snow over which it passes. The food consists of hares, rabbits, and smaller quadrupeds, to which is sometimes added a dinner of fish; thus proving that more than one species of owl has a liking for the finny tribe. The snowy owl does not, however, appear to plunge into the water after fish, as our barn owl will sometimes do, but snatches them from the water in a most dexterous manner with its claws. A correspondent of Audubon thus describes the angling of the snowy owl, which, though not according to the rules of Isaac Walton, is remarkably clever, and proves the *Strix Nyctea* to be an excellent caterer. Taking its stand upon a fragment of floating timber, it watches for the rising of fish by the side of the wood, and as they "unwittingly rose to the surface near the edge, that instant the owl thrust out the foot next the water, and with the quickness of lightning seized a fish and drew it out." Not bad this for a stupid bird. The snowy owl sometimes takes a sea-voyage, perhaps for the pleasure of fishing in salt water, or in search of some island for a breeding-place. Whatever be the cause, they have been met with at sea two hundred miles from the nearest land. The cries of the snowy owl have some resemblance to the screams of its great horned relative which we have just described; but as the former flies more during the daylight, its wild whooping songs are not quite so startling.

6. *The Barred Owl (Strix Nebulosa)*, is named from the broad stripes or bars across its tail, and is seldom seen in England, preferring the northern parts of America, where it is considered the representative of our brown or hooting owl, which, however, it much exceeds in size. Our sober English owl does sometimes use his voice to pretty good purpose, but purely on matters of business, or when a little crossed in temper; but its American representative seems, at times, as if employed in getting up a complete chorus of laughter. Audubon, who heard its hilarious bursts, likens the sound to the merry laugh often heard from a party of men. Whether this is meant for a sly hit at human laughter, or a compliment to the capacities of this owl for fun, we do not presume to say. If owls can enjoy a joke, then, doubtless, this particular species is a sort of wit among birds, as his whole air, and the tones of his voice, suggest the notion of a sprightliness not often visible amongst the staid Strigidae. Audubon was so taken with the bird's air and manners, as to name it the "Sancho Panza of our woods."

7. *The Little Owl of America (Strix Acadica)*, is worthy of remark on account of its peculiar voice, which resembles the grating of a saw, and from this circumstance the bird has received the name of the *saw-chit*. So perfect is this resemblance to the sounds produced in a saw-mill, that travellers have frequently commenced a search for the appearance of a mill, the noises of which seemed close at hand. It has also a peculiar talent for ventriloquism, by which it often effectually deceives persons unacquainted with its habits. Mr. Macculloch, a friend of Audubon, describes an illusion of this nature experienced by himself. Whilst walking

in a forest, the sound of a distant bell struck upon his ear. Surprised at this occurrence, he hastened towards the spot, the strange sound being repeated, as he advanced, from another direction. He at length discovered the little owl peeping from a hole in a tree, and found that from it these singular tones had proceeded.

This owl is generally found in deep forests, but evinces no dislike to human habitations: one of these birds was actually seen to alight on the edge of a cradle in which an infant was sleeping, on whom he continued gazing for some time with that philosophical air so characteristic of the owl.

8. *The Burrowing Owl*, (*Strix Cunicularia*).—This species is remarkable for making its abode in the holes dug by the prairie-dogs of America. These quadrupeds form, in some parts of America, large colonies, and dig numerous holes in the ground, wherein they burrow. The owl, of which we are now treating, does not take the trouble to excavate a house for himself, but politely walks into one of the hollows formed by the prairie-dog, which, perhaps disliking such a fellow-lodger, evacuates the premises, and leaves the owl in possession rent-free. All, however, do not find it convenient to seek a new residence, and in this case the owl becomes a co-tenant with the original occupier; probably the quadruped draws some rent from the intruder in the shape of fragments of food brought in by the Burrowing Owl.

This bird has less of the true owl appearance than others of the family, the feathers of the legs being much shorter, and the whole aspect more lightsome than in others of the *Strigidae*.

This owl was discovered by Mr. Say, one of the party despatched to explore the territory of the Rocky Mountains; and thus a most interesting member of the *Strigidae* family has been added to the ornithological system. Other varieties of the owl race might be named, but the above species are sufficient to illustrate the character and habits of this extensive family. One bird, popularly called an owl, we have purposely omitted, as it is, in fact, no owl at all. We allude to the *Fern Owl*, which is a species of the *Caprimulgidae*, and will be noticed in its proper place. Here, therefore, we conclude these brief notices of the birds which so often heighten the interest of lonely ruins, and connect the deep gloom of hoary woods with a poetic melancholy. Those whose tastes or studies lead them to the ruined abbeys and castles of the land; or to some of those ivy-mantled priories which so thickly dot the banks of the Thames, on its winding course by the Berkshire, Buckinghamshire, and Oxfordshire borders, may have their reminiscences of these birds revived by the foregoing descriptions; whilst such as are cut off from these opportunities may have their knowledge of nature extended and their admiration of her varied works increased.

It remains for us to conclude this article with some remarks on another family of predacious birds,

The Laniadae, Shrikes, or Butcher birds.—This family connects the true birds of prey with those which feed upon insects and seeds. They are certainly birds of prey, as they kill and eat small birds, and therefore must be classed amongst the *Raptores*; on the other hand, the structure of their feet places the shrikes amongst the non-predacious orders.

They are all small, the largest not much exceeding the thrush in size, whilst some are not larger than a sparrow; but all possess an unusual share of fierceness and courage. The family epithet *Laniadae* is descriptive of the habits of the order; the word being derived from *Lanius*, signifying a *butcher*; hence they are often called *Butcher birds*.

Some account of the following species will suffice to illustrate the habits of the whole family.

1. *The large grey Butcher bird* (*Lanius Excubitor*).—This is the largest of our English species, and is not so rare as many suppose; though in some parts of the country the most persevering naturalist might fail to discover them. It is with us during autumn and winter,

when its food consists of mice, frogs, small birds, and large insects. The peculiar characteristic of all this family is the mode of killing and feeding upon their prey. They generally strangle small birds, from which custom some term them "*hanging birds*;" the prey is then impaled upon a sharp and stout thorn, when the shrike tears the body with its beak.

Selby, in his *British Ornithology*, describes the operation in a passage which, though it has been repeatedly cited, may interest those readers who have never witnessed this peculiar feat of the Butcher bird. He is speaking of the large grey shrike, and says, "I had the gratification of witnessing this operation of the shrike upon a hedge-sparrow, which it had just killed; it hovered with the prey in its bill for a short time over the hedge, apparently occupied in selecting a thorn fit for its purpose. Upon disturbing it and advancing to the spot, I found the sparrow firmly fixed by the wing at the selected twig." The following passage from Wilson will still further illustrate the shrike's proceedings. "Mr. Bell, while on his travels through Russia, had one of these birds given him, which he kept in a room, having fixed up a sharp stick in the wall for him; and on turning some small birds loose into the room, the Butcher bird instantly caught them by the throat, in such a manner, as soon to suffocate them, and then stuck them on the stick, pulling them on with bill and claws; and so served as many as were turned loose one after another." This impulse to impale the prey is so strong, that the caged shrike tries to fasten its food to the wires of the cage.

They evince a preference for the brains of birds, and usually cleave the skull to secure these desired morsels.

The country people in some parts call this shrike the *murdering magpie*, a tolerably apt description, it must be confessed. Other provincial names are the *mountain magpie*, *mattiges*, and *wireangle*. This last appellation is evidently derived from the old English word *wire-angle*, which signified a fierce bird; and in this sense Chaucer employs the epithet. Pennant, in his *Arctic Zoology*, says that the Germans call it the *wurchangel*, or suffocating angel, from its custom of strangling birds. The connexion between the words wireangle and wurchangel is obvious.

Some assert that the shrike imitates the voices of other birds, in order to decoy them within its reach; whilst others, and especially a modern writer, ridicule the notion, confidently denying the whole statement. Audubon, however, distinctly intimates that such is the case with the American grey shrike; he says, "This valiant little warrior possesses the faculty of imitating the notes of other birds, especially such as are indicative of pain. Thus it will often mimic the cries of a sparrow, and other small birds, so as to make you believe you hear them screaming in the claws of a hawk; and I strongly suspect this is done for the purpose of inducing others to come from their coverts to the rescue of their suffering brethren." The fact of imitation is here most positively stated: the object of the bird is only presumed.

2. *The Red-backed Butcher bird* (*Lanius Collurio*).—This is much more common in England, especially in the south-western parts, than the last-mentioned species, and arrives here from Africa in May; this shrike is therefore with us during the summer. The courage of this little bird is surprising, and it may be said not to know fear; the very decoys of bird-catchers are not safe from its attacks, as it not unfrequently pounces upon them, within a short distance of the men. In some parts of England it bears the odd name of Jack Baker, but wherefore is a mystery.

This bird feeds much upon large insects, such as beetles and humble-bees, which it impales upon thorns before attempting to feed upon them. The tendency to procure insect-food is not unusual in birds of prey; the eagles and hawks evince the same desire.

These observations on the more common shrikes may

serve to indicate the habits of the whole family, and induce lovers of Natural History to watch the proceedings of the butcher-birds in their neighbourhoods.

Here we must conclude our remarks on the first great order of birds—the Raptures. We have now before us the history of less warlike tribes, and our attention will be directed to the manners of those varied multitudes which fill our woods with rich harmonies, or excite our admiration by their singular habits and curious instincts.

PRESENCE OF MIND.

PRESENCE of mind may be described as the power of determining what is fittest to be done upon any sudden occasion, and under adverse circumstances, and of carrying the design into immediate execution with such success as to lead one to suppose it an action of calm deliberation. It is, in short, the union of rapid thought and self-command. This power is possessed by individuals in very different degrees. Minds are so diversely constituted, that we often see the same circumstances producing quite opposite effects. Thus an emergency, that totally unnerves one man, is just sufficient to call the powers of another into full activity. Whilst the former cannot act at all, but seems reduced to a state of mental paralysis, the latter applies himself with calm energy to the difficulties of the case, and escapes the perils that appeared inevitable, by an intuitive selection of the only path that could lead him out in safety. Presence of mind is more generally diffused amongst men than women, but, perhaps, the most striking isolated examples are told of females. Most people have heard of the mother, who, seeing her infant so near the edge of a precipice that the slightest advance would hurl the little creature to destruction, had the presence of mind to suppress the scream of alarm that was on the point of breaking out. Simply whispering the little creature's name, and at the same time baring her breast, she drew it from its dangerous position into the safe haven of her arms. When presence of mind is combined with fortitude, the compound is very admirable; and there are few things that show, in a greater degree, the power of the mind over the body. The following circumstances, which took place a few years ago in an English county, are a pointed illustration of this unusual combination of qualities:—

“A young couple, named Aubrey, inhabited a tolerably large house in the village of —, in Norfolk. The house—an old one—was built in a garden of considerable size, and had no other occupants than the gentleman and lady just mentioned, their infant, rather more than a year old, and a single female domestic, who had not been very long in their service. Every evening at nine o'clock a silence the most complete reigned throughout the village; at ten the lights in the different houses began to be extinguished, and in a short time no ray disturbed the blank darkness. It must have been a very extraordinary circumstance if any steps were afterwards heard in the street. Judge, then, of the utter solitude of a house screened by elms and sycamores, and standing three or four hundred yards from the public way. One evening, in the month of November, Mrs. Aubrey was in the house, awaiting the return of her husband, whom some affair of business had called away in the morning, to a town about six miles distant. He expected to receive a

considerable sum of money in the course of the day, and his wife had prevailed upon him to take a pair of pistols, as he anticipated being detained until after nightfall. About six o'clock in the evening Mrs. Aubrey went up-stairs, accompanied by the servant, for the purpose of putting the child to bed. The room was on the first-floor, a large apartment, looking into the garden. The wainscot darkened by time, the heavy furniture, some family portraits with sedate countenances and in ancient costumes, gave the room a somewhat gloomy appearance. Opposite to the chimney there was a deep recess, in which stood the bed; and near this was placed the child's cradle. The curtains were drawn, but one corner had caught by accident on some piece of furniture, and a post of the bed was exposed; a fine massive piece of carving, on which some cabinet-maker of yore had expended no slight amount of skill and patience.

“The night was dark and melancholy, quite in character with the time of year. Gusts of wind rattled on the windows, dashing the rain violently against the glass. The trees in the garden, bending under the sudden currents of air, occasionally struck the house-side—a gloomy and monotonous concert this—and no human voice mingled in it to promise assistance in case of need. Mrs. Aubrey seated herself on a low chair at a corner of the hearth. The light of the fire, and that of a lamp placed on the chimney-piece, striking some objects in full, and leaving others in darkness, made all kinds of strange effects by their opposition or combination. The child, which fully occupied her attention, sat on her knee, whilst the servant executed some commands of her mistress at the other end of the room. Being about to complete the child's readiness for its couch, the mother turned towards the cradle to see that it was prepared, and just at the moment, a bright flame shooting out, threw a strong light upon the recess. Conceive, if you can, her astonishment, and the start she gave, when, under the bed, and at the place where the curtain had been lifted up, she perceived, as plain as ever she saw anything in her life, a pair of thick clouted boots, in such a position that it was evident they contained feet. In an instant, a world of thoughts rushed through her brain, and the utter helplessness of her situation flashed upon her. It did not admit of a doubt that a man was there with some evil intention, either to rob or murder. Her husband would probably not reach home before eight, and it was then scarcely half-past six. Mrs. Aubrey, however, possessed sufficient command over herself not to do what a thousand other women would have done, namely, fall to shrieking. To all appearance, the man had reckoned upon staying where he was for a considerable time; perhaps he had intended to remain until midnight, and then carry off the money that Mr. Aubrey was to receive; but, if obliged to come out of his lurking-place now, he might revenge himself upon the two defenceless women, and stop all information of theirs by putting them to death. Then, who could tell? perhaps the servant herself might be in league with the fellow. Indeed, there had been of late certain grounds of suspicion, as regards the girl, which Mrs. Aubrey had disregarded, but they now forced themselves on her mind. All these reflections occurred to her in much less time than I have taken to put them down.

“She came to a determination at once. She first

thought of some pretext to get the servant out of the room:—'Mary,' she said, with as steady a voice as she could assume, 'you know what your master will like for supper; I wish you would go and make it ready. He will be pleased, I am sure, that we have thought of it.'—'Will you not need me here, as usual, ma'am?' inquired the girl. 'No; I can do all myself, thank you; go and cook as nice a supper as you can; for I am sure my husband ought to have something nice after a long ride, and in such weather.' After some delay, which doubled her mistress's anxiety, although she endeavoured to repress it, the servant quitted the room. The sounds of her footsteps died away on the stairs, and then Mrs. Aubrey truly felt herself alone,—yet the two feet remained there, in their shadowy concealment, without stirring. She kept near the fire, holding the infant on her lap, now and then speaking to it, but only mechanically, for she could not remove her eyes from that horrible sight. The poor child cried to be at rest, but the cradle was near the bed, and under the bed were those frightful feet,—it was impossible to go near them. She made a violent effort, however—'Come, then, darling!' she murmured; and, lifting the child in her arms, and supporting herself on her trembling limbs, she went towards the cradle. She is now beside the feet!—she places the baby in its little nest; concealing, as well as she can, the tremors of her voice, she rocks the cradle in time to the song she usually sings. All the time she sang, she kept fancying a dagger was lifted up to strike her, and there was no one to succour her. Well, baby fell asleep, and Mrs. Aubrey returned to her seat near the fire. She durst not quit the room, for that might excite the suspicion of the man, and the servant, who was probably his accomplice; besides, she wished to remain near her infant. It was now no more than seven—an hour—still a full hour before her husband would reach home! Her eyes are chained, by a species of fascination, to the two feet;—she cannot direct them to any other object. A profound silence reigns in the room; baby sleeps peacefully; its mother sits motionless—a statue; her hands crossed on her lap, her lips half open, her eyes fixed, and her breast has a fearful tightness across it.

"Now and then there was a noise without in the garden, and Mrs. Aubrey's heart leaped within her, for she imagined it announced her husband's arrival and her own deliverance. But no, not yet; she was deceived; it was merely the sound of the wind, or the rain, on the trees. She might be the only being in the world, so deep and mournful was the silence. Every minute seemed an age. Look! look! the feet stir. Is the man coming out of his concealment? No, it was nothing but a slight movement, perhaps involuntarily made to ease an unpleasant position. Again the two feet are quiet.

"The clock is audible once more, but it is only to chime the half-hour. Half-past seven; no more than half-past seven! Oh, how full of anguish was every minute! Repeatedly she addressed prayers on High for a period to this hideous suspense. Upon the chimney-piece there was a book of religious meditation; she reached it, and tried to read. In vain!—her eyes wandered off the page continually to see if the clouted boots were still under the bed. Then a new source of anxiety shot through her head—What, if her husband does not come after all!

The weather was bad, and his parents, who lived in the town whither he had gone, might prevail upon him to remain with them over night. She would not be astonished if he complied, especially as he had a good deal of money about his person. Heavens!—What, if he come not at all!

"Eight o'clock has struck, and there is no arrival. The possibility her active brain suggested becomes every moment more and more probable. For two hours did this agonized female bear up against her thoughts, but at length it became hopeless to hope. Hark! Is that a noise? She has been deceived so often before, she is afraid to believe her senses, and yet, this time, there is no deception. The entrance-door opens, is closed; steps come along the lobby, and mount the stairs; the room door turns on its hinges. Yes, 'tis he!—it is her husband! But if it had been a stranger, he would have seemed a messenger from heaven. Well, in he walked, a fine athletic figure. Down go the pistols upon the table; off comes the cloak, thoroughly soaked, I can tell you;—a happy man was he to see all he loved dearest in the world. He stretched his hands to his wife, who grasped them convulsively; but, exercising her wonderful self-command once more, she stifled her emotion, and, without uttering a word, she placed a finger on her lips, and pointed with the other hand to the two feet. If Mr. Aubrey had doubted for a moment what to do, he had not deserved to be the husband of such a woman. By a sign, he made her comprehend his meaning, and then said, 'Just wait one moment, my dear wife; I have left my portfolio down-stairs, I will step for it.' He was not two minutes absent; he came back with a pistol, the charge of which he had examined. He advanced towards the bed, and then seized one of the feet with his left hand, whilst with his right he held the pistol, ready to fire in case of need.

"'If you resist,' cried he, with a voice of thunder, 'you are a dead man!'

"The person to whom the feet belonged did not seem inclined to put this contingency to the test. He was dragged into the middle of the floor, crouching under the pistol that was pointed at his head. He was then searched, and a poniard, carefully concealed, was found upon him. He was a thorough scoundrel in his appearance, and he confessed to have been in league with the female servant, who had told him he might expect a rich booty that night. All this time the infant was never quite awakened.

"Both the criminals were handed over to justice; both were convicted upon trial, and punished. Notwithstanding Mrs. Aubrey's temporary courage, she was attacked the same evening with a violent nervous disorder, and some time elapsed before it quite left her."

—♦—

TO-MORROW is still the fatal time when all is to be rectified. To-morrow comes—it goes—and still I please myself with the shadow, while I lose the reality; unmindful that the present time alone is ours, the future is yet unborn, and the past is dead, and can only live (as parents in their children) in the actions it has produced.—*Budgell.*

THE time we live ought not to be computed by the number of years, but by the use that has been made of it; thus, it is not the extent of ground, but the yearly rent, which gives the value to the estate.—*Ibid.*

THE fear of the consequences of sin, exhibits itself in various gradations in those who are gradually and consciously approaching the common end; and shows, however it may be disguised, that the remembrance even of deviations from the course of right, corrodes the heart, and diminishes the sum of happiness.—*Ogle's Biographical Preface to the Spectator.*

POPULAR YEAR BOOK.

July 9.—Every year on this day, the eve of the great fair at Wolverhampton, there was formerly a procession of men in antique armour, preceded by musicians playing the *fair tune*, and followed by the steward of the deanery manor, the peace-officers, and many of the principal inhabitants. Tradition affirms that the ceremony originated when Wolverhampton was a great emporium of wool, and resorted to by merchants of the staple from all parts of England. The necessity of an armed force to keep peace and order during the fair, (which is said to have lasted fourteen days,) is not improbable. This custom of *walking the fair*, as it was called, with the armed procession, &c., was first omitted about the year 1789.

July 10.—In the night of the 10th of July, 1212, within four years after the completion of London-bridge, a dreadful conflagration took place upon it. Stow's account of this catastrophe is as follows: "The borough of Southwark upon the south side of the river Thames, as also the church of the Lady of the Canons there, (now called St. Saviour's), being on fire, and an exceeding great multitude of people passing the bridge, either to extinguish and quench it, or else to gaze and behold it; suddenly the north part, by blowing of the south wind was also set on fire; and the people which were even now passing the bridge, perceiving the same, would have returned but were stopped by the fire: and it came to pass, that as they stayed or protracted the time, the other end of the bridge also, namely the south end, was fired; so the people, thronging themselves between the two fires, did nothing else but expect present death. Then there came to aid them many ships and vessels, into which the multitude so unadvisedly rushed, that the ships being thereby drowned, they all perished. It was said, that through the fire and shipwrecks, there were destroyed above three thousand persons, whose bodies were found in part or half burned, besides those that were wholly burned to ashes, and could not be found."

July 12.—Erasmus Desiderius, one of the most eminent scholars of the age in which he flourished, departed this life at Basil, on this day, 1536. He was born at Rotterdam in 1467, being the illegitimate son of one Gerrard, by the daughter of a physician. When he was only nine years of age his father died, and the orphan was left to the care of three guardians, who determined on bringing him up to the monastic life that they might enjoy his patrimony. With this design, they removed him from one convent to another, till at last, in 1486, he took the habit among the canons regular at Stein, near Tergou. The conventual life being disagreeable to him, he accepted an invitation from the Archbishop of Cambray, to reside with him. During his abode with this prelate he was ordained priest, but in 1496, he went to Paris, and supported himself by giving private lectures. In 1497, he visited England, and met with a kind reception from the most eminent scholars. On his return to the Continent he spent twelve years in France, Italy, and the Netherlands, and during that time he published several works of great merit. In 1506, he took his doctor's degree at Turin, and went to Bologna, where he continued some time. Thence he removed to Venice, and resided with the famous Aldus Manutius. From Venice he went to

Padua and Rome, where many offers were made him to settle; but having received an invitation from Henry VIII., he came to England again in 1510; wrote his "Praise of Folly," while residing with Sir Thomas More, and was appointed Margaret Professor of Divinity or Greek Lecturer at Cambridge. In 1514, he once more returned to the Continent, and lived chiefly at Basil, where he prepared his edition of the New Testament with a Latin translation; and his celebrated "Colloquies," which gave such offence to the monks that they used to say, "Erasmus laid the egg which Luther hatched." With Luther, however, he was at open hostility.

July 15.—St. Swithin's Day.

St. Swithin, or Swithan, who is commemorated by the English and Latin Churches on this day, was born of noble Saxon parents. He received the holy order of priesthood from Helmstan, Bishop of Winchester, and was appointed by him President of the Old Monastery in that city. He early distinguished himself for literary acquirements. Egbert, King of the West Saxons, not only appointed him his priest, but confided to him the education of the good Prince Ethelwolf, (the father of Alfred the Great,) on whose accession to the throne, A. D. 835, Swithin became Sub-deacon of Winchester and Lord Chancellor. On the decease of Helmstan he succeeded him in his Bishopric, which he ably filled until his death, A. D. 862.

There is a popular adage, That if it rains on St. Swithin's Festival, there will be rain the next forty days afterwards, and *vice versa*. It has been expressed in rhyme as follows:—

"St. Swithin's Day, if thou dost rain,
For forty days it will remain;
St. Swithin's Day, if thou be fair,
For forty days 'twill rain na mair."

In Poor Robin's Almanack for 1697, this opinion, together with one of St. Swithin's reputed miracles, is thus noticed:—

"In this month is St. Swithin's Day,
On which, if that it rain, they say
Full forty days after it will,
Or more or less, some rain distill.
This Swithin was a Saint I trow,
And Winchester's Bishop also,
Who in his time did many a feat,
As Popish legends do repeat:
A woman having broke her eggs,
By stumbling at another's legs,
For which she made a woful cry,
St. Swithin chanced for to come by,
Who made them all as sound, or more
Than ever that they were before.
But whether this was so or no,
'Tis more than you or I do know:
Better it is to rise betime,
And to make hay while sun doth shine,
Than to believe in tales or lies
Which idle monks and friars devise."

We do not agree with the sweeping charge against the mediæval Ecclesiastical Chroniclers contained in Robin's concluding lines. The origin of the above proverb is rather obscure. It is supposed, however, to have taken its rise from the following circumstances:—St. Swithin desired that he might be buried in the open churchyard, and not in the chancel of the minster, as was usual with other bishops, and his request was complied with; but the monks, upon his canonization, considering it disgraceful for the saint to be in a public cemetery, resolved to remove his relics into the choir, which was to have been done with solemn procession on the 15th of July; it rained, however, so violently for forty days together at this season, that their design was abandoned; and, instead, they erected a chapel over his grave, at which many miracles are said to have been wrought. "Without disputing," observes Brady, "the fact from which the

popular fancy sprang, which is very probable to have been the case; there is, nevertheless, not any occasion to have recourse to a miracle to account for such a phenomenon. Experience has amply shown, that, whenever a wet season sets in about the middle of June to the middle of July, at which time the heat of the sun is usually the most intense, it generally continues till nearly the end of the summer, when the action of that orb has considerably abated; the rain affording matter for exhalation, always naturally the strongest at the hottest period of the year, and those exhalations yielding in return matter for rain."

Rain on St. Swithin's Day is noticed in some places by this old saying, "St. Swithin is christening the apples."

July 18—Petrarch, or Petrarca Francesco, the illustrious bard of Italy, put off mortality on this day, 1374. He was born at Arezzo in 1304. On account of the dissensions which raged in his native country, his father removed him to Avignon, and afterwards to Carpentras. At these places, and at Montpellier and Bologna, he received his education. He was designed for the law; but, on the decease of his parents, took Holy Orders, and followed literary pursuits. Having settled at Avignon, he became enamoured of the beautiful Laura de Noves; but, though he lauded her charms in odes and sonnets, he failed to obtain her affection. After having travelled in the vain hope of moderating his love, he settled at Vaucluse, a romantic spot, where he wrote some of his finest works. His literary reputation attracted the regards of princes; he was invited to Paris, to Naples, and to Rome, and received the laurel crown in the last city, wherein the titles and prerogatives of Poet Laureate were revived after a lapse of 1300 years. In 1348 his feelings were deeply wounded by the death of Laura. He survived her, however, nearly thirty years.

Palm Leaves.

MAHADI.

MAHADI, the son of the Caliph Almansor, was quite as extravagant as his father had been covetous; he squandered with carelessness what had been amassed with painful economy. He lived only for his own pleasure, and sacrificed everything to his self gratification; he cared little for the welfare of his state and its inhabitants, and left all to the control of his ministers, who, taking advantage of his careless indifference, sought only the advancement of their own insatiable selfishness.

One day, as Mahadi was out hunting a gazelle, he outstripped his followers, and lost himself in a wilderness. Night drew on; he was hungry, thirsty, and tired after his long chase, and he had half made up his mind that he must pass the night on the bare ground under the blue vault of heaven, when suddenly he observed in the distance a solitary tent.

Mahadi gathered all his strength to reach the tent before it became quite dark. Its inhabitant, an old Arab, came out directly he beheld him, helped him to dismount from his horse, treated him, as is usual among Arabs, with the greatest hospitality, and inquired, in amazement, how he came into that wilderness.

The Caliph did not discover himself, but replied that he belonged to the followers of the Caliph, and had lost himself in the chase.

"How do you manage to live in this desert?" asked he of the old Arab.

"What you now see as a desert was not always so," answered he. "The whole of the surrounding country was inhabited by many Arab and Turkoman tribes, who made a good subsistence by traffic and agriculture, and willingly paid a large tribute to the Caliph."

"And why is it no longer so?" said Mahadi, with curiosity.

"It could not end otherwise," returned the Arab, with candour. "Almansor was a good prince; he reigned himself, and did not give the government of his faithful subjects into the hands of avaricious and deceitful governors, like our present Caliph, Mahadi. If the latter continue to interest himself thus little in the government, it will not be long ere there are more such deserts as this in his dominions."

Mahadi now, for the first time, heard a truth with which he certainly would not have become acquainted had he discovered himself to the Arab. The free open-heartedness of the old man did not offend him, but it awakened in him a determination to keep a sharper eye upon his deputies, and in future to interest himself more actively in the government.

The laws of Mahomet forbid the use of wine, and the Arab considered some time before he ventured to offer any to his guest. He did so at last, when he saw how sorely exhausted he was, and did not meet with a refusal. With warm hospitality he brought out a pitcher, and rejoiced that he had it in his power to refresh the stranger.

Mahadi took a good draught, and thereupon assured his kind host that he should not have reason to regret his friendly reception of him; he was, he said, one of the chief servants of the Caliph, and would not forget him.

The Arab rejoiced that he had the honour to entertain so noble a guest; he sought to gain his favour, and redoubled his attentions.

Mahadi drank once more of the wine, and found himself not only refreshed, but inspirited. After a third draught, "I must tell you," said he, quite confidentially, to his host, "that I am the favourite of the Caliph, and manage all his affairs; in return for your hospitality to me, he shall load you with beneficence."

The Arab reverentially kissed the seam of his guest's robe, and entreated him to command everything his home afforded, and not to spare the wine, if he found it to his taste.

By degrees Mahadi ceased to require pressing, and became quite merry and talkative. At last he took the old Arab's hand, and said, smiling: "My good friend, in wine is truth; your hospitality obliges me to confess it to you; I am the Caliph Mahadi himself, and as Caliph I confirm all the promises I have already made to you."

The Arab stared with open eyes at his guest; but, instead of falling reverently upon the ground, he silently took up the wine-cup, and went towards the door.

"What are you going to do?" asked Mahadi.

"To prevent your drinking more wine," quietly answered the Arab. "At the first draught you were a servant of the Caliph, at the third his favourite, and at the fifth or sixth you become the Caliph himself. I know not what to believe; but whoever you may be, I expect that by the eighth or ninth

draught you will declare yourself our great Prophet himself, which, of course, I could not believe. I will therefore take away the liquor which makes you so communicative."

The Arab went out, and did not return. After waiting a long time in vain, Mahadi wrapped himself in the rug which his worthy host had prepared for him, and soon fell asleep.

The next morning he mounted his horse, and took the Arab, who was yet in great doubt what to believe, with him as his guide.

When they came to Bagdad, however, all doubt was removed from the mind of the honest old man; he perceived that he had actually entertained the Caliph, who, on his part, fulfilled all his promises, loaded the Arab with presents, and, above all, placed in his hands a large sum to reinstate his tribes in their former dwelling-place, and to restore them to their original prosperity.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE BATTLE OF BLENHEIM.¹

IT WAS a summer evening,
Old Kaspar's work was done;
And he beside his cottage door
Was sitting in the sun,
And by him sported on the green,
His little grandchild, Wilhelmine.

She saw her brother Peterkin
Roll something large and round,
That he beside the rivulet
In playing there had found:
He came to ask what he had found,
That was so large, and smooth, and round.

Old Kaspar took it from the boy
Who stood expectant by,
And then the old man shook his head,
And with a natural sigh,
"Tis some poor fellow's skull," said he,
"Who fell in the great victory."

"I find them in the garden, for
There's many here about,
And often when I go to plough,
The ploughshare turns them out;
For many thousand men," said he,
"Were slain in the great victory."

"Now tell us what 'twas all about,"
Young Peterkin he cries,
And little Wilhelmine looks up
With wonder-waiting eyes.
"Now tell us all about the war,
And what they kill'd each other for."

"It was the English," Kaspar cried,
"That put the French to rout,
But what they kill'd each other for,
I could not well make out.
But every body said," quoth he,
"That 'twas a famous victory."

"My father lived at Blenheim, then,
Yon little stream hard by,
They burn'd his dwelling to the ground,
And he was forced to fly;
So with his wife and child he fled,
Nor had he where to rest his head."

(1) See Illustration, p. 161.

"With fire and sword the country round
Was wasted far and wide,
And many a chilling mother then,
And new-born infant died.
But things like these, you know, must be
At every famous victory."

"They say it was a shocking sight
After the field was won,
For many thousand bodies here
Lay rotting in the sun;
But things like that, you know, must be
At every famous victory."

"Great praise the Duke of Marlbro' won,
And our good Prince Eugene."

"Why, 'twas a very wicked thing!"
Said little Wilhelmine.

"Nay, nay, my little girl," quoth he,
"It was a famous victory."

"And every body praised the Duke,
Who such a fight did win."

"But what good came of it at last?"
Quoth little Peterkin.

"Why that I cannot tell," said he,
"But 'twas a famous victory."

Southey.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

THE Envoy, or Elchee, as the Persians called him, had among other plans for doing good, one for the introduction of potatoes. Among those who listened to him, and applauded his disinterested intentions to benefit Persia, was a fat, smooth-faced young merchant, who obtained a promise of a considerable quantity of potatoes for seed, having, according to his own report, rented a large piece of ground, that he might be an humble instrument in the hands of the British representative, for doing good. The latter, pleased with his zeal, honoured this excellent man with such particular attention, that, conceiving himself a prime favourite, he ventured one day to suggest that, "as the season was too far advanced for the potato-garden that year, it would not be unworthy of the Elchee's wonted liberality to commute his intended present for a pair of pistols or a piece of British broadcloth." This premature discovery of the real object of this professed improver of the soil, produced no little ridicule, in which his countrymen, who were jealous of the favour he had enjoyed, joined most heartily. He was known to the day of his death, which happened three years ago, by the name of "Potatoes." It is satisfactory to add, that the plan for introducing this valuable root did not fail; they were found to flourish at Abusheher, where they are called "Malcolm's plum," after the Elchee, who looks to the accident which gave his name to a useful vegetable, as one of his best chances of enduring fame.—*Sketches of Persia.*

ASTROLOGY AND ASTRONOMY.

WERE we asked to point out one sole subject indicative of the improvement in the public mind within a few years, we should at once refer to our Almanacks; not even have children's story-books undergone so great a revolution as these publications. Astrology has risen into astronomy; credulity and ignorance no longer dare to lay the fault of their evil doings upon circumstances which they can neither control nor understand. It is, however, a fact, that from the very earliest times the planets have been considered as in some mysterious manner concerned with the affairs of our world. Their ancient appellation in Hebrew, signifying "disposers," points to some such belief; probably their moving, their going to and fro, gave rise to this; so ancient is it, that one writer of great learning reads the 16th verse of 1st of Genesis, "He made the planets also." The wish to learn our future lot is natural to us all; it does not spring from mere curiosity, but from the yearning for

happiness, which, in a more lofty sense, gives us the assurance of a future state; the boundary between hope and credulity is a mere line, a shadow; we feel this every day of our lives; why then should we wonder that ignorant persons have sought to gratify their intense desire for a view of the hidden future by looking into those eyes of heaven, the stars? A certain quantity of credulity will always be afloat in the world; it may sometimes take one form, sometimes another; but it will always exist; and it is well that it should be so as evidence that the manufacture of wealth is not wholly engrossing, grinding, and corporalising. The enlightened classes may talk against the evils of ignorance;—truly they are many; but that superstition which calls Friday an unlucky day, and that credulity which believes in a horoscope, are not more utterly degrading to the soul than the seeking after gain; the referring of every virtue to the weight of the purse; the chicanery to obtain money; and the lending of every faculty to make the

most of it, which is the character of our present day. We hear much of the decline of the drama, and of the dearth of true poetry; these are but the features of the time; we might say, the reflux of the mighty wave of poets and dramatists who ornamented the reign of Anne and her successors, to the present time; the wave will return again, at its appointed period. Meanwhile, we are in a prosaic state, and much good do we reap thereby. A rage for rational information pervades all classes; and if the imagination be not encouraged to run riot in dreamy shades of unreal things, it is at least taught to dwell upon the works of those whose genius has stood the test of time and opinion.

We are not of the number of those who consider our forefathers as mere barbarians, because to them gas and steam were unknown, or at least untried, agents; they had wisdom in their day, and a true, manly-hearted wisdom it often was; but there are points and subjects which show our progression in intellect so strongly, that we may well be excused if we dwell upon them; and of these, as we have said, is the downfall of astrology. We still read, it is true, of credulous women being cheated out of their hard-earned money by the "cunning man," or perhaps woman; the farmer, intelligent upon all that regards soil, manure, and farming management, yet keeps the goat to avert evil from his sheep; the cottager will still seek a remedy for disease from one who rides a grey horse; but these instances are becoming every year more rare; credulity does not walk openfaced through the land, nor is it to be found reigning in high places, as of yore. But we are under considerable obligations to credulity; this semi-vice (for that can scarcely be termed a vice which is the involuntary result of ignorance) has led the way to many of our most brilliant and useful scientific discoveries; a strong mind escapes from its thralldom, and either attains the truth itself, or points the way for others to attain it. Thus has it been with astrology. Man first marked the great division of time by the sun; he then learned to understand the computation of months and weeks by the moon; and so on to his years and cycles. The influence of the sun and moon was obvious and marked, upon the great concerns of the globe; why not, then, believe that the lesser luminaries, the planets, whose ever changing position, whose "comings and goings" were concerned in the changes of seasons, why not believe that these beautiful orbs were commissioned to influence the destinies of man? It was a beautiful and a humble thought that the Infinite and Allpowerful had delegated to the "disposers" that influence over the personal interests of his creatures, the question concerning which has been disputed in all ages, and without a hope of satisfactory solution. It is in this view that we would look at astrology, not as a mere jugglery practised by the knave upon the dupe, (though to this it has too often led,) but as a consequence of certain qualities of the human mind, harmless, perhaps praiseworthy, but becoming rank from lack of cultivation, and thereby losing beauty and delicacy.

From what country we derive the rudiments of astronomical science has been a matter of dispute. It has been said that the knowledge of the ancient Bramins must have been perfected under a higher degree of latitude than that in which Benares now lies. However this may be, whether our present knowledge be a recurrence to that which has been buried by the sands of Tartary, or whether it be a gradual progression from the first point of inquiry, soon after or before the Deluge, it is certain that some knowledge of astronomy has existed from very early ages. We may not credit implicitly the report of Calisthenes; the marvel of that report rests upon other doubtful circumstances; but we know that the builders of the Pyramids were not mere ignorant pileers of stone upon stone, and the druidical wonders of Stonehenge show that Newton was not the originator of the cycle which bears his name. To what country are we now referred? To Chaldea!—to that order of philosophers who have left the trace of their name in every

region where learning and science have penetrated! We will not dwell upon them; their origin unknown—their office undefined—their language melted away—their spirit still lives in the labours of Newton, of Kepler, of Herschell, unprofaned by the gross delusions which clouded the discoveries of earlier investigators, even of Plato.

Modern Europe—(we have wrenched our thoughts from the East)—owes much gratitude to the unhappy Alphonso of Castile, surnamed the Wise, as one of the earliest efficient patrons of astronomy. In his reign the sages of Chaldea were naturalised in Spain, and the bond of science united strange races and conflicting creeds—the Goth and the Roman, the Jew and the Saracen—beneath the sway of the royal philosopher. By the command of Alphonso, Greek and Arabic works were revised and translated, giving a mighty impulse to the study of astronomy; and if, through a weakness not incompatible with a powerful but ignorant mind, the king indeed deserved the title of astrologer given to him by his enemies, it is not to these works that the blame must be ascribed. Astrology, though not discredited, was but a secondary object with the Arabian and Jewish mathematicians, for reasons founded upon their religious prejudices. The Jews, persecuted and dispersed, had not yet ventured to lift their hopes to a re-union in their promised kingdom; astrology offered no balm to the wounds of their national pride; the Promise which they had forfeited was built on surer grounds than the conjunction of planets or the calculations of cycles: the Mahometans needed not the aid of astrology to tell them of the increasing domination of their religion under the able successors of their prophet; the career of Mahomet had fulfilled the decree of destiny in their belief; but to Christians astrology offered much, and eagerly did they take the bait, as we shall notice presently. Many of the treatises brought forward by Alphonso have scarcely a symptom of the perversion of science; they contain useful knowledge, enabling the student to solve the practical problems of astronomy. The celebrated Alphonsine tables were the production of a combination of the most learned astronomers of the time, summoned from distant parts, and during five years employed in the work. After the tables were completed Alphonso dismissed the sages with handsome rewards and privileges. Misfortune came upon the royal astronomer; deposed, heart-broken, he yet, according to his own poem, derived some consolation from the reflection that,

"His tables had to foreign lands made known
His fame, more nobly than his sword or throne."

In the time of the Stuarts astrologers reaped a rich harvest of notoriety, and often of more substantial gains. The character of James I., that strange problem in kingly history, was well calculated to foster the occult science, even had the king himself not been a believer; and in the time of his misgoverned and misgoverning son, there was a feverish anticipation of change afloat in men's minds, which tended alike to sturdy action or to indolent credulity. The Memoirs of William Lilly show us the astrological secrets of the time, and make us acquainted with strange impostures. The actors were men of low station, ignorant and devoid of principle. Lilly himself was a spy under the Commonwealth, engaging "both body and soul in the cause of Parliament; but still with much affection unto his Majesty's person, and unto monarchy, which I loved and approved beyond any government whatever." The name of Dr. Simon Forman is notorious as connected with the history of the Countess of Essex. He practised medicine under a Leyden degree, without a license from the London College of Physicians, and hence became obnoxious to the faculty, who had him put in prison. Lilly says that Forman had "good success in resolving questions about marriage," a profitable branch of the profession we should imagine.

Various predictions have from time to time appeared in England, and that the appetite for them has not yet

yielded to the influence of the "schoolmaster," was evidenced by the late alarm respecting the threatened earthquake. We think that so bold and intelligible a prophecy will not again be ventured, and as certainly not believed, if ventured.

We purpose to notice the subject of Alchemy, at a future time, and close these remarks with some lines of pretended prophecy by Sir Thomas Brown; the tenth line, perhaps to the author one of the most improbable, is now fulfilled by the English—Tartars, in as far as they are Celts—subduing the Chinese. The prophecy respecting Venice also is fulfilled, by the operations of nature, aided by human circumstances. The lines deserve attentive consideration.

"When New England shall trouble New Spain;
When Jamaica shall be Lady of the isles and the main;
When Spain shall be in America hid,
And Mexico prove another Madrid;
When Mahomet's ships on the Baltic shall ride,
And Turks shall labour to have ports on that side;
When Africa shall no more sell out her blacks,
To make slaves and drudges to the American tracks;
When Batavia the old shall be subdued by the new;
When a new drove of Tartars shall China subdue;
When America shall cease to send out its treasure,
But employ it at home in American pleasure;
When the new world shall the old invade,
Nor count them their lords, but their fellows in trade;
When men shall almost pass to Venice by land,
Not in deep water, but from sand to sand;
When Nova Zembla shall be no stay,
Unto them who pass to or from Cathay;—
Then think strange things are come to light,
Whereof but few have had a foresight."

F. C. B.

SHOPPING.

A TALE.

"I won't take any this morning, thank you," said a pretty girl, laying down the rich silk at which she had just been looking, and which, with lace, gloves, and other things, lay upon the counter of a linen-draper's shop.

So the lady went out again, and not alone, for a youth of about her own age, and much resembling her, followed her; they walked arm in arm along the crowded street, and a conversation ensued.

"Surely, my dear sister, you did not think of what you were doing: we were in that shop an hour at least, and I don't know how many things you looked at and handled—had we not better go back and purchase something?"

"Ridiculous, Charles. I did not intend to buy anything to day, but I wanted just to see the things, for Miss Poulter told me they had the most delicate French silks she had ever seen. I cannot afford to purchase one just now, and papa, you know, is so particular, that I dare not have it on credit, else I should much like it; that rose-pink would suit my complexion so well, and positively I have nothing now fit to wear. O, how I should like to wear that pink silk at Jane Edwards' wedding breakfast, with some jessamine in my hair—but I can't afford it, and so must not think of it."

From the reiteration of "I can't afford it," and "I have nothing fit to wear," persons unversed in ladies' wardrobes might conclude that the speaker was in very moderate circumstances, and that her stock of garments was poor; such, however, was not the case, and her costume this morning prevented such a supposition.

The young man who had been unfolding the coveted

silks, wearily began to fold them up, and replace them; as he passed up the shop for this purpose, he was stopped by a superior.

"Did you sell nothing to that lady, Graham?"

"Nothing, sir, she would not buy."

"Very well, this is the third time that has happened this morning; indeed, you seem peculiarly unhandy: if it occur again, I shall report you."

The shopman went to his accustomed place, and sighed heavily. "This situation," said he, "is my only hope of subsistence; I am very unfortunate."

Many persons presented themselves soon, for it was a fine day, and he somewhat retrieved his reputation; indeed, he had every incentive to try, for he had a mother, and a sister just growing out of her girlhood, almost entirely dependent on him for support.

By and by the gas was lighted, and its effects were speedily visible on the row of pale faces behind the counter; in some it seemed to drive their heart's blood farther from their cheeks, while to others it was inspiration. Then the eyes were bright, and the cheeks glowed with excitement. At last it was time to leave off business—late enough it came—but it was there at last, and the shutters were put up; when the "clearing away" had been duly performed, all the young men (with the exception of two or three who had to unpack new arrivals of goods) betook themselves to their recreations. The more animal to sleep, and the rest to the most palatable amusements they could find.

We will glance into a well-furnished sitting-room in this house, where sit two gentlemen smoking together; they were the partners in this house of business.

"I wish those fellows would attend to their own business, that's all; what right have they to interfere with us! I suppose I may keep my shutters down as long as I choose, may I not? Where's the freedom of Englishmen, if I'm obliged to shut up at an early hour to oblige a set of fellows who know nothing about my affairs, and who agitate disturbances between my servants and myself? eh! Johnson!"

This was said by the more elderly of the two, a hard-featured grey-haired man, whose eyes betrayed a disposition to cunning.

His young co-partner replied, "Why, you see, sir, they say, where's the freedom of Englishmen if you be allowed to persist in not shutting up earlier?"

"I hear," said Mr. Smith, not deigning to take the slightest notice of the interruption, "that there's secretly a movement among our people in favour of this: is it so? you are more with them than I."

"Well, I think there is; that is, they have had a meeting among themselves, and Graham was in the chair: that is a guarantee for the good conduct of those engaged in it, I think."

"How inconsistent! the thing proves itself; if they worked too hard, how could they sit up ever so long to hold a meeting, I should like to know? Graham in the chair, too—just look after Graham, then, and see how he does his duty, will you? I saw Vincent stop him this morning, and say something angrily, but I don't know what; so just be careful, and do as I ask—good evening."

Mr. Smith lived out of town, and did not generally stay till this hour, but having some business with his partner, he was obliged to take this, the only opportunity, for a private interview.

Mr. Johnson had not long been a partner in the

house, and he had yet a vivid remembrance of his own hardships; still too he longed for leisure to read, so he secretly favoured the movement among the young men, but, in consequence of his subordinate situation, thought it prudent, at least for the present, to conceal his sentiments on the subject. He was very tired, though his duties were lighter, and his hour of beginning later than those of the inferiors; he threw himself on a couch by the fireside, and shut his eyes; insensibly he fell asleep, and was awakened by a dream in which he distinctly heard his partner resolve never to shut up at all; a position less dreadful would not probably have broken his slumbers, but he merely awoke to resume them, for he retired directly.

Poor Graham sat up late into the night writing to his mother and sister; his heart was full enough, yet he was a long time filling his paper, and, when he had done, he said to himself, "There's an air of restraint in it I don't like, but I cannot tell her the whole truth, and say I feel ill, and am getting less strong every day; no, no, that would break her heart and poor Anne's too, so it must go, I suppose." Having sealed his letter, he was soon asleep with the rest, and had dreams of his sunny country home, his gentle mother and beautiful sister; dreams of his father's grave, and the many peaceful evenings he had spent tending the flowers on it; dreams which were of heaven no doubt, and sent in mercy to his pillow.

His mother and sister were sitting together by the fire, and Anne had the letter to which we have alluded in her hand; she was a beautiful girl, perfectly pale, like a statue of Parian marble; her black hair was simply parted on her forehead, whence it fell all around her shoulders in natural curls; a touch of melancholy was on her features, and there was a gentle sadness in her voice. Poor child, her father had been dead long years, she had seen her widowed mother pressed hard by the grim hand of poverty and disease—no wonder she had a sadness on her lip and in her eye. She was poorly dressed, and so was her mother, but both were neat.

"Dear mother, put the work by, while I read John's letter; you will enjoy it so much more if you do; now let me persuade you."

"Indeed, my child," said her mother, with her fingers moving like a lightning flash, "I must not, I have to finish this work to-night."

But the widow was presently compelled to put it down, by a suppressed scream from Anne, who had fallen back in her chair, fainting.

When she at last recovered, she sobbed out, "O mother, I can bear anything but this bitter struggling for bread; let us live in the green fields where there is no work to do. I cannot see your face grow paler and paler with sitting to work, while God has scattered the means by which health may be attained so thickly around us. I have thought much about it, and something must be done; dear mother," continued Anne, a sudden idea flushing her beautiful and excited features, only to leave them the paler. "Could I not earn more in London by my work than here; and then, perhaps—O, if I could hope that, it would be the happiest thing in the world—perhaps you need not work at all, mother."

The weeping mother kissed her child, and, having persuaded her to go to rest at once, sat down by her bedside, and read John's hopeful letter. For this indulgence the poor woe-worn widow paid by sitting up late into the morning to complete her task.

At last she lay down by her child, and slept in peace. Vivid memories of her early and happy married life wreathed her pale lips in a gladder smile than they

ever gave waking. O sleep! thou death of woe and life of joy! how art thou courted by the poor and wretched! thou weighest down the eyelids fevered with tears, and seemingly so restless; thou stillest the palpitating heart, banishest the sighing of the sad, and gildest even the brow of health with a lovelier beauty. So this couple might have felt—this mother and her child. Anne's dark hair strayed over her white pillow, her cheek was flushed with sleep; well might her mother, gazing on her in the pale moonlight, ejaculate, "angel of beauty," and clasp her yet more fondly than before.

A very different scene awaits us now. In a morning room splendidly furnished sat the young lady with whose appearance my tale opens, her brother, and father. She sat in the shadow of the rose-coloured curtains, and certainly had made no mistake when she said that colour suited her complexion. The morning sun cast the rich hue of the damask on her face. She was dressed in simple white, with a bouquet of violets in her bosom, and was making breakfast. The table was elegantly laid out, yet with no vulgar superfluity. There was no lack of conversation, for all three had lively spirits, and the young lady's ethereal temperament must have gladdened a stoic.

"Dear papa, was it not a pleasant party last night," said she, "and don't you think Jane Edwards' lover a very handsome young man?"

"His forehead is too low, and his hair scarcely dark enough," interrupted her brother.

"Be silent, Charles, I beg. I am well aware that it is an impossibility for one gentleman to hear another praised without making an objection; let your's be mute dissent now. Don't you agree with me, papa?"

"My dear Adelaide," said Dr. Leeson, "you lay down an invariable rule of conduct for gentlemen, and immediately ask me to transgress it—scarcely complimentary, my love."

"I should have said *young* gentlemen perhaps," answered she; "now, papa?"

"Well, Adelaide, he is very goodlooking; and what is of infinitely greater importance, his character is truly admirable."

"Perhaps," continued the young lady, "you think his brother handsomer than himself."

"Certainly, Adelaide, you are the best judge there," said Dr. Leeson, "you had him all to yourself the greater part of the evening."

"O papa, that is too bad—I did not indeed—how very odd to say that."

"Odd or not, I maintain papa is correct, Miss Adelaide," said Charles, playfully; "it was just as it happened at Mrs. Cecil's the other evening. Come, papa, it is time we were leaving, it is nearly nine."

After an affectionate adieu, though they were to meet again to dine at five, Dr. Leeson and his son went to their professional duties, and Adelaide was alone. She was surrounded with every element of happiness, and hers was a nature to apply them to the benefit of herself and others. To please Charles, whose pet study was painting, she went on with a group of flowers she had begun for him. For her father she practised his favourite songs, and she went from one light employment to another, with the gaiety of a spring-bird. Presently a friend sent her some flowers, and she replenished the vases on the mantle-piece—an employment she never allowed any one to usurp. She was just putting the last rose into a beautiful porcelain ornament, when a servant announced Captain Mortlake. He came from Miss Edwards, to bring with her love a pledge of friendship. This "pledge of friendship" created no small embarrassment between the two young people, when it was taken out of the paper in which it had been sealed up.—Attached to a delicate gold chain was a miniature portrait of the Captain himself! He was brother to Jane Edwards' intended husband, and the handsome gentleman who had engrossed the conversation of breakfasttime.

"How mischievous Jane is!" said the young man blushing; "I wondered why she borrowed the original miniature from my brother, but now I see. The chain she bought in Venice when we were there last May: is it not delicate?"

"Beautiful! How very fine the work is! the Venetian chains are celebrated for their beauty, I know. I am sure the report does not exceed the reality."

The Captain, being very much embarrassed, took pity on Adelaide who was not less so, in consequence of the strange present of which he had been the unconscious bearer, and soon took his leave.

After he went, Adelaide sat some time with the beautiful little painting in her hand. How noble were those features, and how pure and good the expression! It was set in pearls, but really the jewels added nothing to the value of it in her eyes. She began to think that perhaps she had a little, only a little, prepossession in his favour. She replaced the portrait in its velvet case, and took it up stairs to put it away among her treasures; she should never wear it of course, that would not do; but she was glad to have a vivid representation of those noble features perpetually at her command. Many a time that day was one drawer opened. She loved the original better every time she gazed on the representation, and thanked Jane in her heart, though she resolved to scold her openly, for sending her such a thing. The Captain was more candid about it, and thanked his sister-in-law elect for the kindness she had shown in becoming thus his pioneer with Adelaide; but playfully reproved her for the love of mischief she displayed in making him the bearer of his own portrait to a lady he had only seen half a dozen times in his life.

The next day, Jane and her betrothed being very busy about their house, furnishing, &c., the Captain resolved to devote his morning to the fair lady who had made a deep impression on his heart; he arrived just as her brother and papa had left. She was alone, simply dressed as on the preceding day, but with one white rose in her beautiful black hair. She was folding up the newspaper to put it away till papa's return, when the name of Captain Mortlake caught her eyes; it was prefixed to a speech of considerable length on the subject of unnecessarily late hours of business. She sat down to peruse it, and as she read how shamelessly ladies waste the time of the shopmen in haberdashers' establishments, Captain Mortlake entered, and she was surprised with the blush of conviction on her cheek. She hastily laid down the paper and welcomed him, and though his quick eye had caught sight of what she had been perusing, he said nothing about it. But Adelaide could not help turning the conversation on that subject. "Do you really believe, Captain Mortlake, that these young men are overtasked? it seems such an easy employment for a man to stand still all day and handle silks and ribbons."

"It seems easy," said the Captain, "to ladies who do not know how hard work it is; but there is no position which becomes painful sooner than standing, and it is really unnecessary that persons should purchase, things of this kind at any rate, at such late hours as we find they do."

He spoke with some warmth, and Adelaide said, "But I never go shopping in the evening, and therefore am not implicated in the censure implied by your observations."

"No one," replied the Captain with unaffected emotion, "who knows Miss Leeson suspects her of any thing ungenerous, and none can admire, more than I, the admirable precision with which she performs those household duties which unhappily devolve upon her. Not that I view the management and direction of an establishment as unpleasant to any right-minded lady, but you have them to perform sooner than the ordinary course of nature would have led us to expect."

"Pray say no more," said Adelaide, her eyes filling with tears at the remembrance of her mother. "Now tell me in what possible way I can be implicated?"

"Since you insist on knowing, I will say that you leave your servants, perhaps, no opportunity of purchasing what they require," replied he, "but a few minutes late at night, and this is one cause of the continuance of the evil, after all has been said, and done, and written against it; and you may inconsiderately sometimes give a great deal of trouble yourself, and then come away without purchasing." Captain Mortlake blushed deeply as he said this, for he would have done any thing except conceal or disguise his principles, rather than give pain to Adelaide. She was a kind-hearted girl, but she did not relish this reproof, mild as it was, and so she set herself in array against the principles advocated by her admirer.

"Well, Captain Mortlake, after all, I do not see that drapers' shopmen work harder than other tradespeople; as to late hours the people can shut up when they like. I think it ridiculous to interfere."

Captain Mortlake resumed, "There is some excuse for people to keep late hours when they sell provisions and such necessary things, but I think not the shadow of a shade, for linen-draperies. But as I despair of persuading you by this kind of argument—consider what a boon it would be to those young men, to have an hour or two of an evening to spend at books. Think too, that at least some of them will one day be rich and influential men."

"And then," interrupted Adelaide, laughing, "having had the advantage of experimental knowledge of the system you condemn, they will be better men for you. Now let us say no more about this nonsense."

"Very well, Miss Leeson, then I will bid you good morning."

"Good morning."

There he stood again on the steps of the house which contained all that was dearest and fairest to him in life. He had determined to spend three long hours with her, and to endeavour to make her discover something of his love; but now he was farther than ever from this. He walked on with his eyes on the ground, wondering whether he might not have said what he had said in a gentler way, but, to his honour be it recorded, never regretting that he had avowed his opinions, although, perhaps, he felt sorry that he had so suddenly taken his leave. He had the uncomfortable feeling of having lost something valuable, but what, he could not tell. At last he reached home, (he lodged with his brother in a pleasant house in Clapham;) and then sat down, leaned his arms upon the table, and bent down his fine head upon them for very desolateness. To his jaundiced mind his brother's happiness appeared selfish, thoroughly selfish. He sat for hours, and then suddenly got up to prepare a speech for a meeting which was to take place that evening, in defence of the principles so ridiculed by Adelaide. Would it have been strange if he, a young man of birth and wealth, had in such circumstances turned his back on his toiling brethren, and been happy in the love of Adelaide? If such a thought glanced across his mind he banished it directly; and those who heard him speak that evening sympathised with his supposed ill-health, when he rose with a pale cheek and agitated features. But they felt their heart's blood grow warmer, and more capable of brotherly love, as the speaker poured lavishly before them the treasures of his rich mind, and cultivated imagination.

Well earned were the ringing cheers that made the roof of their place of meeting echo—hardly earned, for the heart within the orator reproached the boldness of his tongue, and vainly tried to restrain it by fears of losing the love of the beautiful Adelaide. After he had finished he left the meeting, and sunk again into his desponding posture of the morning.

Adelaide felt guilty after Captain Mortlake left her. She knew she had done wrong in answering flippantly about a practice, which, whether good or bad, was of considerable importance to hundreds of her fellow-creatures. She called up her lover's look of reproach, his gentle manner, and hurriedly ran up stairs. Having taken
